'No disgrace to you, sir, that you've not,' returned Jerry, in the same cautious tone as before. 'By Heaven's mercy, they are oftener talked of than felt! He' jerking his thumb towards the hatchway of the captain's cabin—'never came in for one either, and struck me, and cursed me for a Jonah, when I begged him to let go another anchor, that we might have at least a chance of riding it out. You'll see a pitiful sight, sir, presently—that is, if you are spared. Them junks and proas might as well be nutshells when the rollers set in. And look at the Yankee captain, how he keeps his ship, the canvas brailed, not reefed, and cloth enough set to carry her and all aboard into the next world, as it's likely to do before morning!'

The old man shuffled off, and I felt exceedingly uncomfortable. With Captain Harris, since he had given way to his unlucky habits of drunkenness, I was not on very cordial terms, nor could I hope to bring the sullen, half-intoxicated commander of the vessel to take precautions against the coming evil. Nor was I quite sure that the evil would, after all, come to pass. The cat's-paw that had roughened the water had passed away, and all was bright again, save where the leaden-coloured streak lay to seaward. I opened my heart, however, to the first-officer, Mr Ernst; but although the civil-spoken young German heard me patiently to an end, and looked intently out for signs of a storm, I could not induce him to press his advice upon the skipper, or to take on himself the responsibility of dropping another anchor. On one point, a minor one, I did prevail. The top-sails were hanging loose from yard and clewline, and these, at my request, the mate caused to be close-reefed, a step for which, an hour or two later, we had reason to be thankful; when, on a sudden, a great bustle and noise began among the Chinese junks in the harbour. We could hear drums and gongs and wild outcries, and could see the pig-tailed mariners beating their breasts and gesticulating with every mark of terror and dismay, while from the seaward came the leaden-coloured cloud-bank, swollen until it rose skywards like a moving battlement, and preceded by a hissing sheet of snow-white foam.

'The typhoon! the typhoon!' cried a hundred

voices, and then the babel of tongues was overpowered by the terrible roar of the mighty wind as it reached us, tearing up the sea as the steam-plough cuts its furrow through loose sand, and throwing us on our beam-ends with a violence that made every timber in the *Saucy Maid* quiver and groan like some hurt animal. We righted, however, after a time, and then indeed did I witness a spectacle such as the oldest seaman but rarely beholds. Masts were snapping on every hand, as easily as though they had been the dead branches on a storm-beaten tree; cables were parting, bulwarks being washed away, and all the sea around was strewn with wreck, water-casks, hen-coops, boats, and loose spars, mingled together in pell-mell confusion.

Worse damage than this had, however, already been effected by the first onset of the typhoon, for half the native craft had foundered at their moorings, while the remainder were drifting before the gale, dragging their anchors, and in imminent danger of being dashed against the rocky sides of the haven. The European vessels were in better case, but several of them had lost booms and boats, and were tugging at their cables in a way that promised no good, unless the wind should abate. Of this, however, there seemed no prospect, since at each instant it appeared to blow harder; and as the great green rollers, crested with foam, came tumbling into the bay, I began to realise that our position was one of extreme peril. It must not be supposed that we were idle spectators of this awful scene. On the contrary, some five or six of us, Jerry being prominent, contrived to clear away and let go the best bower anchor, while even the red-eyed skipper came on deck, almost sobered by the danger. Still the strain upon the cables was a fearful one, and at every fresh jerk, as the huge waves lifted the bark, I dreaded lest they should give way altogether.

'Help, help! For God's sake, help! or we perish!' such was the startling outcry, uttered for the most part by female voices, which struck upon my ear, as a drifting vessel passed us. It was the fine American ship, *Henry Clay*, but how changed! Her entire top hamper, mast and sail, stay and shroud, had been swept away; her bulwarks, figure-head, binnacle, and taffrail, razed by the furious sea, and only her lower masts and bowsprit remained standing. On the deck, huddled together like frightened sheep, were the passengers, with some two or three sailors at most mingled with them.

'What has happened on board?' I called out, through the speaking-trumpet which I had snatched from the shaking hand of the drunken skipper. 'Where is your captain?'

'Drowned!' answered a man, who looked like a steward, speaking through his outspread hands. 'Drowned, in trying to prevent the crew from taking to the boats, which were swamped as soon as they got clear of the ship's side. Help us, sir, or we shall go upon the rocks!'

But to give efficient help was at that moment impossible, and the *Henry Clay* went past us, on her road, as it seemed, to swift and certain destruction.

Meanwhile, many of the junks floated rapidly by, their lateen sails of plaited straw or striped cotton torn and flapping, while the wretches on board wallowed on the deck, in abject fear, calling

on Fo to have mercy, and to drive away the devouring dragon of the tempest. Some of these unlucky craft were dashed against one another until they settled down in the water; others were hurled against the rocky shore, and battered to pieces. Some escaped the fatal rocks as by a miracle, and drifted on, rotating before the force of the typhoon, which gradually veered towards the south. By this time we had managed to get up from the hold a spare anchor, and to bend on it another cable, so that we had hopes of riding out the storm. The American ship, which had brushed so closely by the cliffs that a biscuit might have been tossed on shore, came drifting past once more, and again the pleading cry was heard for 'help! oh, help!'

'I cannot bear this!' I exclaimed, turning to those on board of our own vessel; 'I cannot see Christian men and women drown thus miserably for want of bearing a hand. Who volunteers to man the jolly-boat, and board the American ship?' Jerry and two English fore-castle Jacks were the first to answer to the appeal; then came a fair-haired Swede, and a red-whiskered Dane, and a mulatto lad whom I had saved from punishment for some trifling breach of duty during the voyage, and who was grateful.

Six oars, all told. There was nothing to be expected from the Lascars, benumbed by terror and the drenching spray; or from the Chinamen, stupefied in part by superstitious alarms, and in part, too, by the drugs to which they had resorted as a physical means of lulling fear. The rest of the crew were not bold or ready-witted enough to back us; but although Captain Harris offered a growling opposition to my putting 'his best hands' into unnecessary danger, some spark of manly generosity was at last kindled in the old toper's breast, and he waved his gold-laced cap as I grasped the tiller-ropes and bade the men push off, calling out, hoarsely: 'Well done, my lad! If I'd been twenty years younger, I'—

I heard no more; but I have never forgotten that picture during all the years that have since elapsed: the vessel straining at her cables, the boat rising on the crest of a giant wave, the old man, his gray hairs bared, leaning over the shattered bulwark, and waving his cap towards us in sign of adieu. But at the time I thought little of it, having need of all my steersman's art to keep the frail boat from being swamped in the terrible sea through which we had to pass. We had a desperate struggle, too, with the rollers, before we could reach the American, for the mulatto boy and Jerry were both too weak to be efficient rowers, and we were tossed and tumbled to and fro, as if the boat had been a shuttlecock bandied about between two monstrous battledores, until I encouraged the men to a supreme effort, and reached the ship. Scarcely had I set foot upon the deck of the *Henry Clay* before an unexpected phenomenon varied the elemental war. The howling wind ceased, and a dead calm succeeded, during which the wash of the sea, deep and hollow, and the far-off cries of perishing sufferers, were alone audible. There was something perplexing in the sudden transition from a shrieking hurricane to absolute stillness.

'It's only the heart of the typhoon: it won't last, sir,' observed Jerry gruffly, and I lost not a moment in doing what little I could for the security of the vessel. A jury-mast was rigged, a storm-

sail and jib were set, and two of the sturdiest men posted at the wheel. Hardly had this been done, when, with a hideous shriek, the tempest burst upon us again, this time blowing from a quarter opposite to that from which it had last made its force felt, and bore us resistlessly before it. The lady passengers, who had till then believed themselves to be saved, and had been giving thanks to Providence for their rescue, now recommenced their wails and lamentations—and indeed the situation was one of no pleasant character. The storm had begun again with fury unsated, and wherever the eye turned, there were foundering vessels and a wild white sea. We were being hurried towards a rocky headland, the most northerly point of the natural harbour of Ilina, and beyond which lay the storm-beaten ocean, with its low-lying canopy of livid cloud seeming almost to mingle with the driving scud. Were we once outside of this stony barrier, a chance of safety, though but a poor one, remained to us; whereas, if driven upon the reef, our doom was certain. I made up my mind at once to face the open sea. 'Haul away at sheet and brace!' I cried; 'set another jib, forward there; and you at the helm, keep her away, yet a point away, do you hear!'

'Ay, ay, sir!' answered the steersmen, with the mechanical obedience of trained hands; but old Jerry exclaimed cheerily, as he helped to set the new canvas: 'Mr Harland's right. Nothing like sea-room, my lads! Haul away with a will, every one of you, and get steerage-way upon her.' By the mercy of Heaven, we rounded the headland, narrowly escaping the fatal contact with the jagged rocks, and were in clear water.

Once outside the harbour, I had time to glance around me; but on looking back to the wreck-strewn bay, I could see no signs of the barque which I had so lately left. In vain I swept the horizon with my pocket-glass. I could see several vessels bravely riding out the gale, and a diminished number of the native craft passively drifting under the force of the rollers and the wind; but of the barque, nothing. The *Saucy Maid* was gone! There was scanty time, however, to wonder or to mourn over the fate of those who had been on board of her. The charge of the ship of which I found myself acting commander, through so strange and sudden a catastrophe, was no light burden. The *Henry Clay* reeled and careened to a fearful extent, as she flew along with the speed of a race-horse, cleaving her way through the heavy seas that constantly deluged her decks. It cost us some trouble to induce the terrified ladies, and such of the male passengers as age or infirmity disqualified for exertion, to go below. Of every available hand that could pull a rope or tug at the spokes of the whirling wheel, we had sore need, and even then we were weak in numbers to work so large a vessel as the American clipper, and in weather such as would have tested the endurance of the strongest crew.

The remembrance of the next three days and nights haunts my memory still, at intervals, like the confused details of a ghastly dream. I had divided the men under my orders into two watches, as usual, but for myself there was no rest, since I had no officer who could share with me the responsibility of the arduous task which had been, so to speak, forced upon me. Always on deck, through darkness and daylight, through wind and rain, I

worked hard to save the ship and the lives of those committed to my charge. It was no slight labour. The foul weather—for on the skirts of the typhoon rough seas and strong gales were encountered—was not the only enemy with which it behoved us to do battle. Some sinking junk had come violently into collision with the American three-master, and we had scarcely lost sight of the mountain summits of Formosa before the carpenter reported an undue depth of water in the well, and that a dangerous leak, beyond his powers of plugging, had been sprung. We fought long and patiently to keep back this insidious foe; the clank of the chain-pumps was incessant, and even ladies lent their delicate hands to the toil, as worn-out men reeled away for a short repose; but more than once it seemed as though the water would win the victory, while all on board were spent and weary, and it was evident that an accident such as the snapping of a link or the choking of a pump would send the *Henry Clay* to the bottom of the sea. And all this time we staggered on under such sail as our improvised masts would bear, over a howling wilderness of waves.

Fine weather came at last; the wind and the sea abated, and after some trouble, I contrived to get a spare topsail lowered and secured across the leak, keeping out in great measure the influx of the green-blue water, so that a moderate amount of labour at the pumps sufficed to free us from immediate danger of sinking. I was able, too, for the first time, to take a solar observation, and after a brief calculation as to our whereabouts, I decided to bear up for Kiusu, the most southerly island of the Japanese group, which could not, as I judged, be above two hundred miles distant. Our troubles were not quite over, for a rickety jury-mast went by the board, carrying away with it two poor fellows who were aloft to reduce sail, and who were washed to leeward and drowned without the possibility of rescue. However, the prayers of those on board the *Henry Clay* were answered, and after another eight-and-forty hours of anxiety we sighted Kfusu, where Japanese pilots came off to guide us to our anchorage.

How vividly it comes back to me now, the scene of our arrival in the peaceful bay, the shores of which were studded with neat Japanese houses, overlooked by the peaks of blue inland mountains, several vessels of various flags lying at anchor, and a flotilla of boats containing sight-seers, native and foreign, among whom were Japanese ladies with fluttering fans and silken robes, hovering around the *Henry Clay*, whose battered state shewed how narrow had been her escape from destruction. I remember, too, that some officers from a British steam-corvette at moorings in the harbour had come on board of us, and were shaking me by the hand, and congratulating me, pointed out to them as I had been by the passengers of the great ship, the ladies among whom, in their simple gratitude, insisted on speaking of me as their preserver. And then, on a sudden, my eyes appeared to grow dim, and all things swam before them, and the sound of friendly voices reached me only as a deep, indistinct hum, like that of bees, and I dropped down swooning on the deck. Fatigue and anxiety had been too much for me, and before nightfall I was tossing to and fro in the delirium of a fever.

When I recovered my senses, I found myself, weak and ill indeed, but in a fair way towards

recovery, in a cot which had been charitably assigned to me on board H.M.S. *Nautikus*. Kind nursing, a skilful surgeon, and a robust constitution soon enabled me to be on deck again; and when the corvette was ordered round to Nagasaki harbour, I was set on shore, thinner and paler than when I had left England, but well and fit for work. I found, however, with dismay, on presenting myself at the counting-house of Messrs Parker and Mills, that my post was now occupied by another.

'Very sorry, indeed, Mr Harland,' said the senior partner, screwing up his parchment face into a grimace of what was meant for sympathy; 'but, you see, men of business cannot afford to indulge in sentiment. The vessel in which you were known to have left Ceylon having been reported as lost in the typhoon, with all hands, why, of course'—

In short, under the very natural belief that I, the accepted candidate, had perished in the wreck of the *Saury Maid*, Messrs Parker and Mills had filled up the vacancy. After all, though I was not dead, I was woefully behind the stipulated time for my arrival in the merchants' office, and had no right to complain.

Of all the many foreign adventurers in that Japanese seaport, few, I suspect, carried with him a sadder or a heavier heart than I did, as I left the counting-house of those who were to have been my employers, and strolled listlessly down to the beach. What was I to do? The little cash I had would suffice to maintain me in idleness for a short time only; and then—not that I repined at the necessity—I must work for a living. A few weeks on shore, for the complete restoration of my health, I might allow myself, and then, no doubt, I should have to get afloat again as an officer on board some vessel in the coasting-trade. But, in resigning the bright hopes which had allured me to Nagasaki, I felt as though I were relinquishing all prospect of an early union and a happy home with Dora, and that was hard to bear. In no way of which I could think could I be likely to realise a speedy competence. Bread my former profession could afford me, but not, for many a weary year at anyrate, the means to marry. And Dora was too delicate to be fitted for a life of actual poverty. 'Almost better,' I muttered to myself, as, with downcast eyes and bowed head, I paced to and fro the Battery, where a Japanese sentry in a trim blue uniform was mounting guard over the bright brass cannon that peered through the embrasures.

'Almost better if I had gone down with Captain Harris and his crew in Ilima Bay, as I was rumoured to have done. Disappointment such as this can sting more bitterly than mere physical pain has the power to do. By this time, for aught I know, the news of my death may have been telegraphed to Europe, and reached Dora. What a stab to her fond little heart the tidings will be, and although they are false, yet I am a ruined man; and not for long years, if ever, can I hope to'—

'Why, Harland, Harland! Haven't you heard it? No; I see by your face, poor old boy, that you have not. Never mind! Let me be the first to wish you joy!' called out a frank, cheery, English voice, as a young naval officer, with whom I had formed a sort of friendship while on board the corvette, came up panting and laughing, and took me by the hand. 'I've been looking for you high and low,' said the good-natured midshipman;

'and so, for that matter, have Gibson and Mildmay. It's not always that fortune stands so well by a fellow who so thoroughly deserves it.' I stared in dumb surprise at the speaker, whose words seemed, under the actual circumstances of my position, to be fraught with the most cruel irony. 'We set up a rattling cheer when we heard it,' continued young Egerton, fanning his heated forehead with his straw hat; 'and old Sir Henry looked mast-headings and close arrests at us, until some one whispered that you had been a shipmate of ours, and then the admiral was mollified. The oddest thing is that you were not present; though, perhaps'—

'But why, in the name of common-sense, should I have been there? Or how, do you suppose, could all this have had any interest for me?' interrupted I, staring at my blithe young friend.

'Well,' rejoined Egerton, looking, in his turn, surprised, 'you do take your good luck coolly, Harry. It isn't often, old man, that such a wind-fall comes in any fellow's way, and I'm afraid that I should not prove so philosophically indifferent, in your place, to the good things in store for me. As it is'—

I looked at the lad with a sort of dull, puzzled wonder. He and his shipmates were, I felt assured, by far too generous-hearted to make a jest of my misfortune in losing my appointment. And yet, what a satire on my baffled hopes was this pretence of treating me as one of fortune's especial favourites! Then it occurred to me that the whole conversation must be based on some error or false assumption, perhaps owing to a similarity of name. 'Some mistake!' I faltered out, with a sickly smile.

'Not a bit of it!' said the midshipman, decidedly. 'The American commodore on the station quite concurred in the award, and the agents of the owners of the *Henry Clay* admitted it without grumbling. Why, Harland, any one would say that you were utterly unaware of your own claim, for salvage-money, on the ship you saved, and the cargo of which was of enormous value. Seven thousand pounds, I own, make up a tidy sum, but not a dollar too much, considering how near freight and ship were to Davy's locker, but for'—

I think he said more, but his voice sounded in my ears but indistinctly, and my eyes grew dim, as I reeled on my feet, and should have fallen, but for Egerton's supporting arm. When I recovered from this momentary weakness, I rallied my wits, and was able to learn the truth. It was a fact, that in bringing the American vessel safe into port, I had never contemplated the idea of any pecuniary advantage to myself. My first care, on landing, had been to seek out Messrs Parker and Mills, and to their counting-house my first visit had been paid. It was indeed news to me that the Court of Admiralty, or rather the local tribunal of the naval station, had allotted to me the large sum quoted, as my just share of the salvage of the *Henry Clay*, smaller rewards being assigned to Jerry and the other sailors. Nor was this all, for the gratitude of the passengers for their preservation from peril had led them to subscribe a sum of no less than fifteen hundred pounds as a testimonial to myself for the service rendered; and this, though with some scruples, I was persuaded to accept.

That I returned home at once may well be con-

jected; but having, in the bustle of the moment, omitted to write or telegraph the tidings of my safety, I burst into Dr Davenport's quiet dwelling at Clevestead with somewhat of the startling effect of a melodramatic ghost, and poor little Dora fainted outright at the sight of me. My darling—she was looking thin and pale, but happiness soon brought back the rose to her cheeks, and the brightness to her eyes—forgave me the thoughtlessness which had caused her some weeks of carking care; and two months later, we were married with the consent of all concerned. The money, which was in due course made over to me by the owners of the *Henry Clay*, enabled me to set up in business as a thriving ship-owner; and since that time I have commanded a fine vessel of my own, and have made prosperous voyages, but none which has effaced the memory of my desperate struggle for life on board the American ship, *Henry Clay*.

## DEEP-SEA EXPLORATIONS.

### IN FOUR CHAPTERS.—CHAPTER III.

On the 9th August 1873, the *Challenger* left Porto Praya. As it was desirable that the sections across the Atlantic should be parallel to each other, and as the next one was to be near the equator, it was necessary to reach a starting-point off the African coast to the southward, and, accordingly, a southeasterly course was shaped, parallel to the shore. The time was not lost in thus getting into position, as soundings were taken from day to day. On the 16th, the line parted after sounding at a depth of 2425 fathoms. On the 19th, the trawl was put over after sounding, and brought up a variety of animal forms, among which were nine large shrimps of a brilliant scarlet colour. The sea in this locality was extremely phosphorescent, and, there being no moon visible, its brilliancy was the more apparent, and fairly eclipsed the brightness of the stars. The unbroken part of the surface of the water appeared intensely black, like molten lead, whilst the crest of each wave was a line of clear, white light, and so luminous, that Professor Thomson was enabled to read the smallest print when sitting at the port of his cabin. The sails and rigging of the ship were thrown into distinct lights and shadows. The tow-net revealed pelagic animals in vast numbers, the majority of them being more or less phosphorescent.

On the 21st August the ship reached the position from which the third section across the Atlantic was to be made, and a course was shaped for St Paul rocks.

On the 23d, from a depth of 2500 fathoms, the trawl brought up some important additions to the natural history collection, three very curious fishes, one entirely without eyes, some bright red shrimps, star-fish, &c.; and on the 25th, some fishes, zoophytes, crabs, and prawns were the result of the haul. On the afternoon of the 27th, the delicate serrated outline of St Paul rocks was seen, and although the voyagers were perfectly aware of the exact dimensions of the group, the actual appearance was disappointing. The largest rock is only 60 feet out of the water, and is almost pure white, from being covered with a kind of varnish, composed of guano and sea-salt. On nearing the rocks, a boat was sent off, and a hawser having been

secured, after much trouble, the *Challenger* rode to it on the lee side of the rocks, the current running past with much force. The next day, the rocks were minutely examined, a labour not unattended with difficulty, and even danger, as the swell setting round and over the points, produced a confused sea, in which it was most difficult to land. The inhabitants consisted of only two feathered families, the *Booby* and the *Noddy*, but they were a most prolific race, for they were in myriads, and so tame that they were captured by the hand with ease. The only other animals found were a small scorpion, and a few crabs and spiders.

On the 29th, after a stay at the rocks of longer duration than any vessel had ever before made, sail was made for Fernando Noronha, which was reached on 1st September. Soundings on August 30th and 31st, and September 1st, shewed a depth of 2200 to 2475 feet, with a bottom of globigerina ooze.

It was Captain Nares's intention to make a stay of a few days at Fernando Noronha, as but little is known of its fauna, and, on the arrival of the ship, all seemed to promise a rich harvest to the naturalists. The governor blandly gave his permission for an examination of the island, when Captain Nares called on him; and extensive preparations were made for an onslaught on the animal and vegetable products of the land, and the sea that surrounded it. Whether, however, these extensive preparations frightened the governor, not being himself a scientific man, or whether that functionary suddenly became alive to his own importance, is not known, but he sent word recalling the permission he had given, and forbidding the capture, even of a butterfly. Captain Nares respectfully expostulated with him, but in vain, and as there was no object to be gained by the delay, the expedition left. Fernando Noronha is the penal settlement of Brazil, about fourteen hundred convicts being confined there; but beyond the seaboard of the island being the limit of the prison, there did not appear to be much confinement, the convicts living in detached huts, and cultivating their own little gardens. About two hundred soldiers compose the guard, and are in reality greater prisoners than those they look after; indeed, it was difficult to realise that the island was a prison, and the population felons. Some dredging was effected from the 3d to the 14th, but with no very great success. The bottom between Fernando Noronha and the Brazil coast was found to be very uneven. The deepest water obtained was 2275 fathoms, with the usual globigerina ooze.

The *Challenger* arrived at Bahia on the 14th September, and the officers were soon in great enjoyment of one of the most enjoyable spots of earth. This pleasant period, however, was of brief duration, as a case of yellow fever occurring amongst the crew, it was deemed advisable to proceed at once to sea, and get south to a temperate climate. The expedition accordingly left on the 25th, steering towards the Abrolhos shoals. Sounding was not recommenced until the 30th September.

On the 3d October, after sounding, the trawl was put over, and in heaving it in, the strain was found to be considerably greater than usual, and the idea that some great discovery was about to be made, occasioned much excitement, and numerous conjectures as to the nature of the coming prize. Unfortunately, however, just as the trawl had

reached the surface of the water, and was about to be secured, a swivel broke, and the rich prize, of whatever nature it may have been, soon resumed its position at the bottom of the ocean! On the 11th, a fine haul was made with the trawl, comprising fishes, prawns, corals, star-fishes, &c., greatly to the delight of the naturalists, and afforded some consolation for the loss they had sustained on the 3d.

On the morning of the 14th, the island of Tristan da Cunha was sighted, in 37° 6' S. lat., and 12° 18' W. long., and the next morning the *Challenger* anchored off the settlement of New Edinburgh, so named in honour of the Duke of Edinburgh, who visited the island in the *Galatea*. The group consists of three islands—namely, Tristan da Cunha, Inaccessible, and Nightingale Island. Upon the first of these is the settlement, consisting of a dozen neatly built houses, thatched with long grass, and containing eighty-six inhabitants. The property of the settlers in cattle, sheep, pigs, and poultry is considerable. These they sell or barter with passing ships; and by those who purchase from them they are found to be keen hands at a bargain, notwithstanding their isolation from the world. The community hold socialistic principles, but they tacitly admit as their head the oldest inhabitant, Peter Green, who married the daughter of the first chief, Corporal Glass. He holds more the position of father of the colony than governor, and officiates as spokesman and salesman; his opinion also is much deferred to.

The coarse but nutritious tussock-grass affords good pasturage for the cattle and sheep, and the potato is successfully cultivated, as also are cabbages, radishes, &c.; but the inhabitants are entirely dependent on passing vessels for bread-stuffs, as corn will not withstand the force of the heavy gales.

Information was received here that two Germans were on Inaccessible Island, where they had landed nearly two years before, and as they had not been visited from the settlement for a long time, it was doubtful whether they were yet alive. This information determined Captain Nares to visit the island; and on reaching it, the two men were seen, by the aid of the telescope, standing on the beach near their hut. They were overjoyed at being released from their imprisonment, and gladly accepted Captain Nares's offer to convey them from the island. Their story was a very romantic one, but as it has already been told in these pages (Sept. 5, 1874), we need only say that these two Crusoes, as they have been called, were happily relieved by the *Challenger* from their exile, and taken to the Cape of Good Hope.

From Inaccessible Island the *Challenger* went to the other island of the group, Nightingale Island, so named after a Dutch navigator who landed on it. At this island, the ascent to the higher ground is gradual on all sides. The tussock-grass is from six to nine feet high, amongst which penguins were literally in myriads. Progress in every direction was not only impeded by these animals, but almost barred, for they fiercely attacked the legs of the intruders, and their beaks being short and strong, it required a good thick boot to protect the wearer from injury. The smell in this penguinery is described as abominable, and in addition to this, the cry of the birds when disturbed

—something between that of a pig being killed and a kid that has lost its dam—was deafening, driving ardent and enthusiastic naturalists to rocks out of their reach.

The position of the island being fixed by the officers of the *Challenger*, sail was next made for the Cape of Good Hope. The weather prevented soundings being taken as frequently as was desired, but those obtained seemed to shew that a deeper channel existed on the east side of the Atlantic than on the west; but from the depths obtained at distances so widely apart, it would not be prudent to assert that such is positively the case, without intermediate observations. The *Challenger* reached the Cape of Good Hope on the 20th October.

The two most important physical results of the *Challenger's* explorations in the Atlantic Ocean relate to the contour of the bed of the ocean, and the general circulation of the deep waters. If the reader had beside him the tabulated results of the soundings of the *Challenger*, and were to mark upon a map or globe the positions by latitude and longitude, with the various depths given, and were then to draw with a pencil the contours for each five hundred fathoms from one line of soundings to another, he would find that the deepest hollow, or where the depth exceeds two thousand five hundred fathoms in the North Atlantic, commences near the coast of the United States and Bahama Islands, and then passes towards the African coast between the Canary Islands and Cape Verde Islands. With the assistance of soundings as obtained, two diverging gullies would be found running to the north, and two to the south; and it would also be observed, if the nature of the bottom were marked against each sounding, that wherever the depth reaches about 2250 fathoms, its character gradually changes from the usual gray-coloured globigerina ooze to reddish, and finally, in the deepest water, to red-brown mud or clay. (This mud is of so fine a nature, that when disturbed, it remained several days in suspension, giving the water much the appearance of chocolate.) These remarkable alterations in the nature of the bottom were duly observed and noted; and by a careful series of observations of the progressive change from globigerina ooze, it was found that the shells of the globigerina gradually lost their sharpness, and assumed a kind of rotten look and a brownish colour, this rotten appearance increasing until the lime of the shells disappeared, leaving the impalpable powder described. This discovery has a very important bearing on geological science.

One of the primary objects of the expedition was the ascertainment of the temperature of the ocean at various depths, and this, as we have already partially shewn, has been carried out with remarkable care and minuteness of observation, adding greatly to our knowledge of the great system of ocean circulation. The manner in which the results have been obtained is not easily described without the aid of diagrams. Suffice it to say, that beyond all doubt it is proved that the cold water, which is recorded as being in temperature but little above the freezing-point, is derived from a polar source, as was demonstrated by Dr Carpenter from the observations obtained in the *Porcupine*; that, as the water is shoaler between the deep water of the North Atlantic and the North Polar basin, the bottom water north of the equator is

derived from an antarctic source, and not arctic; and also that at the equator, notwithstanding the great increase in the heat of the surface-water, the temperature decreases more rapidly with the depth than outside the tropics; thus, with a surface temperature of  $78^{\circ}$ , at a depth of 60 fathoms, the temperature is  $61.5^{\circ}$ , the same as at Madeira at the same depth; and at the depth of 150 fathoms at the equator, the temperature is similar to that at the same depth in the Bay of Biscay.

After the ship was thoroughly refitted and prepared for the stormy weather she was likely to encounter in the southern seas, the expedition left Simon's Bay, Cape of Good Hope, on the 17th December, and commenced sounding operations at once.

Some examination of the Agulhas current was made, but the stormy weather and heavy sea prevented as many observations being made as were wished, and, as time was an object, further investigation was given up, and the ship made the best of her way, with the usual strong westerly winds, towards Prince Edward Island. On Christmas-eve, the weather was thick and misty; but on the afternoon of Christmas day, the mist cleared, and Marion Island was seen, and soon after Prince Edward Island, the peaks of both being shrouded in clouds.

On the following day they stood in for the north side of Marion Island, running along about two miles distant from the shore, looking for a spot where a landing could be effected. This was found on the lee side. The island appeared rough and inhospitable in the extreme, formed apparently of flat terraces of black volcanic rock rising to a height of 4200 feet, the summit being a succession of rugged nipples, with one roof-shaped peak very slightly elevated above the rest.

The landing was rather hazardous, but it was effected without accident. When *terra firma* was reached, a scene of wild desolation, such as is seldom met with, was spread around, the huge blocks of black stone washed here and there by the force of the sea, giving the idea of cyclopean buildings in ruins. It happened to be the breeding season of the albatross, and vast numbers of these beautiful birds were scattered over the land, having the appearance at a little distance of a flock of sheep grazing. Their nests, which consist of circular mounds of mud and grass about eight inches high, and a foot in diameter, suggest the idea of miniature round forts, the tops being slightly concave; on these the birds, after laying a single egg, take their position. They were very tame, and took but little notice of the intruders, so that many fine specimens, both of the birds and their eggs, were captured.

Three kinds of penguin were found here—one being the king penguin. It is a curious fact that the female of the king penguin makes no regular nest to hatch her young; but, on being disturbed when sitting, carries the egg between its legs in a fold of the skin, and again sits where she stops. This bird is closely followed by the sheath-bill, for the sake of the egg, which becomes its prize if the mother bird leaves it for a moment unguarded.

Some observations having been made for fixing the position of the island, all embarked in safety. It was intended to land on Prince Edward Island the following morning, but a strong breeze springing up compelled the ship to keep from the land; they, however, obtained some excellent hauls with the dredge, and in the evening bore away for the

Crozets Islands. Here the state of the weather and the heavy sea running prevented any attempt at landing; but one curious phenomenon was observed, which has had much to do with the partially successful observations of the transit of Venus, since made at Kerguelen Land. On approaching Possession Island, the sun was shining continuously on its south-east part, and the ship passed suddenly out of the fog into clear weather, with scarcely a cloud to be seen, the fog left behind looking like a wall, and the peaks of East Island, to leeward, being seen above a dense band of white fog. It was thus proved that the lofty hills of Possession Island had the power of dispersing the fog as it passed, so that whilst the weather side of the island was enshrouded in mist, the lee side was free from it. It was also observed that no albatross' nests were on the misty side, but that the clear part was thickly covered with them.

No seal-fishing is now pursued at the Crozets, and it is much to be feared that the indiscriminate slaughter of these animals will lead, if it has not already led, to their extermination. It having been found impossible to effect a landing, the *Challenger* bore away for Kerguelen Land, and anchored in Christmas Harbour on the morning of January 7, 1874.

Kerguelen Land, sometimes better known as the 'Desolation Island' of Captain Cook, is about ninety miles long, and half that distance in breadth, but the coasts approach so near to each other in some places, that the isthmuses which separate them are termed 'haulovers' by the sealers, from the facility afforded in getting from one coast to the other by hauling their boats over.

As the object of the visit of the expedition to Kerguelen Island was partly to ascertain the best locality for observing the transit of Venus, the ship did not remain in Christmas Harbour, but proceeded the next day to Accessible Bay, and came to in the snug anchorage of Betsy Cove, or, as it is generally called by seal and whale hunters, 'Pot Harbour,' from the fact of its being a place of general resort to render the blubber into oil. The *Challenger* remained a week at Betsy Cove, and, during her stay, a survey of the anchorage ground was made. Several large sea-elephants were also secured, dissected, and headed up in casks to be sent to England. Three or four schooners are engaged here and at Heard in sealing and whaling, one of which surprised the voyagers of the *Challenger* by its arrival at Betsy Cove. A bark annually calls from the United States to collect the proceeds of the fishing.

From Betsy Cove, the *Challenger* proceeded to Royal Sound, and anchored in Three Island Harbour, a beautifully secluded spot, with magnificent wild scenery. As much surveying was done as the weather would admit, whilst the naturalists were dredging, botanising, and collecting. At Royal Sound, it was determined to fix the stations for observing the transit of Venus; and not only did the English expedition for that purpose take up its position on its shores, but that also of America was established in another part of the sound.

## THE PROTECTION OF WILD BIRDS.

SOME time during the session of 1872, a measure was passed quietly through parliament, which has not received the attention it deserves, especially from those—and we hope their name is legion—who take an interest in our native wild birds. The bill is entitled, 'An Act for the Protection of certain Wild Birds during the Breeding Season,' and is technically known as 35 and 36 Vict. chap. 78, and is no doubt intended as a very natural supplement to one passed in a previous session, of a similar kind. This was entitled, 'An Act for the Preservation of Sea Birds,' June 24, 1869, and states: 'Whereas the sea birds of the United Kingdom have of late years greatly decreased in number; it is expedient, therefore, to provide for their protection during the breeding season' 'Be it enacted, that the words "Sea Birds" shall, for all the purposes of this Act, be deemed to include the different species of auk, bonxie, Cornish chough, coulteneb, diver, eider-duck, fulmar, gannet, grebe, guillemot, gull, kittiwake, loon, marrot, merganser, murre, oyster-catcher, petrel, puffin, razorbill, scout, smew, solan goose, tarrock, tern tystey, and willock.' Any person convicted of taking, wounding, or killing any of the birds named, between the 1st of April and the 1st of August in any year, shall pay a sum of money not exceeding one pound, 'provided always' (a proviso intended doubtless for the protection of those who make a livelihood by rock-fowling upon the precipitous ledges of St Kilda, Bass, &c.) 'that this section shall not apply where the said sea bird is a young one unable to fly.'

The Act we are now considering, passed in 1872, for the protection of another class of birds, is full of the strangest inconsistencies. The proverbial coach-and-four which is said to be drivable through almost any act of parliament, may easily be run through this one, without much skill on the part of the driver. When we consider many of the names included in the favoured catalogue, and the large number of familiar friends left out, we confess ourselves unable to reconcile the act with

a measure of impartial justice to all, or nearly all, our feathered friends. The Act is a very short one, and states briefly: 'Whereas it is expedient to provide for the protection of certain wild birds during the breeding season, from the 15th March to the 1st of August every year: any person who shall knowingly or with intent, kill, wound, or take, or expose, or offer for sale any of the wild birds enumerated in the schedule, shall, on conviction before a magistrate for a first offence, be reprimanded and discharged, on payment of costs and summons, and for every subsequent offence such sum of money as, including costs, shall not exceed five shillings.' It also declares that the words 'wild birds shall for all its purposes be deemed to include the birds specified in the schedule;' and the schedule list, which is a curiosity in its way, is as under.\* This list contains seventy-nine names; but as some fortunate individuals are named two or three times, the same bird having various local names, as the curlew, with its Border cognomen whaup—the lapwing again as pewit—the stone-curlew as thicknee—both coming in again under the family designation plover, the actual number of birds protected is considerably reduced. All that noble order, Raptors, or birds of prey,

\* Avocet, Bittern, Blackcap, Chiffchaff, Coot, Creeper, Crossbill, Cuckoo, Curlew, Dotterel, Dunbird, Dunlin, Flycatcher, Godwit, Golden-crested Wren, Goldfinch, Greenshank, Hawfinch or Grosbeak, Hodgesparrow, Kingfisher, Landrail, Lapwing, Mallard, Martin, Moor (or Water) Hen, Nightingale, Nightjar, Nut-hatch, Owl, Oxbird, Pewit, Phalarope, Pipit, Plover, Ploverspage, Pochard, Parre, Quail, Redpoll, Redshank, Redstart, Robin Redbreast, Ruff and Reeve, Sanderling, Sand Grouse, Sandpiper, Sea-lark, Shoveller, Siskin, Snipe, Spoonbill, Stint, Stone-curlew, Stonechat, Stonehatch, Summer Snipe, Swallow, Swan, Swift, Teal, Thicknee, Titmouse (long-tailed), Titmouse (bearded), Wagtail, Warbler (Dartford), Warbler (Reed), Warbler (Sedge), Whaup, Wheatear, Whinchat, Whimbrell, Widgeon, Woodcock, Wild Duck, Woodlark, Woodpecker, Woodwren, Wren, Wryneck.

with one judicious exception, are rigidly excluded from all participation in the benefits of the law, which gives it the appearance of having been passed to aid indirectly the preservation of our game birds, such as the partridge, grouse, and pheasant. The exception referred to is that useful but too often unappreciated, owl, whose protection, during part of the year, may do something to counteract that strange obliquity of vision, which so often possesses the agricultural mind with a burning desire to convert an active *living* benefactor into a *dead* glass-cased ornament of the parlour mantelpiece. The magpie and that handsome but somewhat noisy bird the jay, receive no quarter in the bill; but are they not strongly suspected of a sneaking predilection for poached eggs? The phalarope, a comparatively rare bird, that is usually reckoned to visit our shores only in winter (when the Act is not in force), figures amongst the favoured few, as do also the teal, the widgeon, and the wild duck; but a wild-goose chase may be started any time all the year round. Any one who can manage to get within shooting distance of the stately flying heron, may stop his majestic flight, and hush his screeching voice without restriction; but the 'bittern's quavering trump on high,' as Hogg puts it, can be sounded during close-time with impunity. The common dipper or water-ousel, that the loiterer by any unfrequented stream may see darting rapidly past—the white breast glancing like a sheen of light—or diving under the water in search of water-beetles, caddis-worms, and other insects, is denied protection, probably because he is thought to have a partiality for the ova of trout and salmon; whilst the kingfisher, that lives almost exclusively on fish, receives the benefit of law. If the kingfisher is as delicate in his taste as he is brilliant in colour, he will, no doubt, like a sensible fellow, help himself occasionally to a dainty bit of young salmon, seeing that the law allows him by no means little bill a free run for four months every year, without fear of being taken up by the keeper and brought before the squire.

The nearest relatives of the water-ousel, the thrushes, are all left out in the cold by this so-called protector of wild birds. This is not a matter of much consequence, so far as some of the family are concerned, such as the fieldfare and the redwing, that only visit us in winter, and leave us again early in the year for breeding purposes; but that the missel-thrush, or storm-cock as he is sometimes called, that splendid soprano the song-thrush, and the blackbird with his rich contralto, should be excluded from the list, is a mystery which is perhaps intelligible only to gardeners. Independent of their musical throats, the invaluable services these pretty songsters render to man in spring and early summer, by ridding his fields and gardens of innumerable snails, grubs, caterpillars, and other voracious devourers of vegetation, ought surely to condone their offences in the garden when the fruit is ripe and tempting. The Ettrick Shepherd, in one of his most musical songs, warbles:

There the blackbird bigs his nest  
For the mate he loves to see;  
And up upon the tapmost bough,  
Oh, a happy bird is he!

which is no doubt true as well as poetic; but his

happiness would certainly not be increased if he knew that his mate and her dusky brood were denied that shelter of the law enjoyed by the fussy little wren with her crowded but beautifully constructed dwelling in the adjoining thicket, whose family make up in number what they lack in size.

The large tribe of finches receive scant recognition in the Act; though why the hawfinch, with a well-known appetite for peas, should have a legal standing denied to the sweet singing linnet, the sprightly bullfinch, and that dapper little dandy the chaffinch, with his bold defiant strain, one cannot understand. The buntings are all unrecognised; even that bright fitting ornament, the plaintive-dittied yellow-hammer, who in summer-time sings from the hedgerow for

A little bit of bread, but no-o-o cheese,

as are also some of our finest warblers, like the lively and melodious white-throat. That indefatigable worker, the starling, whose incessant industry in supplying the craving appetites of his hungry brood with slugs, caterpillars, worms, and the larvae of many destructive insects, ought to place him in the British farmer's list of valued friends, is left to defend himself, his mate, and progeny, as best he may.

Of the many varieties of our native titmice, only two, the long-tailed and the bearded, are admitted into the charmed circle of the law. The great tit, the crested, the cole, the marsh, and that amusing little mountebank, the blue titmouse, whose special vanity is a bit of suet, are all subject to an exclusive distinction, as invidious as it is unaccountable. Writing of the diminutive blue titmouse, the Rev. J. C. Wood says: 'Being almost exclusively an insect-eating bird, and a most voracious little creature, it renders invaluable service to the agriculturist and the gardener, by discovering and destroying the insects which crowd upon trees and plants in the early days of spring, and which, if not removed, would effectually injure a very large proportion of the fruit and produce. In the course of a single day, a pair of blue titmice were seen to visit their nest four hundred and seventy-five times, never bringing less than one large caterpillar, and generally two or three small ones. These birds, therefore, destroyed on the average upwards of five hundred caterpillars daily; being a minimum of fifteen thousand during the few weeks employed in rearing their young.'

Perhaps one of the most singular anomalies of the Act is found in the fact that, though the comparatively obscure sea-lark, the not very common woodlark, and the merry little titlark—under the name of pipit—are all protected during incubation, that universal favourite, the skylark, is left to the tender mercies of any wandering vagabond! The skylark, who is not only an exquisite singer in himself, but the cause of song in others—some of the finest lyrics in our language owing to him their theme and inspiration—is denied the grace accorded to the grating corn-crake (landrail). Nineteenth-century legislative wisdom has practically outlawed the

Ethereal minstrel! pilgrim of the sky,  
of Wordsworth; the

Bird of the wilderness,  
Blithesome and cumberless,

of the Ettrick Shepherd; and the 'blithe spirit' invoked by Shelley to

Teach me half the gladness  
That thy brain must know,  
Such harmonious madness  
From my lips would flow,

The world would listen *then*, as I am listening now.

Poor skylark! thy opportunities of discoursing eloquent music seem to be growing gradually less. What with the increasing demands of the half-sated epicure, and the rapid advance of that typical implement of modern agriculture, the mowing-machine—a veritable car of Juggernaut to the inhabitants of our meadows—thy chances of life become daily less and less.

Many of our feathered favourites omitted from this capricious catalogue have no doubt been left out under the impression that they were neither the friends of the farmer nor the gardener; but the example of some of our continental neighbours ought to warn us that a system of bird-repression is almost sure to be followed by a policy of preservation, the ravages of teeny insects being far worse than any committed by their natural destroyers. As the 'Old Norfolk Farmer,' in his valuable work on *Agriculture, Ancient and Modern*, wisely remarks: 'What would not the farmers of Australia and New Zealand give if our farmers could transport a whole colony of sparrows and other birds to those regions, where the insects exist in such multitudes as, in some seasons, to eat up everything eatable.' To this we answer—now that these birds have actually been acclimatised at the antipodes—'their best thanks.'

Finally, the Old Farmer sums up his long experience in words we heartily commend to the earnest regard of every one interested in the subject, by saying: 'We have long come to the conclusion, that the small birds do more *good* than *harm*, if attention is paid to them at those seasons of the year when the seed-corn is exposed, or the crops are ripening. An active lad on each side of a field, and a few scarecrows in the middle, will do much to abate the mischief, especially if seconded by a gentle shot occasionally from the farmer himself.'

In corroboration of the eminent authority just quoted, the writer has a letter from a Cumberland farmer who has long made the habits of our native wild birds the subject of careful and intelligent observation. He bears emphatic testimony to the preponderance of good over evil done by them to the farm generally, though he admits the ill they do at certain seasons is very trying to the bucolic temper. The rook is a sad sinner in this respect, destroying in a few hours the result of many days of the husbandman's patient labour in the turnip and potato field. Yet he more than compensates for any injury he does by his systematic destruction of that terrible scourge, the wireworm. Our Cumberland friend, carefully observing the ever-varying operations of nature, and thereby giving an additional zest to his daily farm occupations, makes even the wood-pigeon not so bad as it is usually supposed to be. Of two wood-pigeons shot in a barley-stubble field, he says: 'Seeing their greatly distended crops, I had the curiosity to count the grains of barley they contained, and found in the first, eight hundred and twenty grains, and in the second, nine hundred and fifty-six grains, of a very fair sample.' As a set-off, however, to this excessive gluttony 'all among the

barley,' he continues: 'In many of their crops I have found the seeds of various kinds of weeds that are very injurious to the growing corn. Of these seeds, there is not the least doubt but that they pick up a large quantity, and, by so doing, do a deal of good. I can safely say, that any ill we suffer from wood-pigeons on this farm is not worth mentioning; but I have no doubt it may be different where there are large woods.'

Surely one of the most palpable oversights in this unequal piece of humane legislation is the fact, that though certain birds are protected during incubation, no provision is made for the preservation of their eggs. Though by this omission the birds are only half-protected, the Act is no doubt well intentioned, and in the right direction; and if the word *certain* were struck out, and the schedule list itself withdrawn, it might then be made to include *all* wild birds, with clauses empowering farmers, gardeners, and others to protect their crops and fruit, at critical periods, from the ravages of those birds that appear at certain seasons to shew a destructive disposition. Dame Nature would then maintain her own proper balance of bird and insect life.

## WALTER'S WORD.

### CHAPTER XXXVIII.—ON PAROLE.

THE apprehensions of Walter respecting the future fate of himself and his companion were, happily for the latter, by no means shared by Mr Brown. Even when made to understand that there would be some difficulty in getting the ransom into the hands of Corrali, he could not conceive but that he would be willing to wait for days, and even weeks, for a sum that must needs appear to him indeed 'beyond the dreams of avarice,' and which he himself had been occupied for twenty years in amassing. He was not, it is true, so incredulous regarding the audacity of brigand behaviour, as during the first twelve hours of his capture; but he did not believe that they would proceed to such extremities as those at which the brigand chief was wont to hint. When, as often happened, the camp was short of food, under which circumstances the prisoners' fare was neither better nor worse than their captors', the merchant was more depressed than in the days of plenty; but otherwise, and provided the night's march had been of moderate length—for they always migrated to some new spot as soon as the moon rose—he was cheerful, and generally inclined for talk with Walter. They had been now a week up in the mountains, without any news from Palermo, and during that period, besides repeating those favourite fragments of his autobiography respecting his early struggles with which his companion was already acquainted, he had become unexpectedly communicative with him concerning his domestic affairs. It was easy to see that Sir Reginald Selwyn, Baronet of the United Kingdom, was no longer an object of admiration with his father-in-law, and his antipathy towards him obviously increased with every day's delay in the arrival of the ransom. A man of business would have got the thing managed within twenty-four hours of the receipt of the authorisation, he would say; and a man of courage and action, such as Sir Reginald had the reputation of being, would have seen that the troops had made short work of the brigands, and procured their release

that way ; but as it was, nothing was done, and there might just as well be no Sir Reginald in existence. Of course, it would have been easy for Walter to have inflamed the old merchant's mind against his relative still more, by merely relating the truth about him, but he did all he could to discourage the topic ; yet he could not help learning some particulars of the voyage from England in the *Sylphide*, which certainly shewed the ex-dragon in no favourable light. In that limited sphere of existence, and always under the eye of his companions, Sir Reginald had not been quite so successful as at Willowbank in concealing his true character. His harshness to Lotty, which her sister's eyes had long detected, had become visible to her father's also, who had not hesitated to express his opinion on the subject ; the baronet, too, in a moment of ungovernable ill-temper, had expressed his own, which was to the effect, that persons in business had better stick to their business, for which they alone were fitted, and not interfere with officers and gentlemen in matters of behaviour, of which they were not qualified to judge. There had been, in fact, what Mr John Pelter would have designated as 'a rough-and-tumble' between the old merchant and his son-in-law, and though the quarrel had been patched up, the sticking-plaster had evidently been inefficient.

'I am not a man to be blinded by the glitter of a title, Mr Litton,' said Mr Christopher Brown, 'and you will remember how, from the very first, I opposed myself to poor Lotty's marriage with this gentleman. It would have been better for my own peace of mind, if I had been less soft-hearted, and refused to countenance it at all. It was wrong in me, as a matter of principle, in my position as a father whose wishes had been placed at defiance. The money that that fellow has had out of me in one way or another,' added he, with an irritation that took his would-be dignity off its legs, 'would astonish you, Mr Litton ; and my impression is, that that money has been thrown away.'

So frankly, indeed, did Mr Brown converse about his domestic relations and private affairs, that Walter, feeling it was only to the circumstances of their position that he owed this confidence, and that in case the merchant should regain his liberty he would repent of his candour, was quite embarrassed, and did all he could to turn the conversation into another channel. He questioned him about the time he had spent at Palermo—and, strangely enough, Mr Brown never reciprocated this curiosity ; either his egotism forbade him to inquire what had brought Walter to Sicily, or, having some suspicion of the cause, he refrained from alluding to it. Concerning the circumstances of his capture, however, the merchant conversed readily enough. He was always, indeed, eager for talk—perhaps because it prevented him from indulging in melancholy reflections, or apprehensions which were more serious than he cared to own. The seizure of the *Sylphide* had happened almost as much by accident as design, or rather luck had befriended the brigands to an extraordinary degree. Had even the light wind held with which the yacht had sailed from Palermo, its owner would have escaped their hands ; but they had speculated upon the very thing that had taken place, and been successful. Unwilling to lose so great a prize as the person of the English milord, the hope of which had animated them for

weeks, they had followed the course of his vessel, which was of necessity along the coast and close in shore ; and, under cover of the night, embarking in a small fishing-boat, had boarded her in sufficient numbers to make resistance from unarmed men, taken unawares, without avail. The steersman, who was the only one on deck at the time of the seizure, had indeed tried to give the alarm, for which he had paid the penalty with his life's blood—the traces of which Walter and Francisco had discovered ; but the rest of the crew had been overpowered without a struggle, and, since it was by no means Corralli's policy to encumber himself with useless prisoners, had been set upon the road to Messina, from which far-away town no danger could be apprehended from the troops for many days. Lest any of these sailors should make their way back to Palermo, the road, as we have seen, had been strictly guarded, though that, of course, did not prevent Francisco's return to that city, upon whose report, no doubt, the soldiers had been sent out by the governor.

It was to the well-meant efforts of these emissaries of justice that the inconveniences of Mr Brown and Walter were now owing, and to which it seemed only too likely that their lives would in the end be sacrificed. It was positively certain that Corralli would never permit his prestige to suffer by allowing them to be rescued alive out of his power ; and, on the other hand, the cordon was drawn so strictly all around them, that it was most improbable that those in charge of the ransom would be able to break through, and reach their ever-shifting camp. It was not even certain—for they had had no news from the city since Lillian had been sent back—that the ransom was on its way. Poor Mr Brown had now become as eager to pay it as he had previously been disinclined to do so ; but the professional philosophy that caused him to regard it as a bad debt, had given way to more serious considerations. He had got to understand that it was very literally the price of his blood. Fatigue and privations had not only shaken his determination, but long experience of his lawless masters had somewhat opened his eyes to their true character, and to the perils of his own position. He perceived that his throat was likely to be cut at any moment before he could cry 'Police !' and that it would be of no use to cry it, even if he should have time ; but he did not understand yet that matters might take such a turn that he might be even glad to be put out of life by that summary process. Walter, however, from scraps of talk that he picked up from members of the band, was well aware that some terrible steps were in contemplation, in case the three hundred thousand ducats were not presently forthcoming. For one thing, both he and his companion had been carefully searched, and a penknife, which had been found upon Mr Brown, had been taken from him—in order, no doubt, to prevent his anticipating their cruel treatment, by putting an end to his own existence. The old merchant affected to attribute this to mere malevolence, and bewailed the loss of the little instrument, because of its business associations—he had had it, he said, for twenty years, and had never mended a pen with any other blade ; but it was doubtful whether he himself had not some inkling of the fate in preparation for him. As to Corralli, he maintained a gloomy reserve, never addressing himself to his captives, as heretofore, but

regarding them with a significant scowl, whenever his frowning eyes chanced to fall upon them. They were more strictly guarded, too, than ever, nor were they permitted, as before, to be together, but were located at opposite ends of the camp. It seemed to Walter that he had heard of some such arrangement being made with respect to animals which were destined for the butcher's knife. In their case, it was not the way to fatten them, for, deprived of his companion, the poor merchant began to lose health, and flesh, and spirits; nor did his appetite, which he had possessed at first in such vigour, remain to him. It must be confessed that there was not much to tempt it. The cordon drawn by the soldiers grew every day more strict, and made the task of provisioning the brigands very difficult to the wretched peasants who undertook it at the twofold risk of their lives. They were shot by the military, if detected in aiding or abetting the bandits; and they were certain to fall victims to the latter, when the troops should withdraw, in case they omitted to provide them with food. It sometimes happened that, for days together, no supplies could be brought up, and then some of the band would steal down the mountain, under cover of the night, and bring back what they could: hard cabbage and garlic plucked from some village garden, a piece of sour cheese, and as much black bread as they could carry. It was a feast-day when they came upon a herd of sheep and goats—when they got as much milk as they could drink, and ate the mutton almost raw—with such infinite precautions had the fire to be kindled for cooking it, and of such small dimensions was its flame. And all this time the captives had no change of linen, and only on very rare occasions were they permitted the use of water.

When they had been living for more than a fortnight under these wretched conditions, which, as Walter at least was well convinced, were not likely to be exchanged for better ones, an incident happened which for the moment filled all hearts with joy. A little after sunrise one morning, the brigand call was heard in the valley to westward—that is, in the direction of Palermo—and the whole camp was at once on the *qui vive*. Certain members of the band had been stationed in the neighbourhood of the city, to expedite the arrival of the ransom, and it was confidently expected that they had now arrived with their precious burden. Even Corrali's face expanded into a grim smile at the prospect of this happy result, and for the first time for days, he addressed a few words to Walter.

'It is very well both for you and for me,' said he, 'that I have been so long-suffering; but, to say the truth, my patience had almost reached the end of her tether.'

To Mr Brown he even now did not deign to speak, but regarded him with a grudging look, as a victim who had escaped his vengeance, and whom he regretted to see depart with a whole skin. As for the rest of the band, they had no such repinings; some evinced a childish delight by leaping and dancing, and others already began to gamble in anticipation of the gold that was presently to fill their pockets. In the meantime, Canelli had been sent down to see that all was right, and welcome the new-comers. Presently, he reappeared, making the signal of 'no danger,' but not that which had been agreed upon, to signify the arrival of the treasure. The captives were not aware of

the reason, but they saw that Corrali's face began to gloom, and a shadow had fallen on the general gaiety.

Following Canelli, were now seen two striplings, looking even younger than himself.

'They can surely never have intrusted so much money to boys like that,' observed Mr Brown, who had begun to feel uneasy.

'Alas!' said Walter, 'I fear there is no money.'

'Then Heaven help us,' sighed the merchant despairingly, 'for I believe that man will shed our blood.'

Walter did not answer; he had recognised Joanna and Lavocca in the two new-comers, and a gleam of hope shone into his heart. He felt confident that the former would help them if she could.

The two women came up the hill without raising their eyes from the ground, and Canelli, as he drew nigh, kept shaking his head. It was easy to see that they had brought neither ransom nor good news.

'What brings you here, Joanna,' inquired the brigand chief, in displeased tones, 'when I bade you stay in the cave until you heard from me?'

'A very ugly reason—the mere want of meat and drink, brother,' answered she, with an attempt at lightness in her tone. 'The villagers have brought us nothing for these three days, on account of the soldiers.'

Joanna's swarthy face was very pale, and her large eyes seemed to stand out from her sunken cheeks. Lavocca looked in even worse case, and when she had with difficulty reached the first tree that fringed their camp, she held on to it, as though her limbs needed support. It was evident that both of them were half-starved. Santoro was bounding forward to welcome his sweetheart, when the captain grasped his arm, and pushed him back. 'Look to your prisoner,' cried he gruffly; 'that is your first duty.—Corbara, let the women have food.'

It was an order by no means easy to execute, yet some morsels of coarse bread were handed to them, and a few drops of wine in a tin cup.

When they had refreshed themselves, Corrali began to make a speech, to which every one listened with the utmost interest. His words were uttered with such haste and passion, that Walter could with difficulty catch his meaning; but he seemed to be narrating the history of the band during the last few weeks. Whenever he alluded to his prisoners, his tone increased in bitterness, and he pointed rapidly from one to the other, and then in the direction of Palermo. The words 'starvation,' 'loss,' and 'death' recurred again and again, and then he drew attention to the wasted forms and pale faces of the women. It was plain that he was crediting the unhappy captives with all the misfortunes that had befallen them since the soldiers had been called out. 'And this ransom,' continued he, speaking more slowly, and casting an inquiring look around the band—'this ransom, that was to pay us for all our trouble, and which we thought had just come to hand, where is it? Have we heard even if it exists, or if the bankers are willing to pay it? No; we have heard nothing.'

'Nothing—nothing!' echoed the brigands gloomily.

'For all we know, this old man here may have been aware from the first that the money would not be sent; there may have been something wrong—purposely wrong—in his letter of authorisation; he may have trusted all along to the chapter of accidents, to the chances of escape, or of his being rescued by the troops; and, in the meantime, he may have been making fools of us.'

A menacing murmur broke out at this, and many a face was turned with fury in the direction of the unhappy merchant, who, pale, and trembling with apprehensions of he knew not what, looked eagerly at Walter, as though he had not been as powerless as himself.

'At all events,' resumed the chief, after a judicious pause, 'it is my opinion that it would be idle to wait this gentleman's pleasure any longer. As it is, we have borne with him far more patiently than is customary with us, and folks are beginning to say: "This Corrali and his men are not what they were; the presence of the soldiers alarms them; captives have only to be obstinate enough, and they will carry their point against these stupid brigands."'

'Stupid?' repeated Corbara, playing with his knife, and glaring from Walter to Mr Brown, as though debating with himself upon which to commence his operations. 'We will let them know that we are not stupid.'

'It has always hitherto been our rule, that when a ransom is not settled within a reasonable time, the captive should pay it in another fashion,' proceeded Corrali; 'and in this case, when we have been driven from our camping-ground, shot at by the troops, into whose hands two of our men have fallen, and by whom one has been slain, is it right that we should make an exception? Shall we ever see Manfred again, or Duano, think you?'

'Never!' cried the brigands gloomily; 'they are as good as dead.'

'We have the absence, therefore, of three friends to avenge; one life, as it were, to count against us in any case. These two should, therefore, not be permitted to die slowly.'

'You are right, captain,' said Corbara, drawing his hand across his mouth, which always watered at the prospect of a wickedness. 'But there is no reason why we should not set about the matter at once.'

The two brigands to whose custody Mr Brown was confided here each laid a hand upon his wrist, and Santoro and Colletta drew a pace nearer to Walter. It was evident that the long-delayed hour of revenge had come at last.

'I would wish to say a word or two, brother,' said a soft clear voice, 'before a deed is done of which we may all repent ourselves.'

'You may say what you please, Joanna,' observed Corrali coldly; 'these men, however, are not your prisoners, but ours.'

'The English girl was mine, until you sent me word that she was to be set free,' answered Joanna coldly; 'and since you have taken her, I claim him yonder'—and she pointed to Walter—'as my captive in her place.'

A shout of disapprobation burst from all sides at this audacious demand.

'It seems to me that the signora has fallen in love with our young Englishman,' laughed Corbara coarsely.

Joanna's eyes flashed fire, and her cheek lost all

its paleness for an instant, as the words met her ear; but she answered nothing, only looked with passionate appeal towards her brother, as though she would have said: 'It is your place to cut that fellow's tongue out.'

'Indeed, Joanna,' answered he coldly, 'such a proposal as yours seems to me to excuse a man's saying almost anything. These Englishmen are the common property of us all, and though it is true the signora was given to yourself, yet she was set free with a view to benefit you. You would have had a fair share of the ransom, had it been obtained, but it has not been obtained, and it is no fault of ours that the retaliation we intend to take for its non-arrival will not afford you gratification.'

'Gratification!' echoed she, contemptuously. 'When these men are dead—to-morrow, or the next day, or even the day after—will the recollection of your cruelties be worth to you three hundred thousand ducats? That the money has not arrived, is not their fault, but yours. If you had sent some responsible person to manage the affair, instead of a dying woman, you would have all been rich men by this time. Why, for all you know, she may never have reached the city alive, much more in a condition to settle matters with the bankers. Ask Santoro there, who helped to take her down to the village, whether she looked more dead or alive.'

'The signora was very weak and ill, no doubt,' said Santoro, upon whom a pleading look from Javocca had not been thrown away. 'It was my belief that she would not get over the journey.'

'And yet, you intrusted this important affair to such an envoy!' continued Joanna bitterly. 'One would think that three hundred thousand ducats was a sum as easily extracted as the ransom of a village mayor.'

'It is doubtless a large sum,' observed Corrali coldly; 'and since it has not been paid, the forfeit will be made proportionate.'

'Yes; but it would have been paid, had you gone the right way about it; and if you are not all mad, or thirsting for blood, like that brute Corbara yonder, you may have it yet.—Think, my friends, of what may be purchased for three hundred thousand ducats, and how much greater pleasure you will take in the spending of it than in what you now propose to do!'

'What you say is doubtless very true, Joanna,' replied Corrali in the same tone; 'but unless you have something else to propose to us than to have patience'—

'I have something else to propose,' interrupted she; 'I suggest that the error which you committed in sending a dying woman to negotiate so important an affair shall be repaired. Let another envoy be chosen, who will not let the grass grow under his feet. You talk of precedents, and surely this has often been done before. When a captive is taken with a servant, is it not our custom to send home the man to manage matters for his master's release? And though, it is true, this young Englishman here is no servant, he is of no more value to us in the way of ransom than if he were; while, on the other hand, he understands milord's affairs far better, being his friend.'

'It seems to me, captain, that there really is something in this,' observed Santoro, on whom the

masked battery of Lavocca's eyes had been playing incessantly during her mistress's speech.

'Something, yes,' laughed Corbara scornfully; 'and it is easy enough to see what it is, so far as the signora is concerned.'

Corralli looked carelessly about him, as though to invite others to express their opinions, if they were so pleased, and presently his eye fell on Canelli.

'Come, you are the youngest of us,' said he, 'and are not prejudiced in favour of brigand customs. How does it strike you, merely judging by common-sense, with respect to this proposition of my sister's?'

'Indeed, it seems to me,' returned the lad, with a glance of ill-favour towards Walter, 'that a bird in the hand is always worth two in the bush.'

'Or, rather, you should say, in this case, Canelli, that two birds in the hand are worth one in the bush,' observed the captain; a sally which evoked approbation, but no laughter, a sign that the brigands' humour was serious indeed. 'You see, my dear Joanna,' continued Corralli gravely, 'that the opinion of us all—or nearly all—is opposed to yours in the matter; and, for my part, I do not wonder at it. It is true that this gentleman'—here he pointed to Walter—'is poor; but we fixed his ransom at a certain insignificant sum—three thousand ducats, which has not been paid. His life, therefore, is forfeited, as much as milord's yonder. If we send him on this embassy, what guarantee should we have that we shall ever see him again? At present, we have his skin; but if he gets to Palermo, he will pay us neither in purse nor person.'

'That is clear as the sunshine,' observed Canelli approvingly: 'there will be but one prisoner left to us out of three, and not a single ducat.'

'That is so,' murmured a dozen voices. Even Santoro was obliged to acknowledge the merciless correctness of this arithmetic.

'You shall not lose the ducats,' answered Joanna steadily. 'In case the young man does not return on the appointed day, I will pay his ransom out of my own purse.'

'You must be mad, Joanna,' cried Corralli angrily.

On the contrary, it is you that are mad, Rocco, who will risk nothing, when there is a prospect of gaining so much. I see plainly that, by this plan, we shall gain all we have looked for, and I am not blinded by passion, like some of you.'

'By Heaven, I am not sure of that!' muttered Corralli between his teeth.

'At all events, my friends, you will have the three thousand ducats to do what you please with,' said Joanna; 'and if one of you should win it all at baccara, he will have a fortune.'

'I like that idea, I confess,' observed Colletta, who had great luck at cards; 'besides, we should still have milord yonder to amuse us;' and he pointed to the unhappy merchant, who, having long given up the attempt to understand what was going on, had sat himself down cross-legged, more melancholy than any tailor in a 'sweaters' shop.

'In order that there may be no doubt about the matter, my friends,' said Joanna, 'you shall have the three thousand ducats at once—Santoro, yonder, knows where they are kept, and shall go with any one of you to fetch them this very moment.'

Eloquence and logic are both very well in their

way, but the conviction they carry with them is slight, when compared with the persuasive power of ready-money. The captain, indeed, was displeased, not so much that Walter should escape him, as because he felt that Joanna had made a fool of herself, on account of the young fellow, and that the three thousand ducats would be a dead 'loss to the family;' and Corbara was furious, since the cruelties, for which he had as morbid an appetite as an American Indian, must necessarily be delayed. But, with these exceptions, the whole band were now in favour of Joanna's plan.

Walter had listened to these proceedings with intense interest, but even when the moment had apparently arrived for his being put to the most cruel tortures, he had scarcely been more moved than when he heard the generous proposal of his late hostess. While it was in debate, he had uttered not a syllable, nor even by a look expressed the gratitude with which it had inspired him, lest he should do it prejudice; but now that matters had declared themselves in his favour, he addressed the brigand chief as follows: 'I am fully aware, Captain Corralli, of the great kindness which your sister has shewn me, and of the generosity of the offer she has made; it is impossible for me to over-rate the confidence she has reposed in me; but you may be certain of this, that it is not misplaced. If I am alive, I shall return to you at any reasonable date you may please to fix, either with my ransom or without it.'

'And with your friend the milord's ransom,' put in the captain quickly. 'It is on that account—and not upon your own, remember—that we give you permission to depart.'

Joanna was about to speak, but Corralli stopped her angrily: 'You have got your way, woman, and be content with it. The arrangement of the rest of the affair remains in my hands.—To-day is Tuesday. You will understand, then, at this hour, at eight o'clock in the morning'—and the captain again indulged himself in consulting one of his splendid watches—'you will present yourself on this very spot on Friday.'

'The time is very short,' pleaded Walter, 'since there may be much to be done.'

'Then we will say eight o'clock in the evening, which will give you twelve hours more. At eight o'clock next Friday evening, then, we shall know whether an Englishman can be trusted to keep his word or not. After that hour, we shall begin to send you little mementoes of your fellow-countryman yonder; first his ears, next his fingers, and then, one by one, his larger limbs, till he becomes a torso. If the word of an Englishman should fail, that of a Sicilian will not; I mean it, by Santa Rosalia!' and the captain took a silver image of the local saint that hung about his neck, and kissed it fervently, as an honest witness does the Testament at the Old Bailey.

'O Walter, Walter, you are not going to leave me!' cried the old merchant wofully, perceiving that his friend was about to depart.

'I shall come back again, Mr Brown; I shall indeed.'

'No, no; you will never do that,' exclaimed the other despairingly; 'it is contrary to human nature.'

'I will, sir. So Heaven help me! as I am a Christian man, and a gentleman, I will return, either to set you free, or to die with you. There

is some hitch about the ransom, and I am going to Palermo to expedite matters. Don't fret, sir; all will be well yet, thanks to this generous lady.'

Poor Mr Brown's sagacity had by no means penetrated the disguises of Joanna and Lavocca; if he had done so, and had understood the nature of the obligation which the former had conferred upon him, he would doubtless have duly acknowledged it; as it was, he only looked wildly round in search of a female form. Walter, who had been permitted to cross the camp, to bid his friend farewell, explained to him, not without some embarrassment, how matters stood.

'But what has made the woman so civil to us?' inquired the merchant eagerly.

'She has a kind heart; it was she who sent the bread and mutton, when you were half-starved the other day.'

'But she has got pistols in her sash, and a long knife,' expostulated Mr Brown, 'and she wears'—

'Hush! yes; never mind. I must go now, for every minute is precious. Is it possible, think you, that anything should be added to the authorisation you sent by Lilian?'

'Nothing; it was quite in form. Still, I will write one line, if these wretches will give me pen and paper.'

Corralli produced the necessary implements, and the merchant wrote: 'Spare no expense, and trust implicitly the bearer; (signed) CHRISTOPHER BROWN.' 'Give my dear love to Lilian, and should I never see her again, nor you'—

'You will see me again this day week,' interrupted Walter hastily; he thought it base to take advantage of such an opportunity, though it was evident that the merchant had been about to couple his name with Lilian's. 'Good-bye, sir, for the present, and be of good courage.'

'Farewell, Walter, farewell; and God be with you!' answered the old man, with choking voice.

'Amen!' replied Walter solemnly.

Then the members of the band, with the exception of Corbara, who stood scowling apart, flocked round him to bid him good-bye; the same hands which had been itching to inflict death and torture upon him an hour ago, being now held forth to him with good-will, and even gaiety. Corralli alone was grave.

'You will not misunderstand your countryman's position here, because of all this,' said he, alluding to these manifestations of friendship.

'Neither his, nor my own,' answered Walter with dignity. 'I know there is no mercy to be expected for either of us, in case the ransom is not forthcoming.'

'And yet you will keep your word?'

'And yet I shall keep my word.'

The captain smiled incredulously as he held out his hand. 'Santoro here will be your guide to Palermo—and back again, if you ever do come back.'

Then Walter looked about him for Joanna, for whose ear he had reserved some heartfelt expressions of gratitude; but both she and Lavocca had disappeared. He was distressed at this, yet, at the same time, was conscious of a sense of intense relief. He felt that Corbara had been right in imputing to the chief's sister a personal affection for himself, which it was impossible he could reciprocate. In that supreme moment, all coxcombry

was out of the question, and matters were compelled to present themselves in their true light. Joanna loved him; and since he loved another, it almost seemed to him, though guiltless of deceit, that he had obtained the precious boon of freedom under false pretences.

## DEEP-SEA EXPLORATIONS.

### IN FOUR CHAPTERS.—CONCLUSION.

BEFORE leaving Christmas Harbour, a cairn was erected on the north-east point of the harbour, in which was deposited a detail of the proceedings of the ship, with advice and instructions to those who were soon to follow to observe the transit. On the last day of January the vessel left the harbour, and the following day started from the south point of the island, which was called Cape Challenger, for Heard Island. When midway between the two islands, a sounding was obtained in 150 fathoms; and twice, the following night, 100 fathoms were found, whilst at other times no bottom was found in 220 and 425 fathoms; shewing that a submarine connection existed between the islands, but of very irregular formation.

Light winds and thick fogs prevented the land being made until the morning of the 6th February, when Meyer's Rock and McDonald Island were seen. Both these are little other than rocks: the first rises 450 feet precipitously from the sea; the other is 630 feet high, and about  $1\frac{1}{2}$  mile long by half a mile broad. They lie about 25 miles west from Heard Island, which is the principal and largest of the group, being about 25 miles long and 7 miles broad. The mountains in the centre of Heard Island rise some 6000 feet above the level of the sea, and from their sides the glaciers descend to the water's edge; but unfortunately during the time the expedition was at the island, the clouds obscured the summits. The *Challenger* anchored in Corinthian Bay (or, as the sealers call it, 'Whisky Bay,' from the quantity of that spirit consumed there on the arrival each year of the store-ship) on the afternoon of the 6th. Here they found a party of sealers, most of them being Portuguese from the Cape Verde Islands. The principal men, however, were Americans. How the indolent Portuguese could be prevailed on to submit to banishment in such a climate, may be wondered at, but probably they had good reasons for leaving their country. The party were living in almost hermetically closed houses, sunk in the ground for warmth, as well as for protection from the prevailing violent gales. There are about forty men thus housed in various parts of the island, each party having a defined line of shore to watch for stranded sea-elephants. The life these men lead is both hard and monotonous: they engage for three years, and at the expiration of that period consider themselves fortunate if they return home with fifty pounds in their pockets. Even that proves no benefit to them, for after a few weeks of debauchery in the slums of New York, they are again penniless, and return to the ship before she has completed her refit, and in her come back to their wretched life of seal-hunting. But even seal-hunting on these far-away islands will soon come to a close. The indiscriminate butchery of the cubs as well as the grown seals will soon tell, as it has at Prince Edward Island and the Crozets; the seals will disappear, not from

being hunted, but by extermination. Would that some international law existed to restrain the savage brutality of these wasteful and cruel men, although it is easy to perceive how difficult it would be to enforce any law in such an out-of-the-way place as this!

It was the intention of Captain Nares to examine Heard Island, but a lowering barometer warned him off; so, as the bay is open, and it was dangerous to delay, he put to sea, only in the nick of time, as a furious gale burst on them. The sea rose tremendously, and, striking the vessel, forced in two of the ports on the main deck. But the gales in high latitudes are not of long duration, and this one was followed by a beautiful day, with a favourable breeze, which sped them on their way to the southward at the rate of nine or ten miles an hour.

On February 11th, in 60° 52' S. lat., and 80° 20' E. long., the bottom, at 1260 fathoms, was found to consist of diatom ooze. The first iceberg was met with on the same day and in the same latitude. Soon after, others were seen, and the ship's course was altered to pass near one. This brought all hands on deck to view the novel sight, and much was it enjoyed, for but few objects are more beautiful than one of these monsters of the polar regions. The rich cobalt blue of the caverns and fissures blending with the white of the ice, and the breaking waves dashing against it from the dark blue sea, are grand in the extreme; whilst the dazzling delicacy of the fringes of icicles glittering in the sun gives it the appearance of being fairy wrought. In passing, the chill from the ice is felt, and produces a feeling of such awe as causes one to hold his breath; and, to the meditative mind, the comparison will arise between the size of the mighty mass of ice and the ship that is passing with its hundreds of souls on board; from the ship it will descend to the unit self, and the proud man is humbled. Even the most careless cannot witness one of these mighty manifestations of the power of the Creator without a subdued feeling.

On the 12th, the voyagers reached the edge of the pack-ice, in latitude 65° 42', and dredged in 1675 fathoms. Here was another polar wonder, for, far as the eye could reach from the mast-head, there was one mass of pure ice. On the 16th, the Antarctic Circle was crossed in longitude 78° 22' E., the edge of the pack having been followed. On the 23d, they were within twenty miles of the position assigned by Lieutenant Wilkes of the American Antarctic Expedition to some mountainous land he called 'Termination Land'; but although the weather was clear, no land was to be seen. An iceberg was photographed, and the effect of firing at one was tried. A twelve-pound shot was first fired into one from a distance of about thirty yards; this brought down a great quantity of ice in slabs. Another shot, fired from a greater distance, buried itself in the ice without any apparent effect.

On the 24th, a heavy gale from the south-east was experienced, accompanied by the usual thick weather and heavy snow-squalls; this placed the ship in imminent danger, as she was surrounded by icebergs, and a distance of one hundred yards could not be seen in any direction. During the afternoon, in the thickest part of a squall, a large iceberg was suddenly seen on the lee-bow, on which the ship was drifting bodily. There was no

room to go ahead; the engines were reversed, and a part of the close-reefed maintopsail thrown aback. Fortunately, the ship gathered sternway, and just cleared it. After passing the iceberg, an endeavour was made to turn it to account by bringing the ship under its lee, to use it as a breakwater; but with full steam, and fore-and-aft sails, the gale was too strong to allow the ship to be brought head to wind, and there was therefore nothing to be done but to allow her to drift. In the evening, the weather slightly cleared, and while close to leeward of another berg, the ship was brought round on the opposite tack, and, as the distance between the two bergs was known to be clear, an anxious night was spent passing too and fro between them, steam enabling the ship to hold her ground. During this gale, the thermometer fell to 22°, and with the wind blowing so strong, it was piercingly cold.

With the following morning fair weather returned, and as the wind had blown from off the pack, the ice at its edge was open, and allowed the ship to push in to some distance, and to get within fifteen miles of Wilkes's Termination Land; but again, with a clear day, nothing was seen of it, and from this it was concluded that no land did exist in or near that position. In the afternoon, the ship stood to the northward, and with a fine south-west breeze the ice was soon left behind.

On the 26th, the day was spent in dredging in somewhat less than 2600 fathoms, the deepest water found since leaving the Cape of Good Hope. In the afternoon a gale sprung up with thick sleet, and another night of extreme anxiety was before them; but fortunately, just before dark, the voyagers fell in with an unusually large iceberg, and this time a friendly one, for by the help of steam the ship was enabled to maintain a position under its lee throughout the night.

The next morning with a strong favourable gale they bore up for Australia, in noways loath, after their short experience, to leave the icy seas. On the 3d March the tube brought up diatom ooze from a depth of 1950 fathoms. The registering thermometer shewed a temperature at the bottom of 31°. The last iceberg was seen on the following day in lat. 53° 17' S., long. 109° 23' E.

Those who visit the antarctic seas after having been in the arctic, are greatly disappointed in the form of the icebergs, for while those of the north assume every fantastic shape that fancy can conceive, the southern ones are nearly table-topped lumps of ice, precisely the same in form as on the day they parted from their parent glacier: these more resemble huge Twelfth cakes divested of their ornaments than anything else. In the warmer northern seas, icebergs melt more quickly, and assume far more picturesque appearances; but in the Southern Ocean the temperature of the water through which the icebergs drift is below the freezing-point of fresh water, and therefore insufficient in heat to melt the ice. It is only after they have moved a considerable way northwards that the regularity of their shape begins to be interfered with. As the berg travels from the pole, it first reaches a latitude where the summer sun has the power of heating the surface-water slightly above the freezing-point without affecting that immediately below it; this has the effect of melting a notch in the side of the berg all round it, at and just above the sea-level;

but this notch was not observed to extend into the ice in any case more than about thirty feet. As the warm water becomes still warmer as the berg floats farther north, it has naturally greater power, and deep caves or caverns are formed, which offer increased facilities for wave-washing the larger they become, until the mass being weakened, large pieces become detached. As this alters the centre of gravity, the berg lurches over, and either forms a slope, or a long spur or tongue rises; and thus the work of destruction proceeds, until the form of the berg is altogether changed, and that part which formed the tongue may become its topmost pinnacle. Hence the greater variety of form in the bergs seen by ships passing south on an arc of the great circle in comparatively low latitudes. The portions that break away from the berg are termed *calves*, and they are often of far greater danger to shipping than the bergs themselves, for the latter have a reflected light that renders them visible at a little distance on the darkest night; whereas, the calf, although it may be several hundred tons in weight, is not perceptible, or if so, may readily be mistaken for the top of a sea breaking.

The trawling after the sounding on the 26th March proved extremely interesting, and the same chocolate-coloured mud was found as at similar depths in the Atlantic.

On the 17th March the expedition reached Melbourne, having completed the voyage so far to the satisfaction of all, though not without sincere congratulations at being once more safe in port.

Five serial temperature observations were obtained in the southern ocean which indicated another feature in oceanic circulation, in that a cold stratum of water exists between two of a higher temperature. This cold stratum first made its appearance in latitude 52° S., and gradually decreased in temperature to the Antarctic Circle. It is probably caused by the fact, that as in the winter the ice and surface-water must necessarily be colder than the underlying water, and that during the short summer the surface-water is heated by the solar rays, which have not power to penetrate to any great depth; or the effect of the vast number of icebergs gradually thawing may tend to produce the cold stratum, as the fresh water thawed from the lower part of the berg at a temperature of 32° being lighter than the salt water, would rise towards the surface.

The *Challenger* did not make a long stay at Melbourne, but proceeded on the 1st April to Sydney to refit, which was much required after the buffeting she had experienced in the antarctic seas. Here the vessel was docked, rigging and sails overhauled and repaired, and all preparation made for continuing the voyage.

On the 12th June, the expedition left Sydney—after having been obliged to put back once—for Wellington, New Zealand, and commenced a sectional line of soundings immediately on quitting the Heads. Much importance was attached to this line of soundings by the inhabitants of New South Wales and New Zealand, in view of the project of connecting these two important colonies by telegraph cable. The deepest water found was 2900 fathoms, in 34° 50' to 36° 41' S. lat., and 155° 28' to 158° 29' E. long., and again the chocolate-coloured clay was found. In other soundings the bottom was generally found to consist of globi-

gerina ooze or gray ooze. The temperature of the bottom was 33° in the deepest sounding. In three instances, twice within three days, the line parted. Some stormy weather was experienced, and a very heavy sea. In Cook Strait, a man who was in the chains was washed overboard; he was not missed till some minutes after, when the ship was immediately hove to, but no traces of him could be seen; he must have gone down at once with the heavy sea that was running at the time.

A week was spent at Wellington, where the weather was very unfavourable. The taking in of coals and provisions was completed, and on the 6th July, the *Challenger* weighed her anchor. In consequence, however, of a dense fog accompanied with heavy rain, she was obliged to anchor in Waiheke Bay for the night, but proceeded the next morning. A good haul with the trawl was made on the 8th bringing up specimens of holothurians, shrimp worms, &c. On the 10th, in seven hundred fathoms several large fishes were brought up in the trawl and on the 12th, Macauley Island, of the Kermadec group, was seen. Soundings made on the 14th and 15th in 29° 55' to 28° 33' S. lat., and 178° 14' to 177° 50' W. long., at a depth of 520 to 630 fathoms found a rocky bottom, with a temperature of about 40°. On the 19th they reached Tongatabu, one of the Friendly Islands. This island is the finest of the group, and now the most civilised; it is very low, when compared with many of the Pacific islands, being almost flat, with the exception of few hillocks about forty feet high. Like most coral formations, it is crescent-shaped, having the convex side to the south, so that the harbour and town of Nukalofa is towards the north. The island abounds with cocoa-nuts, bananas, oranges, &c., but water is very scarce, and the little it has is not good. The climate is very trying, on account of the heat in the day (often reaching 90° in the shade), and the sudden change to cold at night together with heavy dew. The soil is rich, but the inhabitants are too lazy to cultivate it.

No sooner was the *Challenger* at anchor than she was surrounded by canoes, and the natives speedily found their way on board; they are a fine, handsome race of men, with intellectual features. The king, George Tabou, was called upon; he is now seventy years of age, and is reputed to have been a great warrior in his youth. He and his subjects have embraced Christianity, but of rather different denominations, there being both Catholic and a Wesleyan missionary on the island. The church, which is situated on the highest hillock, and is the most conspicuous building on the island, was visited at a time when one of the natives was preaching; it is capable of containing a congregation of seven to eight hundred, and is substantially built: the singing was creditable, and the time good. Schools also have been established, and the power of the missionary is almost co-equal with that of the king. The dress of the natives is the usual *tapa*, wrapped round the loins, but some of them have adopted the European dress, and are not a little proud of the distinction. The men are only permitted to visit a ship on condition of wearing a shirt, and the women not at all.

On the 22d, Tongatabu was left; and three days after the expedition reached Kandavu, and anchored in Ngaloa harbour.

From the Fiji Islands the *Challenger* proceeded through the New Hebrides group to Torres Strait

and visited Somerset, Cape York; and then passing through the Banda Sea and the Molucca Passage, touching at Dobbo, Ki Doulan, and Banda Islands, arrived at Manila on the 4th November, and after a short stay, proceeded to Hong-kong, at which port she arrived on the 19th November; and here for the present our narrative ends.

#### INCIDENT IN THE FRENCH REVOLUTION.

JEANNE ARNAUD sat at the close of day under the great old chestnut tree before her own door. She was a very handsome Norman peasant, of about twenty-four years of age, with well-cut features, and fine eyes. Her costume became her well; and in material was so fine that it, as well as her surroundings, testified to the well-being of the family of which she was the house-mother. At her feet, playing with a lapful of daisies, sat a lovely boy of about two years old, a very fair, golden-haired child, richly dressed in cambric and lace, with a blue sash and coral. They made an idyllic picture of domestic happiness, set in a background of rural beauty. The cottage behind them—in the walls of which black and white timbers formed a framework for the yellow clay—was covered with a vine and a climbing rose-tree laden with white roses, which scented the air with their perfume. There was a garden of vegetables and flowers on one side of the dwelling, in which hives stood under the shelter of the eaves; on the other side, a little rivulet sped gaily along, with a pleasant ripple and murmur.

From where she sat, Jeanne looked down on the village, and could see the red glittering of the sunset on the cross which surmounted the little church, and the blue smoke curling up from the cottage chimneys. Over all, the glory of sunset was falling; and on the languid breeze, heavy with perfume, came the afar-off sound of sheep-bells, and the lowing of kine. In the branches of the trees a blackbird at times chanted a portion of his evening hymn. Was there ever a scene or hour which spoke more emphatically of peace? Yet it was far from the breast of the young woman knitting beneath the walnut tree; Jeanne Arnaud was at that moment the victim to a strong temptation.

She had been chosen as nurse to the infant heir of her seigneur, and, in consideration for such service, had been installed in the best cottage on the estate, with permission to keep a cow and poultry in the neighbouring fields. Her husband, also, was constantly found in work, and excused from the labour on the roads, which was at that period the especial grievance of the French peasant; for the period to which our story relates is 1770, a time when the sufferings of the poor in France had perhaps reached their climax. But all this prosperity—constant and paid work, good food, and pleasant home—depended on the little life of the babe which Jeanne Arnaud nursed for the beautiful young countess, who, though complying with the fashion of her day, in sending her infant to be nurtured in a peasant's home, had still cared (very exceptionally!) for the comfort of the family in which it was to be reared. One hard condition she had indeed made: she would have no foster-brother for her son; Jeanne must nurse the little count only; and her own

child must be sent out of the village. It was a hard trial for a young woman who adored her first-born babe; but the Arnauuds were poor, and the sacrifice was made. However, Jeanne obtained permission to visit her infant, at her mother's house, for a short time every year.

Madame Gregoire, Jeanne's mother, lived nearly thirty miles away from Mirville. Her house was on a lonely common, some miles—four or five—from a town. Of this fact Madame de Mirville was of course ignorant, or she would never have suffered her child to be so far from medical aid during his teething.

At the end of the first year, Madame Arnaud took this permitted holiday, and arrived rather late one evening at her old home. That same night, the little count was seized with croup, having probably taken cold on his journey. There was no doctor at hand, nor any means of sending for one, for the woman who nursed Jeanne's baby had been summoned away to her mother's death-bed, and Jeanne was too terrified to consent to be left alone with the child while her mother went. The old woman, an experienced nurse, did all she could; but neither honey nor the hot bath availed, and the babe expired in Jeanne's arms. In the gray dawn, Madame Arnaud and her mother stood gazing with blank faces of dismay and consternation on the little dead heir.

'*Hélas!*' moaned Jeanne, 'and we have had no doctor. Madame la Comtesse will *never, never* forgive me. She will not believe that the infant could not have been saved. She will say: "How dared you go so far away from the doctors?" We are ruined; we are lost!'

The grandmother stood silent, looking down moodily on the bed where the little corpse lay. At that moment, Jeanne's own babe was heard crying lustily in the next chamber. The old woman went to it, and returned with it in her arms. 'Here is thy safety,' she said, in a hoarse whisper. 'The babes are both fair, with golden hair and brown eyes, and alike, as all babies are. Happily, no one here has seen the little count. We will bury the dead child as thy son, and thou shalt give the countess thy own child. Such a gift may well atone for the loss of her own babe.'

To this proposal, Jeanne strongly objected. The trick would be a crime, which shocked her sense of honour. The apprehensions of being punished for alleged negligence, and which the mother persistently plied, at length shook the young woman's integrity. It was agreed that the nearest doctor should be invited to inoculate the living child as being that of the countess.

Madame Gregoire set out early for the town, and returned with the doctor, who looked at the tiny corpse, and inoculated the living baby, took his fee, and promised to return the next day. He was quite ready to write and inform the countess that her son was his patient, that inoculation was necessary, &c. So Jeanne obtained an extra month's holiday, to nurse the babe through his illness; and the poor little heir of Mirville was consigned to a peasant's grave in the nearest churchyard.

When she returned home, Jeanne was able to ascribe every change in her nursing to inoculation and change of air, and no suspicion was excited; for Jeanne, to make more certain of not incurring it, had represented the death of her own child as having occurred the day before her arrival at her

mother's. Up to the present moment she had been successful in her project; but now her heart failed her. The count and countess were to arrive that day at the château, and she expected to be sent for—perhaps the next day, as it was now late—to the house to exhibit her nursing to its parents. Would the countess detect the fraud? She might, for a mother's eyes are keen; but then, again, she was very young, very thoughtless, and had not seen her child since he was four months old.

Whilst Jeanne revolved these possibilities in her mind, the shrill bark of a dog attracted her attention, and looking in the direction whence it came, she beheld a lady leading a lap-dog by a blue ribbon, advancing towards her. Jeanne instantly rose, for she recognised the countess. The lady was dressed in the extreme of that fashion with which the pictures of Marie Antoinette have made us familiar; she was very beautiful, and had a sweet innocent expression of countenance.

'Well, *ma bonne*,' she said, in a very pleasant voice, as she reached the spot where Jeanne stood, 'how is my darling babe?'

With a profound courtesy, Jeanne, for all reply, raised and held out the boy in her arms.

'What! this infant mine? What a splendid child he has grown! Do give him to me. Yet stay; I might let him fall. I will sit down, and then you shall put him on my lap.' And the young countess, seating herself on Jeanne's chair, took the babe in her arms, and gazed earnestly and tenderly on him, while the nurse stood by in breathless fear and suspense.

'He is splendid!' cried the young mother, with a sigh of rapture. 'I could not have believed he would have improved so much. My faithful Madame Arnaud, you merit my best thanks for your care of him.' And she extended her hand.

Jeanne took it, courtesying humbly, and murmuring: 'Madame is too good.'

'Can he talk?' asked the countess, kissing the baby hand she held.

'Yes, Madame; he begins to talk.—Monsieur, speak to the beautiful lady.'

The babe looked up in the lovely face of the countess, and murmured: 'Je vous aime, Madame.'

'Oh, you beloved little one,' cried the lady; 'I shall adore you!—Do you know, Madame Arnaud, I am going to be a true mother to him? I never mean him to be away from me any more.'

'Madame!' cried the peasant in a shrill tone of dismay.

'Ah, you fear you will have to part with him! No, *ma bonne*; I will not so reward your faithful care. You shall go with him, and live at the château or at Paris (as it may be) with him.'

Jeanne breathed more freely; not yet was she to lose her boy entirely.

'Madame is too good,' she said humbly; 'it would break my heart to part from my nursing.'

'No need—no need; I shall want you still; though I have learned a mother's duty and a mother's happiness from Jean Jacques Rousseau. But there; you do not understand. Yes; you will come with us, and we will make your husband a recompense for sparing you to us.'

It was clear to Jeanne that André's happiness would not for a moment be taken into consideration by Madame, when her own convenience was to be studied, yet she felt sure that the young lady meant no unkindness, that it was only the

thoughtlessness for others, which was nearly universal then amongst the *aristocrates*. Jeanne would be sorry to part from her husband; but since her child had been restored to her, she had grown to love it with a perfect idolatry. It would, as she said, have broken her heart to part from the babe.

And thus it was settled. André murmured a little, naturally, but never thought of disputing his seigneur's will; and when the young countess returned to Paris, she carried with her the infant and his nurse.

While the child continued a mere infant, the nurse-mother was not unhappy, though she regretted the separation from her husband, and would at any moment have gladly returned to the old home life in the village, for which she often yearned; but as the boy grew older, the bitterness of the deception began to be felt by her.

The countess had a second son—as small and delicate as the first babe had been—and she loved it dearly, for she nursed it herself; but she was not proud of it, as she was of the noble-looking son of the peasant. She was devoted to her (supposed) first-born, who repaid her petting with a wonderful affection, considering his age; and Jeanne began to nourish a bitter jealousy of her lady, who had completely rivalled her in her son's heart; for, though fond of his nurse, he, of course, regarded her simply as an old servant; but he looked up to the countess with chivalrous admiration as well as filial love. He was also very fond of the little delicate brother, four years younger than himself, and resented with angry and haughty words the preference which Nurse Arnaud shewed to himself, when it became injustice to his brother; for Jeanne continued head of the Mirville nursery, with a staff of subordinates, for more than ten years. When the little boys were placed finally under the care of a preceptor, Madame Arnaud received permission to return to her home, her services being liberally rewarded by a pension. She would fain have remained in the family, to be near her son, for gradually she had been weaned from the husband whom she had seen only occasionally; and her almost insane love for her child made her unwilling to be separated entirely from him; but the boy did not support her request to stay, and the countess thought it best that she should go. So Madame Arnaud returned to her home again, childless and embittered.

Her husband had grown morose since his home had been broken up, and was full of the troubled thoughts and wild desires which then stirred France to its depths. Jeanne, hating the countess with an unreasoning jealousy, was quite ready to share his hatred of the aristocrats. A wild dream haunted her then: if only 'the people' gained their 'rights,' all would be equal, and then she might reclaim her son, confess her deceit, and exult in the pain and sorrow of the countess, who had, she often murmured, 'spoiled her life.'

Her earnest desire was to get to Paris; there, at least, she should occasionally see her boy; but André would not hear of such a change. He was a countryman, and he hated the idea of being shut up in a dismal street; so Jeanne had to wait, and only caught an occasional glimpse of her son when the family came to the château, which at last they nearly ceased to do, on account of the troubled state of affairs in the capital.

At last, long after her dismissal from the Mirville

Hôtel, Madame Arnaud became a widow. Her grief for her husband's death was swallowed up in the thought that *now* she was free to live where she pleased. She arranged their little affairs, found that—thanks to the thrift of her husband and herself—she was not left badly off, sent to bid her mother—now an aged woman—join her, and, thus accompanied, proceeded to Paris, and established herself in a small apartment in the *quartier* St-Antoine. The Revolution was by this time growing into the monstrous thing it finally became, and the old woman Greigoire—a worthy specimen of those evil times—took a furious part in it.

For a time, Jeanne was absorbed in her wild efforts to see and speak to her boy. The idea of winning his love, or even of being near him, became a perfect monomania with her; but it was very rarely that she could get a smile or word from her nursing, while all Paris spoke of his love and devotion to his supposed mother. Irritated and embittered by the consequences of her own crime, she at last divided her attention between the task of haunting the footsteps of the Count de Mirville and attending the revolutionary clubs; and, still full of her dream of finally reclaiming her son, associated herself with the unfeminine violence of the Parisian women. Unseen by her, the Count de Mirville once recognised his old nurse in a procession of these furies, and from that day would notice her no more. In vain Jeanne called at the Hôtel de Mirville; the *conciierge* informed her that she would never again be admitted, by order of Madame la Comtesse.

Infuriated, maddened, Jeanne Arnaud at once denounced the De Mirvilles to the Convention—'they were about to emigrate; they were in a plot to release the king.' The family was at once arrested; and the mother and brothers found themselves consigned to the prison of La Force. It was nearly the end of August 1792. On the 2d of September began that awful massacre which stained with inexpiable blood the infancy of the French Republic. With inexpressible horror, Madame Arnaud perceived the consequences of her revenge; but she did not despair of her son's safety. She had great influence with the mob; she had often before led them to crime—she would use them now as her André's deliverers. Armed with a pike, she harangued a group of women and men, and told her story. She was heard with singular sympathy by her bloodthirsty audience. 'Her son, of whom she had been so cruelly robbed by those vile aristocrats,' should be restored to her. They rushed into the prison; they forced their way to the cell in which the countess and her sons were confined; they bade the Count de Mirville come forth, for he was one of themselves—the son of André and Jeanne Arnaud, worthy peasants. The people would protect their own children.

The young count listened bewildered. He beheld his nurse; he believed that it was a plot of hers to save him, so he did not deny the statement; he simply refused to leave the prison unless the countess and her son went with him. There was a brief pause. Jeanne knew well that there was not a moment to be lost, by the awful sounds without the prison. She urged compliance with his entreaty; 'the fate of his friends, the aristocrats, would be but deferred,' she pleaded. The bandits obeyed her; and the ferocious troupe, already bloodstained, and carrying heads on their

pikes, escorted the trembling countess and her sons to Madame Arnaud's lodging in St-Antoine, through scenes of unrivalled horror. We need not dwell on the crimes of that 2d of September night; we have only to do with the story of one unhappy woman.

The next day, when the released and preserved prisoners would have thanked Jeanne for her happy *résue*, they were astonished to hear that she had but spoken the truth—a truth readily confirmed by the testimony of Jeanne's mother. At first, the countess was obstinate in refusing belief to the tale; but no reproaches or threats could shake the testimony of the two women. 'How dared you—how dared you,' at length cried the agonised lady—'how dared you thus impose upon your seigneur?'

'*Hé!*' cried Jeanne, 'and why should I care for my seigneur, when by his and your orders, Madame, I was forced to abandon my own babe—to send it from my home? Had you left my boy in my house, deception would have been impossible, for the neighbours would have known too well which was my babe, and which yours.'

The countess groaned aloud; and yet, when the truth was known, she marvelled in her secret heart that she had not suspected it long ago. Louis was so unlike the family on which he had been grafted. A large, strong man, with great intellect, careless of dress and gaiety, devoted to philosophical research. Moreover, he bore a distinct resemblance to the old woman who claimed him as her grandson. Pierre, the count's real son, was, like his father, a little man, with small elegant features and hands and feet; a *petit-maitre*, who shrank from wetting his feet, and was in all things a representative of his order at that period. Doubt slowly vanished from the countess's mind as she gazed on the supposed brothers. But she still loved Louis—or rather André Arnaud—on whose filial affection she had so long rested.

André himself felt stunned and bewildered; but one thing was clear to him: his supposed mother and brother were in great peril; he read their danger in the baleful countenance of his grayd-mother. To save them was his first thought. He spoke plainly and sternly to Jeanne: he would never, he told her, acknowledge her as his mother till the countess and her son were saved. If they died, he would die also.

Madame Arnaud, convinced that he meant what he said, used her inborn cunning and her influence with her neighbours to comply with his conditions. She procured disguises and a conveyance; and the mother and son were conducted by André to the gates of Paris in a green-grocer's cart. Thus far only would Madame Arnaud permit him to accompany them. They parted with tears and affectionate farewells, and André saw them pass the gates in safety. Then, a sad and broken man, he returned to his mother's home.

The days and months went on. Madame Arnaud devoted herself to her son, and sought by all possible means to win his affection; but he shrank from her with a repulsion it was impossible for him to disguise.

Jeanne was heart-stricken; she had given up mixing in the events which occupied her *quartier*, since he had been with her, for was he not at heart an aristocrat? But now murmurs of her disloyalty to the people, of her hankering after

aristocrats, met her ear; and Madame Arnaud knew well how fatal suspicion would be both to her and to her son. It was for his sake more than for her own that she sought to prove herself unchanged, and took her knitting to the side of those furies who sat by the guillotine, and watched the daily fall of heads; impressing on her son the need of his abiding in the home she had given him, lest some word or look should betray him to the populace.

One day, weary of the long dismal seclusion, André, after he had watched both his mother and grandmother leave the house, went out himself, and, as fate would have it, wandering listlessly along—unmarked in his peasant garb—found himself close to the guillotine. A row of tumbrils charged with victims stood beneath it, surrounded by a dense crowd.

The tumbrils gave up their loads in turn; the doomed men and women walking to the steps of the guillotine in single file. As André watched them with an aching heart, he suddenly started, and with difficulty repressed a cry. Amongst them, moving with a brave careless grace, he beheld Pierre, Count de Mirville—his sometime brother, who accidentally brushed against André without seeing him. The next moment he was whirled by a strong hand into the midst of the mob, and another walked in his place. Gazing round in bewildered amazement, Pierre found himself free. There was no time to ask who had saved him—not a moment must be lost; he dashed down a side street, and escaped.

Madame Arnaud talked quietly with the *tricoteuses* beside her of the number of heads already fallen.

'Have you heard the news?' said her neighbours. 'The aristocrats with whom you lived so long ago have been taken and are condemned. I was present at the trial—they are in prison now.'

'What! the ci-devant Countess de Mirville?' exclaimed Madame Arnaud.

'Yes; she and her son were discovered in hiding a few miles from Paris—though well disguised—and they will suffer—it may be to-day.'

Madame Arnaud turned pale. What would André say or think? No matter; it was not her fault that they had not succeeded in getting out of France. He could not blame her for it. But she watched in ill-repressed anxiety the prisoners as they reached the guillotine. No face she knew was amongst those pale set countenances! With a sigh of relief her eyes fell again on her work. Suddenly her neighbour nudged her, and exclaimed: 'Here is one of them—the count.'

Jeanne started, gazed breathlessly at a head as it was laid under the fatal steel, then shrieked wildly and loudly, in a voice of agony which none could ever forget: 'My son, my son!' Ere the cry died away, that head rolled into the basket.

'It was the eldest son—the one she nursed so long,' said the woman next her: 'her feelings are natural.'

'Nay, she is an aristocrat at heart,' denounced the fury by her side.

But Jeanne heeded not her denunciation or the other's pity; her reason fled from the hour she beheld her boy die for his supposed brother.

One of the mob amongst whom André had been standing had recognised both him and the count, and pursued the fleeing prisoner, not to re-take him,

as those around supposed, but to lead him to a place of safety. This man had formerly been a groom of the Count de Mirville's. 'It was Monsieur le Comte who saved you, Monsieur,' he said, when they were in shelter. 'He took your place, and is gone to the guillotine in your stead.'

Pierre listened in amazement; then, bursting into tears, he exclaimed: 'I might have guessed it—I might have known! O Louis! O my brother!'

Madame de Mirville remained forgotten for a time in prison, and was finally saved by the death of Robespierre and the end of the Reign of Terror. When she and her son were reunited, she heard from his lips of the self-sacrifice of André Arnaud, and from that moment refused to believe he was not her son.

'It was a falsehood of that wicked woman,' she exclaimed. 'No peasant would have died so nobly. He was my own son—my noble, gallant boy!'

And as a son and brother they mourned for him, inscribing on the monument reared to the memory of the De Mirvilles, the name of Louis, Count de Mirville. Thus, even in death, Madame Arnaud did not regain her boy.

The miserable woman died in a madhouse at Paris—as so many others of the furies of the Revolution did—continually haunted by the memory of that beloved head falling on the scaffold. Insanity did not release her from that awful memory, the Nemesis which followed her sin, till Death, the consoler, set her free.

### CIRCUS LIFE.

It is not a little strange that equestrian performances, such as we now understand by the term, are but little more than a century old in England. It is true that manuscripts of the thirteenth and fourteenth centuries give us representations of the feats of clever horses, such as gamboling on their hind-legs to the sound of pipe and labour, or dancing on the tight-rope, while Banks's 'dancing horse' has obtained an immortality through Shakspeare's mention of it in *Love's Labour's Lost*. In Queen Anne's reign, a horse was exhibited on Tower Hill which could fetch and carry and execute other curious tricks; and a French author records 'a grand ballet-dance upon managed horses,' executed before Louis XIII. at a court festival. It is not, however, before the latter half of the eighteenth century that we find the circus proper. In 1767, equestrian performances were given in a tea-garden at Islington; and about the same time, one Philip Astley formed a ring with rope and stakes in a field in Lambeth, from which he moved to the site of the amphitheatre near Westminster Bridge, establishing there a rude circus, only partially covered in. Astley, unlike most of his successors, who, Mr Frost\* tells us, have lived from their infancy in the odour of the stables and the sawdust, had learned some feats of horsemanship while serving in the army, where he had distinguished himself by the capture of a standard at the battle of Emsdorff. On obtaining his discharge, he was presented by his general with a horse, with which, together with a purchase of his own, he commenced

\* *Circus Life and Circus Celebrities*. By Thomas Frost. London: Tinsley Brothers.

a form of amusement, which, to a very late date, was almost exclusively associated with his name. He died in 1814, with the reputation of being the best horse-breaker and trainer of his time. He bought all his horses in Smithfield for five pounds apiece, without regard to their colour or symmetry, provided that they appeared docile.

Mr Frost gives some amusing specimens of early play-bills, which are remarkable for their bad grammar and personal allusions to rival establishments. Thus, the proprietor of the Royal Circus, opened in 1783 in Blackfriars Road, after thanking his patrons for their support, 'acquaints them his antagonist has caught a bad cold so near to Westminster Bridge, and for his recovery is gone to a warmer climate, which is Bath in Somersetshire. He boasts, poor fellow, no more of activity, and is now turned conjuror.' In another bill of the same establishment, 'Hughes has the honour to inform the nobility, &c. that he has no intention of setting out every day to France for three following seasons, his ambition being fully satisfied by the applause he has received from foreign gentlemen who come over the sea to see him.' The same Hughes 'rides at full speed with his right foot on the saddle, and his left toe in his mouth, two surprising feet.' A newspaper of this period (1788) reads strangely as it remarks of Sadlers' Wells Theatre, that it is the only place of amusement at which 'a man may if he chooses get drunk. A pint of liquor is included in the price of admittance, but as much more may be had as any person chooses to call for. . . . This is not permitted at Astley's, the Circus, or the Royalty.' Other circuses were subsequently established on the sites of the present Olympic and Prince of Wales' Theatres, Astley's meantime having attained a notoriety among all classes. The fashionable Horace Walpole pays it a visit in September, a time when he declared London to be 'as nauseous a drug as any in an apothecary's shop,' and is highly delighted; and Johnson, talking of Whitefield, says: 'Were Astley to preach a sermon standing on his head, or on a horse's back, he would collect a multitude to hear him; but no wise man would say he had made a better sermon for that.' At the beginning of the present century, circuses began to travel. They were on a very limited scale, their stud consisting of only three or four horses, nor did they always boast even of a tent. One of these circuses (Bannister's), when located in Edinburgh, obtained the services of David Roberts, the future Royal Academician, who, at a salary of twenty-five shillings a week, was engaged to travel with the circus as its scene-painter. We may contrast with these early shows the monster tenting circuses of America, such as Barnum's World's Fair, with which he took the field in 1873. The transport of this establishment, which comprised a thousand men, five hundred horses, and fifteen hundred wild beasts and rare birds, required one hundred and fifty railway cars. Its daily expenses were five thousand dollars; the tent, which contained three distinct rings for three performances to be given at the same time, could accommodate fourteen thousand spectators. The great street procession, which paraded the town every morning, was three miles long, and, if we may believe Mr Barnum, worth going a hundred miles to see. The museum department, besides its one hundred thousand curiosities, included a national portrait-gallery, and a

collection of classic statuary. Tickets for the show could be issued by the 'lightning ticket-seller' at the rate of six thousand per hour. In America, great trouble is experienced by circus managers from the attempts of crowds of roughs to break into the tent. If they are refused free admittance, they either cut the guy-ropes, or get up a fight with the circus performers. These mammoth establishments carry about the means of camping and living, so as to be independent of hotels and lodging-houses. They are accompanied generally by what are called 'side-shows,' which are entertainments given in a small tent immediately adjoining the big show, under independent management, large bonuses being given by their proprietors for the privilege of accompanying the main circus. The side-shows consist of the exhibition of such monstrosities as animals with a superabundance of limbs, living skeletons, Daniel Lamberts, or pig-faced ladies; or of a minstrel performance, which immediately follows the principal entertainment.

In our own country, the larger equestrian establishments, such as Sanger's or Hengler's, travel only in the summer season. Many of the principal members of such a company have their own 'living carriage,' and, we are assured, lead a healthy, jolly life. Sanger's circus comprises some two hundred persons, upwards of two hundred horses, and no less than eleven elephants. The Messrs Sanger are the present proprietors of old Astley's Amphitheatre, which, a few years ago, an enterprising London manager turned into the Royal Westminster Theatre. But the undertaking did not prosper; a circus it had always been, and to its old uses has it now returned, to the joy of Lambeth, and with the good wishes of all London.

Circus men are, generally speaking, a light-hearted set, save the clowns, who are grave and taciturn out of the ring; they are said to marry young as a rule, are long-lived, and seem never to become superannuated. Moreover, fatal accidents are rarely known, even among those who run the greatest risks in the profession, and such men as the lion-tamers Van Amburgh, Crockett, and Macomo, have died quietly in their beds. Strict sobriety, it need not be said, is essential to their safety; and of Macomo, a famous African lion-tamer, we read that coffee was his only strong drink. The violent deaths of such performers may be always traced to their insobriety or want of temper. Thus, Macarthy, who was torn to pieces while performing, was addicted to drinking; and Helen Blight, a 'lion-queen,' owed her death to her striking a tiger with a whip.

The earliest travelling menageries were those of Wombwell and Atkins, which were formed at the beginning of this century. Of Wombwell we read, that one year, on the occasion of Bartlemy Fair, he travelled to London so quickly from the north, that his one elephant died on the journey. Atkins, a rival showman, forthwith placarded his canvas with the announcement that he had 'the only live elephant in the fair;' whereupon Wombwell, not to be outdone, posted his menagerie with the words, 'The only dead elephant in the fair.' Live elephants had been seen, but no man had seen a dead one, and consequently, Wombwell's show was crowded, his rival's deserted. Wombwell had a lion-tamer on his establishment before Van Amburgh appeared, but the latter is generally credited with the honour

of having introduced the art of lion-taming into England. The Duke of Wellington once asked him if he was ever afraid. Van Amburgh replied: 'The first time that I am afraid, your Grace, or that I fancy my pupils are no longer afraid of me, I shall retire from the wild-beast line.' An old pamphlet which we have met with tells us that her present Majesty was so pleased with Van Amburgh's performance, that she visited Drury Lane Theatre six times within so many weeks, and that on one occasion she gave the animals a close inspection, when they had been purposely rendered ferocious by a fast of thirty-six hours. From the same authority, writing of Van Amburgh's visit to Edinburgh, we learn that the den containing the wild beasts occupied the whole breadth of the stage in the theatre; the strength of the company consisting of two lions and a lioness, a couple of tigers, and half-a-dozen leopards. The leopards would spring upon their master's shoulders, or, spreading themselves on the ground, form pillows for his head. Now he would box with them, growling, snarling, and snapping at him with their fangs; now he would knock their heads together and cuff them, when, if they shewed the slightest signs of displeasure, a hint from their master would bring them grovelling and prostrate at his feet. He would distend the jaws of a lion while it roared, and by shutting and opening them rapidly, break the roar into a succession of sounds that mingled the ludicrous with the horrible. When the lioness snapped and struck at him, he coolly put his face down to her head, and gazing into her eyes until she shrunk back ashamed, brought down the house with applause. One of Van Amburgh's feats was to put his head inside a lion's mouth. This apparently foolhardy act was attended, it should seem, with but slight danger, for, by taking hold of the nostril with one hand, and the lower jaw with the other hand, the performer is master of the situation, *provided always* that the beast does not playfully stick its talons into the man, who, in such a case, stands fast for his life till he has shifted the paw. The fame of this king of lion-tamers, who, as we have seen, came to a peaceful end, has been perpetuated by Landseer's well-known picture, now in Apsley House. Most of the performing lions have been bred in cages, and commence their instruction at a tender age; kindness and fearlessness on the part of their masters being the chief means employed to bring them to subjection. One performing lion in Sanger's circus was so tame that it used to lie at the feet of Mrs Sanger in her impersonation of Britannia, when the cavalcade paraded the towns which the circus visited; and another belonging to the same company is suffered to roam about the house like a cat. Leopards and hyenas are other animals amenable to instruction, and a wolf has been seen in a cage lying down with a lamb.

The female members of the large family of performers, of which we are treating, have naturally always formed an attractive feature in managers' play-bills. One of the most famous of these was Adah Menken, an American of Jewish extraction, who wrote poetry, and translated the *Iliad* when she was in her early teens, and was proficient in the Hebrew, Greek, Latin, Spanish, and German languages. Coming to this country with a high reputation as an actress, she created some

sensation at Astley's by appearing as Mazeppa, strapped on a wild horse. During her stay in England she brought out a volume of poems, dedicated, 'by permission,' to Dickens. She had been married to Heenan the pugilist for some years previously to her death, which occurred in Paris, not many years after her first appearance in London. Lulu was another lady who had commenced public life at the Alhambra as a boy on the trapeze, her sex being unknown even to her fellow-performers. She was subsequently famed for her execution of the triple somersault, and a vertical spring of twenty-five feet from the ring-fence. Another female name is that of Mademoiselle Ella, whose grace and beauty formed a theme of admiration, but which must have proved a source of equal disappointment, when it turned out that the lovely Ella was a man! We will conclude this notice of an interesting little book with the quotation which its author aptly repeats out of the mouth of the immortal Sclary: 'People mutht be amuthed. They can't be alwayth a-learning, nor they can't be alwayth a-working; they an't made for it. You *mutht* have uth. Do the withe thing and the kind thing too, and make the betht of uth, not the wuth.'

#### THE GRAVE'S VOICES.

TRANSLATED FROM THE GERMAN, BY ANTONIA DICKSON.

SUNK as in dreams, and lost in anxious thought  
My footsteps brought me to this lonely spot.  
To whom belongs the field? this flowery bed?  
    'The dead.'

Enter thou in, my soul; why shouldst thou fear?  
Nought but sweet buds and flowers are blooming here.  
Whence comes the essence for these sweet perfumes?  
    'From tombs.'

See here, O man! where all thy paths must end,  
However varied be the way they wend.  
Listen! the dead leaves speak; ay, hear thou must:  
    'To dust.'

Where are the careless hearts that on the earth  
Trembled in pain, or beat so high in mirth?  
Those in whose breasts the flame of hatred smouldered?  
    'Mouldered.'

Where are the mighty who take life by storm?  
Who e'en to heaven's heights wild wishes form.  
What croak the ravens on yon moss-grown wall?  
    'Buried all.'

Where are the dear ones in Death's cold sleep lying,  
To whom Love swore a memory undying?  
What wail yon cypress trees?—oh, hear'st thou not?  
    'Forgot.'

To see where these ones passed, did no eye crave?  
May no wild longing pierce beyond the grave?  
The fir-trees shake their weird heads one by one:  
    'None, none.'

The evening wind amid the trees is sighing,  
Fettered in dreams, my saddened soul is lying,  
The twilight falls, the red glow paleth fast—  
    'Tis past.'

## A KNOT OF BLUE RIBBON.

In the year 1864 I was manager of the Willoughby branch of the Metropolitan Bank of Sydney, New South Wales. Willoughby is a country town containing some five thousand inhabitants, situated on the river Hunter. It lies in a long valley, through the middle of which the river flows, for the greater part of its course, between low grassy banks. The staff of our branch comprised myself and three others. The accountant and myself lived together in a suite of rooms adjoining the bank premises. We were very good friends, and had everything in the house in common, though, if we had chosen, we might have lived as much apart as if we had occupied separate houses. Dick Weir was indeed an easy companion to get on with. It was a little time before you came to know him, for he was of a shy and diffident nature, who made friends slowly; but when you did get to be familiar with him, you liked him without exactly knowing why. He was not brilliant, or specially gifted in any way, though he understood his own business thoroughly, and performed its duties skilfully and well. In personal appearance he was not what, at first sight, you would probably call attractive. He had plain, strongly marked features, and an ungraceful, loose figure, which under no circumstances could be made to do credit to his tailor. I don't think there was a continuous line of beauty in his whole figure from top to toe. His eyes were good, however, clear, steady, gray eyes. But as nearly always happens when you come to be friends with a man or woman, you soon grew accustomed to Weir's outward appearance, failed to see its homeliness, and liked the man for himself, for his simple, genuine, and sound-hearted nature. At least this was my case.

Willoughby is a sociable little place, and Weir and myself had a considerable circle of acquaintances in it. The family whose house we most frequently visited was that of Mr Blaxland. John Blaxland was a retired gentleman of property, a hearty, kindly, hospitable man. His house was

pleasantly situated on the bank of the river, and distant about three miles from the town. Mr Blaxland was a married man with two children, a son and daughter. The latter, at the time of which I write, was in her twentieth year, and one of the prettiest girls in the country-side. Ella Blaxland was a good girl too, warm-hearted, frank, and affectionate, willing to please and be pleased on all occasions, a little coquettish sometimes, and fond of fun, but neither vain nor frivolous.

Weir and I were at Wyandra—such was the name of Mr Blaxland's place—sometimes as often as twice a week, and we were always sure of a kindly, unceremonious welcome. No one understood better how to entertain their friends than John Blaxland and his wife, and this without seeming to make much effort in so doing.

As may be supposed, Ella Blaxland had many admirers, but for a long time no one of these seemed to find especial favour in her sight. Nothing could ever be detected in her manner whereby you could gather that she regarded one with more friendliness than another. When such signs did appear, as they did at last, it was in favour of a comparative stranger in the district, one who had but lately come amongst us. This was a matter of no small chagrin to some of Ella's old admirers; but certainly the new-comer had many of the personal qualities such as frequently recommend a man in ladies' eyes. Leonard Hamerton had established himself as a solicitor in Willoughby. Previous to his coming to the district, he had been for a number of years in a well-known solicitor's firm in Sydney, and brought with him letters of introduction to most of the better-class families in the town. Mr Hamerton was a tall, well-made, rather slight man, with fine brown hair and eyes, and a fresh colour. He had a ready, fluent address, helped by a melodious voice; and his manners were easy, assured, and perfectly well bred. He possessed accomplishments, too, which, if not of a deep, were of an eminently useful and effective kind, such as win favour in average society. He could sing, and perform on the piano with taste and skill, knew

whist and most other games at cards thoroughly, played croquet with dexterous grace, and handled a billiard cue in a manner that rather astonished some of our young fellows who thought they knew something in that way. Hamerton was a prudent man. He knew exactly the limits of his own strength, and never attempted anything beyond his range. His country rivals were never successful in tempting him into any of the sports in which they believed themselves to be stronger. He had decided objections to being seen at a disadvantage.

Soon after his arrival in Willoughby, Hamerton became a frequent visitor at Wyandra, and it was not long before his name was mentioned as that of Miss Blaxland's favourite suitor. At first, I regarded this as an idle rumour. Other young men had at different times earned this distinction, and each had in turn quietly lost it. But by-and-by, both Dick Weir and myself thought we saw signs that the popular rumour was at last about to be verified. Ella Blaxland seemed to be regarding Leonard Hamerton with a favour greater than that which she extended to others. This was not very marked; but to us, who were so frequently about the house, it became sufficiently so to be hardly mistakable. I didn't like it myself, for no reasons of a personal kind, for I had never looked upon Ella Blaxland in any other light than that of a friend, and my warmer affections were directed elsewhere, but simply because I didn't much care for Hamerton. I had reason to believe, though he said little about it, that the sentiments with which I regarded him were shared in a great measure by Dick Weir.

It was about two months after Hamerton had come to Willoughby, that a little *fête* was held at Wyandra in honour of Ella's twentieth birthday. It was intentionally a quiet little festival, and those who met to celebrate it were none but the more intimate friends of the family. But we were a very merry and pleasant party. We met early in the afternoon of a lovely day in the end of April, which, it may be necessary to remind English readers, is the Australian autumn. I remember the day by reason of a slight circumstance of which I alone was witness, a circumstance which was a revelation to me at the time, and which afterwards recalled to my memory with added significance. During the afternoon, the larger portion of our party were engaged in croquet, while some wandered about the garden talking and idling away the bright hours. Ella Blaxland was looking especially bright and charming; gay, animated, and happy, as befitted the occasion. She was dressed simply, in some soft, light, airy material, with bits of delicate blue ribbon here and there about her person, and a loop of the same interwoven amid her hair. There were other girls present with undeniable claims to beauty, but Ella moved among them like a little princess, though with no air of conscious superiority. Leonard Hamerton was at his best too to-day, exerting his utmost powers of pleasing. Sparkling, witty, and carelessly gay, he infused mirth into all our diversions, and was confessed, by some tacitly, by others openly, to be the life and spirit of our party.

We were just bringing our croquet contest to a close, preparatory to adjourning indoors for tea, when Miss Blaxland discovered that she had lost one of the ribbons with which the sleeves of her dress were fastened at the wrist. Search was made

by all of us over the croquet-ground, but in vain. It was very strange where the bright knot of ribbon could have hidden itself on that smooth level sward, and we were all sure that Ella had had both her wrist ribbons on when we began our game. Then I suddenly recollected that I had seen Dick Weir, who had not taken part in the game, but had been acting as umpire to us, stoop once while we were playing, and pick up something from the ground, which he hastily placed in the breast-pocket of his coat. I merely thought at the time that it was something of his own which he had dropped, but now it occurred to me with convincing force that it was nothing else than Ella's ribbon which he had picked up. That explained the haste with which he had hidden it away. A minute or two before Ella had missed it, Dick, his services being no longer required by us, had strolled away in the direction of the house. I said nothing, for I was resolved to keep my friend's secret. What I had seen, now put things in a new light. 'So,' I thought, 'is that how the land lies?' Poor Dick; I felt genuinely sorry for him. If he had any hope of ever winning Ella Blaxland's affections, I felt he was doomed to disappointment. But surely he knew this himself by this time.

That evening, as Dick and I rode home together from Wyandra in the moonlight, I said: 'Looks as if it were a settled thing between Ella and Hamerton, don't you think?'

Dick looked round at me, and I saw that his face was very grave, and I thought somewhat pale, but that might have been the moonlight. 'Do you think it's really settled?' he said. 'Well, we both wish her all happiness, don't we?'

There had always been the most friendly intimacy between Weir and Miss Blaxland, but nothing more than I had ever discovered. Dick's name had never been one of those even mentioned among the aspirants to Ella's hand, though they had known each other from childhood, both being natives of Willoughby.

It came to be a matter of general belief in Willoughby that Leonard Hamerton was to marry Ella Blaxland, though nothing definite upon this point could be traced back to Wyandra. Meanwhile, my liking for Hamerton did not increase, and I could not view him as a worthy husband for Miss Blaxland. The strong friendship I had formed for the pretty, kind-hearted girl made me desirous of seeing her marry a man who would be worthy of her, and Hamerton did not impress me with this idea. I felt that this might be in a great measure prejudice, but some of Hamerton's habits of life did not appear specially laudable. Weir and I found him a frequent night visitor of the billiard-room of the *Willoughby Arms*, and this not with the merely innocent object of enjoying a game. He never seemed to care for playing unless for money stakes, and he was always prepared to play as high as his opponents would go. He almost invariably won; and when he did not, it struck me that he had his own reasons for it. In fact, he did much what he liked with such opponents as he met at the *Willoughby Arms*, though they were slow to see it; and his fine talent for the game no doubt brought him in a comfortable little addition to his income. He employed his knowledge of cards whenever opportunity offered, with the same results.

The winter of 1864 is still remembered in New South Wales as that in which one of the largest floods that the colony has ever been subjected to, occurred. The Hunter River district suffered especially, and we in Willoughby did not escape the general destruction. The rapidity with which a flood occurs in Australia is not readily realised by people in the home-country. The rain began to fall in Willoughby at noon of one day, and by dusk of the next the river had risen thirty feet. By next morning half the town was submerged, the water completely covering the ground-floor of many of the houses. Our bank premises stood comparatively high, but we were obliged to abandon the first-floor on the second morning of the flood. Boats were being employed all that day in conveying the inhabitants from the lower parts of the town, and the houses immediately contiguous to the river, to those situated on more elevated ground further back from the stream. Of course, at such a time all business is at an end. Every one who could be of any service employed himself in manning the boats for the rescue of the flooded-out families. Weir and I had been hard at work all day with the boats, and were resting from our exertions, in our little sitting-room after our six o'clock dinner. We were both pretty tired, and did not propose doing anything more that night unless some urgent demand were made upon us. As we sat smoking in silence, Weir said suddenly: 'By-the-bye, did it ever occur to you how the Wyandra people may be getting on?'

'No,' I answered, somewhat slowly; 'it never struck me; but I suppose they're all right; they don't lie very low, and they've the boats.'

'They don't lie very high,' replied Dick, rising to his feet, and standing with his back to the fire; 'and as to the boats, if they have to take to them, who's to man them? You know Mr Blaxland never pulls, and the two gardeners are, I should think, poor enough hands at it. There's a good lot of women-folk about the place, and very few men at this time of the year—none, in fact, I expect, except the gardeners and a boy. By Jove! Jack, we should have thought of this before. But there's no time to be lost. We must find a boat, and get up to Wyandra to-night. Are you game for it, old man? Don't go, if you don't feel up to it. I shall easily be able to pick up a crew at the *Willoughby Arms*.'

'I'm quite ready, Dick,' I answered. 'You're right; as we should have thought of it before.'

We got four men at the hotel, whom we knew to be all sturdy pullers, and a boat.

Wyandra lay up the river, and in making for it, we followed the course of the stream. Had it been in the daytime, we might have saved something by taking a cross-cut, but there was not sufficient light to make such a course now judicious. It was still raining in torrents from the heavy, low-hung heavens, that seemed to be slowly settling down lower and lower upon the earth. The current of the swollen river was very strong, rendering pulling extremely difficult. We were the best part of an hour in reaching Wyandra. Rowing across what was a day or two ago a smiling garden, we approached the house from the front, and found the ground-floor completely submerged. There was an ominous silence about the place, and it was with no slight feelings of misgiving that Weir

and I climbed from the boat through the windows of the second-floor, and entered the house. We found the whole household gathered together in one room: Mr and Mrs Blaxland, and their daughter, three women domestics, the two men-servants, and the boy. They were seated with white faces and cowering forms around the dying embers of a wood-fire, and the whole group presented a very pitiable sight. As we entered the room, John Blaxland started to his feet, and when he recognised us, grasped the hands of both of us with convulsive energy.

'My dear boys,' he cried, 'you are just in time; half an hour more, and the water will be knee-deep in this room! All our fuel is useless too, and we have been half-famished with cold.'

'Dear me, Mr Blaxland,' I said, 'we never imagined you would have been in such a plight; but it was very thoughtless of us. Didn't you think of trying to get away in the boats at first?'

'We put off till it was too late. The two skiffs are such light things, you know, and none of us understood much about the management of boats. We didn't fancy trusting ourselves to them, that's the truth.'

'Well, we mustn't put off time now, sir,' I said.

Dick had been meanwhile doing his best to reassure Mrs Blaxland and her daughter, the former of whom was in a state of extreme nervousness, which the poor lady was in vain exerting herself to control. We got together such shawls and rugs as were in the house and still untouched by the water, and wrapping them about Mrs Blaxland, Ella, and the other three women, made them as comfortable as the circumstances admitted, in the stern of the boat. When all the male portion of the party were seated, and the rowers had taken their places, we found that the boat was already full. One other person it might hold, but not possibly more. Here was a difficulty we had not contemplated. We had taken the largest boat we could get at Willoughby. What was to be done? Weir was prompt with a remedy. He took me aside a moment.

'There is only one thing for it, Jack,' he said; 'I must stay behind.'

'Not while I go,' I replied.

'Now, Jack,' said my companion in a quiet but decided voice, 'listen to reason. It's simply a matter of necessity. There are not two sides to it. Both of us can't go, and one of us must. You must, for you are the best steerer, and it will need all your skill in getting safely back with that heavily laden boat, and through such a sea of waters. I know you would do what I am doing, but you see I must be the one that stays behind in this case. The lives of all in that boat depend upon your going.'

I saw the stern force of what he said. It was imperative that I should go, and it seemed impossible that Dick should go too.

'Well, Dick,' I said, 'I see it must be so. Heaven grant that we may be able to come back for you in time. You will have to take to the roof, I expect; but if you can manage to hold out against the cold, all will be well; I shall get some fresh men at the hotel.'

'All right, old fellow,' said Dick, hurrying me into the boat; 'I shall be all right; don't fear. Just give me your tobacco-pouch, will you? I'll keep life in me till you return. You've got the

brandy-flask, I think, but perhaps you'll need it for some of the women.' He was wonderfully calm and cool.

'No, no,' I said, handing him the flask; 'you'll want it a great deal more than any of them.' I took my seat in the stern of the boat.

'O Mr Weir,' cried Miss Blaxland from her place, 'can you not go with us? Surely we can make room for one more.'

'No, no, Miss Blaxland,' replied Weir. 'The boat is already fuller than is safe. I shall be all right till Jack returns. Push off, men.'

The boat lurched forward into the tumbling sea of waters. I looked back at Dick, and for a moment saw his pale, calm, resolute face watching us from the window; in the next, it was swallowed up in the enshrouding darkness.

The current of the river was now with us, and our progress was more rapid than it had previously been. But our course was more dangerous, from the turbulent violence with which the current was flowing, and from the heavily laden condition of the boat. Steering was extremely difficult, and it was only with the greatest effort that I could keep the head of the boat straight. For that night at least, the only place in which my living freight could be accommodated was our rooms at the bank, and as soon as I had seen Mr and Mrs Blaxland, Ella, and the rest as comfortably provided for as possible, I set off again in the boat for the *Willoughby Arms*. Of my four rowers, one consented to return with me; the other three, though they would have been willing to go with me, declared themselves unable for the work. At the hotel, by offering a sufficient money inducement, I was enabled to obtain three other men.

Back over the dark eddying flood we made our slow way. The rain was falling, if possible, in heavier torrents, and the night had grown thicker. Stormy masses of cloud swept slowly across the lowering heavens, looking as though they might at any moment descend bodily, and overwhelm us in black destruction. It was with a heart beating with anxiety that I sat straining my eyes out into the darkness, as we approached the house at Wyandra. The water had risen high above the windows of the second-floor, and was level with the roof—more than level, the turbid-coloured tide was lapping over the low stone parapet in front. I climbed up upon the roof; I knew that Dick must have been driven from the interior of the house long since. In a stooping position, more often than not on my hands and feet, I groped my way in the rain and the darkness along the sloping shingle roof. For some time I was unable to discover any sign of Weir; I called his name, again and again, but there was no answer. A dread came upon me, that, wearied out as he was by the long and unwonted exertions of the day, he had been overcome by exhaustion, and swept away by the remorseless waters. At last, when hope was fast sinking within me, I stumbled, and tripped against something lying at my feet. I stooped, and found Weir lying with his back propped against one of the chimneys of the house. I lifted him in my arms, and made my way as fast as possible to the boat. Dick was quite insensible, and very cold. I wrapped him in a large rug which I had brought with me, and which had kept tolerably dry in the locker of the boat, poured some brandy into his throat, and

began chafing his hands. For some minutes he shewed no signs of returning animation, and I thought all was over with him. But in a little his lips moved nervously, his eyes opened and immediately closed, and he seemed to go off again as it were in a swoon. Reassured, however, that he was still alive, I bade the men push off, and wrapping the rug closer about the rigid form of my friend, I placed him at my feet, at the bottom of the boat, where I could watch him as I steered. Again we were in the current of the river; the night had grown still darker, and by straining my sight to the utmost, I could see no farther than half-a-dozen yards beyond the boat's head. The current was rushing at headlong speed, and with a deafening roar like the crash of a vast waterfall. The men were using their oars more to steady the boat than to propel her, while we were borne along with an uneasy lurching motion on the swollen, eddying waters. Every few moments a dark object drifted past us—now a dead horse or cow, now a barrel, a ladder, or a hen-coop, waifs from many a ruined homestead. Once a haystack struck the boat sideways, wheeled us round, and all but overwhelmed us in the surging flood. From time to time I bent over Weir and applied the spirit-flask to his lips. It was all that I could do, for I had to give my undivided attention to the work of steering. When we reached the town, the men were all but exhausted. Like the rest, they had been working with the boats all day. One of the three doctors in Willoughby lived close to the bank, and I bade the men stop for a moment at his house. When he heard my story, the doctor immediately accompanied me home.

We laid Dick in his bed. Besides the doctor and myself, Mr and Mrs Blaxland and their daughter were the only others in the room.

With anxious faces we bent over the bed as the doctor proceeded to examine the still insensible form of Weir. He laid open Dick's waistcoat, tore aside his shirt, and placed his hand on his heart. As he did so, something fell out from between the folds of the woollen shirt, and lay on Dick's breast. It was a small knot of blue ribbon. I picked it up and handed it to Ella Blaxland. As she took it, her face, that had been marble-pale before, changed to crimson; a strange, startled look came into her eyes, and she turned hastily from the bedside, and seated herself by the fire. She too recognised the ribbon.

A few moments' examination satisfied the doctor that Dick was still alive, and we proceeded to apply such remedies for his restoration as were within our power. These proved more quickly successful than I had hoped for, and soon we had the satisfaction of seeing Dick slowly returning to consciousness and life. Before the doctor left, he had fallen into a sound sleep.

When he awoke next morning, Dick was completely himself again. When the doctor called and saw him, he pronounced that no grave results had ensued from the previous night's exposure.

On the day succeeding that of the events above narrated, the rain ceased, and the waters receded from the earth almost as quickly as they had risen. But what a scene of desolation they left behind! Far as the eye could reach, the land that a few days before had been green and smiling, lay a dreary waste of wilderness—farms and homesteads, gardens, orchards, and vineyards,

stripped bare by the cruel waters, and left a shapeless ruin. But on these things, familiar enough to many a colonist, it is not my intention here to dwell. It was some time, of course, before the pleasant homestead at Wyandra regained its old shape and beauty; but the Australian soil and climate have quick recuperative powers, and Mr Blaxland's property was restored to its former appearance with a rapidity that would have astonished a stranger in the country.

Leonard Hamerton did not marry Ella Blaxland. It turned out that there had never been any mention of an engagement, either on the part of themselves or Ella's parents—though I have reason to think that Miss Blaxland at one time was really very favourably inclined to Hamerton. But circumstances occurred to change her feelings completely in this respect. Shortly after the great flood, Hamerton disappeared suddenly from Willoughby under somewhat inexplicable circumstances. After his departure, stories got about very little to his credit, chiefly relating to pecuniary matters. There was a good deal of mystery about the whole affair; and it was thought that the young man's friends in Sydney had used their strongest influence to hush the matter up. Enough, however, got abroad to render Hamerton's further stay in Willoughby impossible. He consequently sought a larger field in a neighbouring colony, where he might, if he chose, start afresh, and reform certain of his habits of life.

The place in Ella Blaxland's regard that had been supposed by everybody to have been occupied by Hamerton, was quietly taken by one of a very different stamp, Dick Weir. Of course, everybody was surprised when it came to be known for certain that Weir was to marry Miss Blaxland. It was hardly conceivable! The very last person that any one would have thought of! But so it was. The small world of Willoughby was not behind the scenes, and perhaps its surprise was not very wonderful in this case. Dick did not at once strike you as the kind of man likely to carry off the prettiest girl in a country-side.

### JONATHAN HULLS.

In the autobiography of the late John Barrow, under-secretary of the Admiralty, the following assertion occurs: 'That neither Lord Stanhope, nor Fulton, nor the American Livingstone, nor Patrick Miller, nor his assistant Symington, have the least claim of priority to the application of steam and wheels for propelling vessels. There can be no doubt that Jonathan Hulls was the real inventor of the steam-bout.' This is a bold and dogmatic assertion of Barrow, and would need some investigation. Let us first understand who was Jonathan Hulls, and when did he live.

According to the tradition current in the neighbourhood in which he was born, Hulls was the son of a village mechanic at Hauging-Aston, near Campden, Gloucestershire; the name of the child being entered in a baptismal register, December 17, 1699. Thomas Hull, or Hulls, the father, having removed from Aston to Campden, there the boy was educated at the ancient grammar-school. With a natural turn for mechanics, Jonathan Hulls was brought up as a clockmaker, or rather clock-mender—one of a humble class of artisans whose business it is to make a circuit through a certain

district, cleaning and repairing cottage and farmhouse clocks, as well as the clocks of churches. He married early, and settled in the hamlet of Broad Campden, about 1720.

During the earlier years of manhood, Hulls bore the reputation of being a thoughtful and studious man, and his neighbours are said to have regarded his superior mental powers with no small degree of respect. It is asserted that that idea which has given him some claim to posthumous honour occurred to him while he was yet young, and was matured in his own mind long before any channel was opened through which he could hope to make it known to the world; for Hulls had a family to support, and no means beyond a poor and precarious handicraft. A patron at last appeared in a Mr Freeman of Batsford Park, whose seat (now that of Lord Redesdale) is situated about a mile from Aston, the native place of the inventor. By means of funds provided by this gentleman, Hulls was enabled to go to London, to procure a patent, and to publish a pamphlet in which his invention is described.

His patent is dated December 21, 1736, and it bears the sign-manual of Queen Caroline as witness. In this instrument the invention is described as a 'machine for carrying ships and vessels out of or into any harbour or river against wind and tide;' and it further sets forth that as the inventor could not at that time 'safely discover the nature of his invention,' he was afterwards to enrol a description of the same in the High Court of Chancery.

The little publication in which Hulls attempted to make his scheme known to the world was printed in London in 1737. It is entitled, *A Description and Draught of a new-invented Machine for carrying Vessels or Ships out of or into any Harbour, Port, or River against Wind and Tide or in a Calm*. In his preface he says: 'There is one great hardship lies too commonly upon those who propose to advance some new though useful scheme for the public benefit. The world abounding more in rash censure than in a candid and unprejudiced estimation of things, if a person does not answer their expectation in every point, instead of friendly treatment for his good intentions, he too often meets with ridicule and contempt. But I hope this will not be my case, but that they will form a judgment of my present undertaking only from trial. If it should be said that I have filled this tract with things that are foreign to the matter proposed, I answer: There is nothing in it but what is necessary to be understood by those who desire to know the nature of that machine which I now offer to the world, and I hope that, through the blessing of God, it may prove serviceable to my country.'

The first, and indeed the larger portion of the pamphlet is devoted to the elucidation of such mechanical powers and principles as the inventor considered necessary to the proper understanding of his scheme. The author then proceeds to describe the machine itself, and in doing this he has the assistance of a large copper-plate engraving, which serves as a frontispiece to the work.

In a work like the present, it would scarcely be fitting to enter upon any detailed account of the mechanical contrivances by which Hulls proposed to obtain and utilise motive-power for the propulsion of vessels; but a few words will suffice

to shew to what extent he had anticipated the paddle-wheel steam-vessel of our own day. 'In some convenient part of the tow-boat,' he says, 'there is placed a vessel about two-thirds full of water, with the top close shut; this vessel being kept boiling, rarefies the water into steam; this steam being conveyed through a large pipe into a cylindrical vessel, and there condensed, makes a vacuum, which causes the weight of the atmosphere to press on this vessel, and so presses down a piston that is fitted into this cylindrical vessel in the same manner as in Mr Newcomen's engine with which he raises water by fire.' The motion thus obtained was communicated to what Hulls calls a 'fan,' but which the illustration shews to have been neither more nor less than a veritable paddle-wheel.

In speaking of his invention and the uses that may probably be made of it, Hulls is modest even to timidity. Fearing the objection, that it cannot be made strong enough to bear exposure to the full violence of the wind and waves, he does not dare to anticipate that it can ever be applied to sea-going vessels, but limits its application to tow-boats specially devoted to the purpose—in modern nomenclature, to steam-tugs; and even in these he places his paddle-wheel at the stern of the vessel, as being the least exposed situation.

Towards the close of his book, Hulls refutes various objections which either had been, or which might have been made against his project; such as, whether it be possible to construct machinery of sufficient strength to overcome the resistance of ships of great burden; whether the machine can be worked with profit &c. In conclusion, he says: 'Thus I have endeavoured to give a clear and satisfactory account of my new-invented machine, and I doubt not but whoever shall give himself the trouble to peruse this essay will be so candid as to excuse or overlook any imperfections in the diction or manner of writing, considering the hand it comes from, if what I have imagined may only appear as plain to others as it has done to me, namely, that the scheme I now offer is practicable, and if encouraged, will be useful.'

At the time of its publication, this pamphlet appears to have attracted no attention whatever, and Freeman, unwilling to risk any further outlay, abandoned Hulls and his project. It is therefore evident that the invention did not receive a practical trial, and whatever hopes the projector might have based upon its success were destined to be disappointed.

It is not till 1750 that we have any further documentary evidence with regard to Hulls or his doings, but in that year we find him in conjunction with two townsmen of Campden, R. Darby and William Bradford, schoolmaster, publishing a *Maltmaker's Guide*, shewing how any person may know the duty on any quantity of malt in cistern, couch, or floor. Again, in 1754, we see him making a final effort to bring some of the fruits of his inventive genius into notice. With the same two friends as partners in the undertaking, he now patented a Statical and Hydrostatical Balance, and a New Sliding Rule for artificers, and published pamphlets describing these inventions. The balance is exceedingly ingenious. Hulls defines it as 'an instrument for detecting frauds by counterfeit gold, which gives the weight and shews the alloy of that metal in coin and all utensils made thereof,

and if adulterated, the nature and extent of the alloy.' One of these balances, made by Hulls, is in the possession of the writer. The pamphlet describing the sliding rule bears as its title, *The new Art of Measuring, made easy by the help of a new Sliding Rule*. Coventry: Printed by T. Brooks in Broad-gate, 1754.

Commercially speaking, these last, like all the other ventures of Jonathan Hulls, proved to be complete failures. Incurring some derision for his want of success, he quitted the place where he was best known, and hid himself among the crowds of London. With what might be called a broken heart, he died in extreme poverty, the exact date of his decease being unknown. Down to comparatively recent times, the family of Jonathan Hulls continued to live at Campden, and to hold much the same position as that occupied by himself; namely, that of upright and respectable mechanics. The cottage in which he lived at Broad Campden was long retained by them, and has only recently been pulled down. It was not till the death of the widow of the last descendant of the inventor, in 1865, that the name Hulls disappeared from the district.

Jonathan Hulls is seen to have been a man of no ordinary capacity. We cannot coincide with Barrow in saying he 'was the real inventor of the steam-boat.' But he, undoubtedly, in a rough way, was the first to point out how steam might be employed in the propulsion of vessels. His scheme was clever, but it was purely speculative. From unfortunate circumstances, it did not receive any practical trial, and, like many other efforts of genius, came to nothing. Nevertheless, let us do all honour to the memory of this poor man. His ill fortune may partly be traced to an extreme modesty, which, both in himself and his descendants, negatived the power of superior abilities so far as regarded rising in the world, but still more to his poverty and want of friends. Had he met with a coadjutor possessing the practical talents and ample capital of Matthew Boulton, there appears no reason why his life should have produced less immediate results than that of James Watt. Of the ultimate value of his idea, when, seventy years later, it was developed by men more happily circumstanced, it is unnecessary to speak.

#### WALTER'S WORD.

##### CHAPTER XXXIX.—SIR REGINALD TAKES HIS OWN VIEW.

As Walter descended the mountain, accompanied by Santoro, his reflections did not permit him to pay much attention to the incidents of the way: when they had to let themselves down some precipice, his foot and hand indeed obeyed his will; and when, now and then, his companion bade him listen, in fear that they were approaching the troops, who would certainly have shot them both, without waiting for an explanation, he stopped and listened mechanically; but for the most part his own thoughts preoccupied him, and he only knew, or cared to know, that the direction in which he was advancing with such rapid strides was towards Palermo. The sense of sudden freedom did not occur to him with the force it had done when standing with Joanna in front of the cavern; for he was

even less free now than he had been then; but the question, whether he should have his freedom eventually, agitated his mind perpetually. How many of us, in supreme moments—those of dangerous illness of ourselves or of others; or when prosperity or poverty is trembling in the balance; or when we await 'Yes' or 'No' from lips we love—have said to ourselves: 'How will it be with me to-morrow; or the next hour; or when I shall presently return out of that door?' And so it was with Walter, as, free of limb, but a slave to his plighted word, he descended that Sicilian hill-side. 'How will it be with me four days hence, when I shall have to return yonder, laden with the gold that will be the price of our freedom, or empty-handed, and therefore doomed to death amid unspeakable torments?' Nor was it egotism—though egotism would, under such circumstances, have been very pardonable—that moved the young man to these considerations. Life was dear to him, no doubt, as it is dear to most of us at five-and-twenty, but there were dearer things than life concerned with that alternative which he was considering. If, for example, he should not obtain the ransom, the cause of his failure would in all probability be what Joanna had suggested—namely, the inability of Lilian to prosecute the matter. She might have been too ill even to speak of it, or to place the authorisation in Sir Reginald's hands, on her arrival in Palermo; she might be delirious, and up to this hour have remembered nothing of the charge confided to her; or she might be dead. A cold stone seemed to take the place of Walter's heart, as this last idea occurred to him. If she was dead, what mattered it how it should be with him next week, or any week! He would die too, and thereby avoid breaking his word, for he had said: 'I will return if I am alive.' No; that would be only keeping his promise to the ear: he must live on, for the sake of the poor old man he had just left among those merciless wretches; must do his best for his enfranchisement, or comfort him by his presence in his miserable fate; for would not Lilian have had it so.

'Stop, signor; there go the soldiers,' said Santoro; and on the road which had last come into view before them, could be seen through the trees a considerable body of troops moving towards the city.

'The cordon must be loosening,' observed Santoro, 'unless these men have been relieved. Now is the time to get money up to the camp, if we could only know where it was.'

This was clear enough; and Walter was for pushing on at increased speed; but Santoro bade him pause, lest there should be more soldiers returning home, and they should find themselves between two detachments. The wisdom of this advice was made evident within the next quarter of an hour by the appearance of another body of men almost as large as that which had preceded it.

'The troops have been recalled,' murmured Santoro triumphantly. 'The governor has grown tired of hunting us with the troops, and the road for the ransom is now clear.'

'Let us hope so,' answered Walter servently; 'but is it not possible that they have intercepted it?'

It was not unusual in similar cases for the government to direct its division among the troops; for though it made feeble efforts to put down the brigands, it was high-handed enough in its measures respecting the illegal payment of the ransoms of their victims.

'No, no; the soldiers would have talked and sung as they went by, had they had any success. Take my word for it, they have given up the whole thing, and have gone home in disgust.'

At all events, Walter and his companion met with no further hindrance, and reached Palermo before dusk. Santoro, it was agreed, should not enter the city in his company, lest his connection with the brigands—though, having divested himself of his arms and jewels, he looked as 'indifferent honest' as any other of his fellow-countrymen—should be taken for granted; and the gate of the English burial-ground having been fixed upon as a place of rendezvous every evening, in case they should wish to communicate with one another, for the present they parted; Santoro, in the highest spirits at the prospect of a few days of town-life, directing his steps to some friends in the neighbourhood of the Dogana, and Walter to the hotel upon the Marina at which Sir Reginald had lodged, and to which he did not doubt that Lilian would have been carried. He had some hesitation as to whether he should ask to see her, or the baronet; but on consideration of the importance of the matter at stake, which seemed to override all ordinary and conventional rules, he determined on presenting himself to Lilian. But, in the first place, it was absolutely necessary that he should seek his own lodgings on the Marina. Unshaven, unwashed, ragged, and scorched with the sun, he looked more like a native beggar than the young English gentleman who had embarked in pursuit of the *Sylphide* some fifteen days ago. Baccari, who was standing at his house door, did not even move aside as he approached, but regarded him with no very favourable expression.

'I have nothing for you, nor such as you,' said he, anticipating from this able-bodied but dilapidated stranger an application for alms.

'What! Baccari, has a fortnight's stay with Captain Corrali, then, so altered your old lodger?'

In a moment, the honest little fellow had thrown himself about Walter's neck, and was weeping tears of joy.

'Thanks be to Heaven and all the saints,' cried he, 'that you have returned alive! Come in, come in! What a spectacle do I behold! Nothing has happened like it since my neighbour Loffredo's case. O the villains, the scoundrels! Welcome home!—A bath? Of course you desire a bath. I recognise you for an Englishman by that request, though, otherwise, you might be a countryman of my own—and, by Santa Rosalia, not one of the most respectable. You must be half-starved, my dear young sir; still, you are alive, and have come back again from that den of thieves. How delighted Francisco will be! The poor youth has never been himself since you left him, in spite of his good advice, and fell into the hands of those ruffians. Signor Pelter, too, I shall not now have to write to him to say: "Our friend has been put to death by brigands." While supplying his

guest with food and everything needful, the good lodging-house keeper did not, in fact, for a moment cease expressing his thanks to Providence, and his congratulations on Walter's safe return. For the time, such genuine manifestations of good-will, succeeding to such hard conditions of life as those to which he had been of late accustomed, quite won the young painter from his despondency, and almost convinced him that he had really regained home and safety. But no sooner had he recruited his strength, and attired himself in a decent garb, than the responsibilities of his mission began to press upon him. Indeed, more than once had an inquiry concerning Lillian been upon his lips, which, nevertheless, he had not the courage to frame. At last, he turned round boldly to his host. 'And now,' said he, 'tell me about the English lady whom Corrali caused to be sent back to Palermo. Since her father is still in his hands, I am come hither to effect the payment of his ransom.'

'Ah! the ransom. Well, yesterday, I should have said you would have had but a bad chance, even supposing, as I do not doubt, that you have the means of raising the money. The governor, you see, is very indignant at the outrage, since it has happened to a rich Englishman, and not to a poor devil of a fellow-countryman like myself. Sir Reginald, too, and the British consul have been very importunate with him. Half the troops in the city have, therefore, been sent out to hunt the brigands, with strict orders, also, you may be sure, to let no money-bags pass through their lines. But to-day, as I hear, the soldiers have been recalled, since Corrali and his men have taken their departure towards Messina.'

'But the young lady—Mr Brown's daughter—you tell me nothing of her?'

'Well, indeed, my dear young sir, there is but little to tell; no one has seen her, since she was brought home to the hotel yonder, more dead than alive, except her sister and Julia?'

'Who is Julia?'

'Oh! that is the waiting-maid whose services have been secured for her, and about whom my son Francisco will tell you a great deal more than I can. I am very much afraid that the boy will marry her; and then there will be a family to keep by fishing, I suppose, and the little I can afford to contribute. They will want the house, too, for the children, and I shall be no longer enabled to let lodgings.'

'For Heaven's sake, tell me about the young lady! Is she worse or better? Is she in danger?'

'I don't know about danger, but she is still very ill, I believe, and, unfortunately, wandering in her mind. The sun, it seems, was too much for her during that noontide journey, and she was ill before. My good sir, where are you going? It is out of the question that she should be able to see you.'

'Then I must see Sir Reginald,' said Walter decisively; 'it is upon a matter that does not admit of a moment's delay.' Upon the whole, he thought it wise not to communicate to the talkative Sicilian what the matter really was; if the authorities had really opposed themselves to the money being paid, the more secretly the affair was managed the better.

'Well, if it is about milord's freedom and the ransom,' observed Baccari with an aggrieved air,

'you may consider that as a public topic. Every one is talking about it: some say one thing indeed, and some another, but I can tell you this much—who have, unfortunately, had some experience in these matters—that, hitherto, Sir Reginald and the rest of them have been going the wrong way to work to procure your countryman's freedom; and not only the wrong way, but the very way to prevent it. Let the gold be put in a box—the money must be paid in gold, of course—and let it be carried out at night up to Corrali's camp; then milord will come down in the morning, a little thinner, perhaps, and by no means pleased with our Sicilian ways (none of Corrali's captives are); but, after all, there will have been no harm done. Whereas, to send troops after these gentry is the way to make them flit—flit like cloud-shadows, from hillside to hillside, take their prisoner with them, until one day they get tired of carrying him about, and cut his throat.'

'That is precisely my own view of the matter,' answered Walter thoughtfully.

'Just so; and you have had a personal experience. Up to this moment, you will bear me witness, my dear young sir, that I have not put one question to you; though I have been hungering to learn your adventures almost as much as you were for your dinner. How did you fare? How did you sleep? Were there more than fifty of those scoundrels? (for that is what is reported). Did you see Joanna, who is dressed as a man?'

'My dear Baccari, I will tell you all that another time, but, for the present, I have not a moment at my own disposal.'

And Walter took up his hat, and turned his steps to the hotel, which was but a few paces off. The brief exhilaration caused by good food and clean raiment—and by the latter scarcely less than the former—had now passed away, and his mind was full of forebodings. If he should be really unable to gain speech with Lillian, it would be difficult, he knew, to persuade Sir Reginald to change any course of action which he had once seen proper to adopt—difficult under any conditions; but now that they had ceased to be friends—not to say had become enemies—it was a task of which he well-nigh despaired. It was true there were other strings to his bow—the bankers, the consul, to be applied to, with whom, surely, his late experience, and the conviction that was borne of it, must needs have weight. But even his own impressions—notwithstanding that he felt himself as much tied and bound by his promise to the brigand chief as ever—were far different, now that he was free and among friends, than what they had been when in captivity; and he was well aware that it would not be easy to convince men who were living at home at ease, of the desperate condition in which himself and the old merchant really stood. On arriving at the hotel, therefore, notwithstanding that such a proceeding might of itself enrage Sir Reginald against him, he asked to see Miss Lillian Brown. The porter, however, accustomed to continual inquiries upon the part of the British residents after her health, misunderstood his words, and replied that the young lady's condition was slightly improving, but that she had not yet recovered her senses. This was as bad as anything Walter could have expected, and of course put a stop to any idea of a personal interview.

'I wish to see her brother-in-law, Sir Reginald Selwyn,' observed he, 'upon business of great importance.'

'Very good, sir. This way, if you please.'

As Walter followed the man up-stairs, the terrible thought invaded his mind, that perhaps this poor girl had not been in her right mind since her arrival; that nothing had been done with respect to the authorisation, and that everything connected with the ransom would have to begin *de novo*. If the bankers in Palermo were as dilatory as the rest of their fellow-countrymen in matters of business, the time before him was short indeed. Walter was ushered into a sitting-room upon the first-floor, and requested to wait, while his name was sent up to the baronet.

'It is unnecessary to give my name,' said he, after a moment's reflection; 'you may say an old acquaintance from England.'

It was just possible, he thought, that Sir Reginald might decline to see his quondam friend, after what had happened at their last meeting at Willowbank; and, moreover, he wished to judge, from the baronet's countenance, whether his presence in Palermo took him by surprise or not; since, if it did, it would be proof that Lilian had never been in a condition to relate to him what had taken place during her captivity. It was nearly a quarter of an hour before Sir Reginald made his appearance, expecting, doubtless, to see some casual London acquaintance, who, finding him at Palermo, had dropped in for an evening call.

His countenance changed, directly he set eyes on Walter; he did not, however, seem so much surprised, as annoyed and disappointed: his look of conventional welcome at once gave place to one of dislike and suspicion.

'This is an unexpected pleasure, Mr Litton,' said he coldly, and pointing to a chair.

Walter sat down. Such a reception was almost an insult, but the circumstances were too serious to admit of his taking offence.

'You knew I was in Palermo, Sir Reginald, or at least that I had been so, I conclude?'

The baronet hesitated: 'Yes; I have heard so.'

'And also that I had been taken prisoner by the brigands, in company with your father-in-law, who is still, unhappily, in their hands?'

'I did not hear that you were in his company when taken prisoner; indeed, I had reason to suppose that such would hardly have been the case.'

This allusion to the merchant's quarrel with Walter, fomented as it had been by the speaker himself, and indeed solely attributable to him, was almost too much for Walter's patience; still he kept his temper.

'I was made captive, Sir Reginald, as you say, not in Mr Brown's company, but in the attempt to give the alarm while there was yet time; I hoped to effect his release by force of arms. That time is unfortunately past; and it is my painful duty to inform you, that if immediate steps are not taken to pay his ransom, his life will without doubt be forfeited.'

'That is what Captain Corrali says, I suppose,' observed Sir Reginald contemptuously.

'He has said so, and, in such a matter, he will, without doubt, keep his word. If, within four days, the whole three hundred thousand ducats are not in his hands'—

'Why, that is fifty thousand pounds!' interrupted Sir Reginald: 'a modest sum, truly, to be asked for by a highwayman.'

'But is it possible that I am telling you this for the first time?' exclaimed Walter, feeling that his worst fears were indeed realised. 'Did not Miss Lilian tell you with what mission she was charged?'

'My sister-in-law was brought to the city in a dangerous and almost desperate condition, quite unfit to attend to any matters of business.'

'Business! But this is an affair that concerns her father's life. Do you mean to tell me that she never gave you the authorisation for the payment of the money, which I saw Mr Brown write out with his own hand?'

'I have seen no such document, nor is any such in Miss Brown's possession,' answered the baronet steadily. 'As to the enormous sum you have mentioned, it is true that she has spoken of it more than once, but it was very naturally taken as the utterance of a disordered intellect. She has been wandering in her mind—as well as prostrated by fever—ever since her return.'

'The sum is perfectly correct, Sir Reginald, and not a ducat less will be taken by the brigand chief. It is the price of Mr Brown's life—and of my life also (though I do not wish to speak of that), since I have promised to return either with or without it within four days. We are both dead men, if'—

'Excuse me, Mr Litton,' said Sir Reginald, smiling, 'if I recommend that you should take some rest and refreshment before you speak any more on the topic. It evidently excites you, and if, as I conclude, you have just escaped from these scoundrels' hands, you are hardly fit to judge of them dispassionately. You are naturally disposed to exaggerate their power and determination, and to give them—or rather to persuade others to give them—whatever they choose to ask.'

'Sir Reginald, I am as cool and collected as yourself; I have told you nothing which is not true, except that it is not the whole truth. Your father-in-law will be put to death—of that I am satisfied—in some most cruel and shocking fashion, if you turn a deaf ear to what I say. Ask any one in Palermo who is acquainted with the brigand customs in such cases, and I am confident they will bear me out in what I say.'

'I scarcely think you are quite aware of what you say, Mr Litton,' answered the other, in a cold calm voice: 'you just expressed your resolve to return in person to these gentry, in order that you yourself may be put to death. You are a little eccentric in your conduct (if you will permit me to say so) even now, but you would, in that case, be stark staring mad.'

'I know that many people think it madness to keep their word, when it happens to be to their disadvantage,' answered Walter quietly; 'but that is beside the question. I am pleading for your father-in-law, not for myself. And I must insist, in his name, and for his life's sake, that an immediate search be made for the authorisation of which I have spoken.'

There was a short pause, during which the baronet frowned heavily and bit his lip, as though in doubt. 'The word "insist" is one which is utterly out of place in this discussion,' observed he presently; 'but I make allowance for your

excited condition, which, indeed, the circumstances of the case may well excuse. Moreover, I should be loath, for old acquaintance' sake, to refuse you satisfaction in so simple a matter.' Here he rang the bell, and bade the servant request the presence of Lady Selwyn. 'My wife,' said he, 'who is in constant attendance on her sister, shall at once make search for the paper of which you speak. I conclude you will trust to her report, if not to mine.'

'Trust, Sir Reginald!' echoed Walter excitedly. 'Do you suppose, then, that I think you capable of having ignored this authorisation, or of concealing it? Why, if you knew of it, and yet kept it back, you would be a murderer—ay, just as much the assassin of your wife's father!'

'Here is my wife,' broke in Sir Reginald. 'Pray, keep this extravagant talk of yours, Mr Litton, somewhat within bounds, or at least reserve it for male ears.' He spoke with sharpness as well as scorn, but Walter heeded him not; his whole attention was riveted by the appearance of Lotty, who was standing pale and trembling at the open door. She had evidently heard his words, and was looking at her husband with inquiring yet frightened eyes. 'A murderer!' she murmured—'an assassin!'

'Yes; those were the words this gentleman used, and which he applied to me, madam,' said the baronet scornfully. 'Does it appear to you that I look like one or the other?'

'But what does he mean, Reginald?'

'Gad, madam, that is more than I can tell you. He has been raving here these twenty minutes about his friends the brigands, who have sent him, it seems, for a trifle of fifty thousand pounds, as the price of your father's release.'

'As the price of his life, Lady Selwyn!' answered Walter solemnly. 'He wrote out an order on the bankers for that sum, and sent it by your sister's hand; but Sir Reginald tells me it has not been found. I adjure you, if your father's existence is dear to you, to discover what has become of it.'

'Indeed, Mr Litton, I will do my best,' said Lotty, with a glance at her husband, such as those animals who have been trained to do things contrary to their nature always throw at their master before commencing a performance. 'My sister is very ill!'

'He knows all that,' interrupted Sir Reginald hastily. 'She is much too ill, of course, to be interrogated on any such matter. But, if the authorisation—this document Mr Litton speaks of—was confided to Lilian, it must, of course, be still in her possession.—I don't say that I would act upon it, mind, even if it was found, sir,' added he, as his wife left the room; 'my idea is, that one should never treat with these scoundrels save sword in hand; that we should give them lead and steel—not gold.'

'Nay, Sir Reginald; I am sure if you were to read your father-in-law's words, written as they were in the dire expectation of death, these scruples would weigh as nothing.'

'Well, well, we shall see. I need not trouble you to wait; but in case of Lady Selwyn's finding this document, I will send word of the fact to your address, if you will furnish me with it.'

Sir Reginald took out his tablets, and wrote down the number of Mr Baccari's house, like any other trifling memorandum.

His coolness seemed frightful to Walter.

'And if the document is *not* found, Sir Reginald?'

'Well, really, in that case, I cannot see what is to be done, more than has been already done. The troops were promptly sent out, and in considerable force!'

'They would have been useless in any case,' put in Walter earnestly; 'but, as it happens, they have been withdrawn!'

'Indeed! I had not heard of that,' returned the other quickly.

'It matters not. I repeat, that all armed intervention would be useless.'

'You must really allow others, as well as yourself, Mr Litton, to exercise some judgment in this affair. The British consul, the governor of the town, and the humble individual who has the honour to address you, are all of one opinion, and it is diametrically opposed to your own. As to the other matter, you shall be communicated with, if the necessity arises. Good-morning to you.'

Walter rose, and left the room without a word. He could not trust himself to speak more with this man, who treated the capture and death of a fellow-creature—not to mention that he was a near connection of his own—with such philosophic indifference. He could not imagine that he had utterly failed to convince Sir Reginald of the peril of his father-in-law's position. On the contrary, a dreadful suspicion had taken possession of him, that the baronet was well aware of it, and had his own reasons for affecting to ignore it. Why should it have entered into his mind that he (Walter) would not believe his report concerning the existence of the authorisation, unless he had been conscious of a wish—perhaps of an intention—that it should not be found? If Lilian, who was said to be seriously ill, were to die, the whole of her father's wealth, should he be put to death by the brigands, would revert to Sir Reginald, through Lotty. The perspiration stood upon Walter's brow, at the contemplation of such wickedness as these ideas suggested, but yet they remained with him; he did not, as of old, repent of having entertained such evil thoughts of his former friend; he felt that Selwyn was a selfish, heartless fellow from skin to skin. Moreover, the look of suspicion, as well as dread, that his wife had cast upon him, when Walter had said that he who would keep back the document would be almost as guilty as Corrali himself, had not been lost upon him; it seemed to imply, not, indeed, that Sir Reginald had done such a thing, but that the person who knew him best conceived it possible that he might be capable of doing it. These thoughts crowded upon him as he sat alone in his little chamber waiting for news from this man; there was no relief to them, unless the picture of Lilian wasted to a shadow, as he had seen her last, but with her beautiful eyes lacking the light of reason, could be called a relief. When an hour had thus passed by, he could bear it no longer; inaction had become intolerable to him, and he once more bent his steps towards the hotel. His importunity seemed to have been anticipated, for no sooner had he again inquired for Sir Reginald, than he was informed that the baronet had stepped out, but had left a message to the effect that 'he had nothing further to communicate to Mr Litton.' As he left the door, the gun at the observatory

announced to the townsfolk sunset—to him, that one day of the allotted four he had yet to live had expired.

#### CHAPTER XL.—A GLEAM OF HOPE.

It was too late that night to call upon the consul or the bankers, on whom, indeed, his mind misgave him it would be of small use to call in any case; but a sudden impulse caused him to seek the gate of the English burial-ground. Even if Santoro were there, he could obviously afford him no assistance; and it was to the last degree improbable that he should be there, on that first evening of their arrival, and when he might naturally conclude that the young Englishman would have no need to see him. Yet he went on the bare chance of his being there. His heart seemed to yearn for the one companion with whom, if he had no sympathy, he had at least something in common, who shared with him that knowledge of his own perilous position which it seemed impossible to induce any one else in Palermo to share. The broker's man who sits in possession of the poor man's goods may not take pity upon him, but he knows the sad fact of the position, and is so far preferable to the friend who ignores his ruin, or disbelieves it, and would fain have him shout and sing.

Finding Santoro at the spot agreed upon—'Why, you could hardly have expected to see me so soon?' said he.

'I did not expect it, signor; but I had my orders not to lose a chance of communicating with you.'

'Indeed! It struck me that the captain did not trouble himself much about the matter.'

'It was not the captain; it was la signora,' answered the other significantly.

Walter felt the colour come into his cheeks, as he replied as carelessly as he could: 'But you are not one of la signora's men; I understood that only those two who came up from the cavern were under her directions.'

'That is so, signor; but one that is dear to her is very dear to me.'

'Ah! Lavocca?'

'Yes, signor. So I would go through fire and water to serve her,' answered he simply. '--'Have you any news?'

'Bad news. It is that I wished to see you about. The authorisation which Mr Brown sent for the payment of the ransom is not to be found. Are you sure that no one could have possessed himself of it, while the English lady was being brought back?'

Santoro shook his head. 'That is impossible. In the first place, it would have benefited no one; and in the second, no one would have dared.'

'That is also my opinion. But, at all events, it has disappeared, and without it, I fear not a ducat can be raised. My idea is, that you should return at once to the camp, and bring back another order from Mr Brown.'

'But that would be very dangerous, signor.'

'How so, when the troops have been withdrawn?'

'Oh, the troops are nothing; it is Corrali himself that I should fear to meet. It is contrary to his wishes that we came down here: his patience is already exhausted, and he would not believe one word of such a tale as this. My return, I feel confident, would be the signal for putting milord

to death at once. You don't know the captain's temper, signor. And then there is Corbara to egg him on. Of course, I will go, if such is your wish, but that is my conviction.'

In vain Walter attempted to move Santoro from this opinion, delivered with all the gravity of a judge *in banco*. It was certain that he was in the best position to speak positively upon such a matter; and he had no motive for misrepresenting it. Walter felt convinced, against his will, that upon himself alone depended the success of his mission. Yet without the authorisation, how could he hope to induce the bankers to advance such a sum, or the tenth part of it? To be sure, he had Mr Brown's credentials in the paper he had given him at parting, which begged them to put confidence in the bearer, and to hasten matters as much as possible; but what was the tag of the play without the play itself. If the sum had been a thousand pounds, or even five thousand, it might easily enough have been raised, under such an urgent necessity; but fifty thousand pounds! He felt that the task he was about to undertake was almost hopeless; but yet he must needs attempt it, by whatever means he found available. He shook hands with Santoro, and returned alone to his own lodgings. Francisco met him at the door with, for him, quite extravagant signs of welcome and satisfaction.

'I never thought to see your face again, signor,' exclaimed he. 'I was right, you see, about these gentlemen of the mountains. Well, you have seen Corrali face to face, and yet escaped him with a whole skin and a whole purse. That is what no other man in Sicily can say for himself, save you and me.'

Walter did not think it worth while to deceive him; he was resolutely bent upon returning to the brigands; but he did not wish to be made out a martyr, nor even, as Sir Reginald called him, a madman, for so doing; he felt that his own opinion and that of the world, as to what was right to be done, would be at variance, and he did not wish to discuss the matter.

'Then the young lady too,' continued Francisco with quite unwonted loquacity; 'she has reason to thank her stars, for it is better to be ill in Palermo than to enjoy the best of health yonder,' and he pointed towards Mount Pellegrino, 'without a roof to one's head, and among bad company. They say that Joanna is a she-devil.'

'Then they do her a great injustice, Francisco,' answered Walter gravely. 'But how did you know that the lady had been with Joanna?'

'Oh, well, there is a friend of mine, a young woman at the hotel, who has no secrets from me, and as it so happens, she is the signora's nurse for the present.'

'But did the signora tell her, then?'

'I suppose so. Who else? Certainly she told her.'

'But Sir Reginald himself informed me that she was delirious—not capable of understanding what was said to her.'

'I believe that is so. She chatters on, poor thing—so Julia tells me by the hour together. Can you guess one particular person whom she talks about, signor?' The boy looked roguishly up in Walter's face. 'Ah,' I say to Julia, "when you go out of your mind, you will talk of me, as your mistress talks of Signor Litton."

Under other circumstances, the piece of information would have had an interest for Walter absorbing enough—though, indeed, by this time, he possessed the full assurance that Lillian loved him—but there was something else that the lad had dropped which riveted his attention even more.

'Then, when the lady first came back to Palermo,' returned he anxiously, 'she was aware of all that had happened to her? It is only lately that she has lost consciousness. Is that so, Francisco?'

'I believe so. I will ask Julia, if you like, when I see her next.'

'By all means ask her. But when will you see her?'

'Perhaps to-morrow, perhaps not till the day after; it depends upon the signora's state whether she can get away or not. But the next time she shall give me all particulars: you may look upon the matter as settled.'

This information moved Walter greatly, as corroborating his worst suspicions, for, if it should turn out to be correct, it must needs follow that there was foul play on the baronet's part with respect to the concealment of the authorisation, or, at all events, of Lillian's mission. She would hardly have spoken of her imprisonment, and of Joanna, without mentioning the very purpose to effect which she had obtained her freedom.

The next morning, as soon as business hours commenced, Walter presented himself at the British consul's, and told his story, to which that official listened with attentive courtesy. Nothing, however, he said, could be done, so far as he was concerned, more than had already been done. The authorities at Palermo had acted promptly, and as duty plainly pointed out to them, in sending forth the troops; and all that he could do, if it was indeed the case that they had been withdrawn, would be to demand that they should make another attempt to compel the brigands to surrender their captive. As to the ransom, it was not to be expected that the Sicilian government would assist in its collection, or even countenance its payment. That was a matter for the consideration of Mr Brown's bankers.

All this, Walter felt to be perfectly reasonable; but what secretly galled him was, that beneath all this polite logic, he could plainly perceive a profound incredulity, not, indeed, in his story, but in the reality of Corrali's threat. It was evident that the consul had not become acclimatised, but still believed the personal safety of a British merchant to be invincible even from a brigand. That Mr Brown might be shot in a skirmish, he believed to be probable enough; but that he should be put to death in cold blood, was something out of the region of possibility. Walter congratulated himself that he had made no mention of his own peril, since he felt that his anxiety would in that case have been set down to an exaggerated sense of personal danger. At the English banker's, to which the consul was civil enough to accompany him, he was admitted to an interview with one of the members of the firm, and at once presented Mr Brown's memorandum—'Spare no expense; trust implicitly the bearer.'

'Bearer!' repeated the man of money; 'why, this is almost as bad as a blank cheque.'

Here the consul interposed with a few hurried words in Sicilian, which, though he caught their

meaning but indistinctly, made Walter flush with indignation. He perceived he was indebted to that gentleman's good offices for convincing Mr Gordon that he was really the person indicated in the document.

'You see, sir, this is a matter of business,' explained the banker; 'and when we are asked to put implicit confidence in a man, we like to be sure it is the right man. It seems unlike a man of business such as Mr Brown that he should have written such a memorandum at all.'

'If you were half-starved, and surrounded by brigands with cocked pistols, sir, you would not be so scrupulous about technicalities,' observed Walter, still a little sore at the nature of his reception.

'We are well aware of Mr Brown's misfortune, and regret it deeply,' answered the banker with stiffness; 'but still the form'—and again he looked at the slip of paper suspiciously—'is unusual.'

'It is, however, but the corollary of a document that should have been long ago in your hands, Mr Gordon—an authorisation for the payment of three hundred thousand ducats as ransom.'

'Three hundred thousand ducats!' exclaimed the banker. 'Why, that is preposterous!'

'No doubt, it appears so; yet, if one possessed the money, one would, I suppose, give it to save one's life.' And with that Walter once more told his story.

It was plain the banker was much moved, for he had lived much longer in Sicily than the consul, and therefore knew more of brigands.

'Well, it is a huge sum,' he said; 'and to raise it within so short a time, we shall require help from the other banks, which, however, will no doubt assist us in such an emergency. Mr Christopher Brown has no account with us to speak of, but his name is no doubt a good one. It will be a great risk, and yet one which, under the circumstances, it may be our duty to run.'

Walter felt as though this man were giving him new life; he had heard, and had believed, that money could not save men from death, but here was an instance to the contrary.

'However, no step can, of course, be taken in the matter without the production of the authorisation,' continued the banker.

'Alas, sir, I have told you that it cannot be found.'

'But if it is not found, Mr Litton, it must surely be plain to you that you are taking up my time to no purpose. Not that I grudge it to you, under the circumstances; but you cannot be serious in expecting us to raise a fortune upon such a security as *this*—and he held out the slip of paper between his finger and thumb, in a very hopeless manner—for an almost total stranger.'

'Then, God help us!' said Walter.

'In what relation do you stand towards Mr Brown, young gentleman?' asked the banker, struck by the earnestness of this reply.

'I am only his friend, sir, and his fellow-sufferer.'

'But I understood that he had relatives with him.'

'He has two daughters—one of them, as I have told you, seriously, I fear dangerously ill—and a son-in-law, Sir Reginald Selwyn.'

'But surely it was his duty to have accompanied you here to-day; and once more, as it seemed to Walter, there came into the banker's face that look

of distrust with which he had first greeted the presentation of his credentials.

'Sir Reginald is not aware of my visit to you, Mr Gordon, nor even of my possession of this paper. I came straight from Mr Brown himself, who had no reason to doubt that the authorisation was in your hands.'

'Let it be searched for thoroughly, Mr Litton. If it is not found, you must perceive for yourself how utterly futile is any application to our firm.'

'Forgive me, sir, for having taken up so much of your time,' said Walter, rising; 'that I was pleading the cause of a dying man—one whose life, that is, is as good as lost if this money be not paid—must be my excuse.'

He said not a word concerning his own peril, nor, indeed, at the moment did it occupy his thoughts. The hardness, if not the villainy of Sir Reginald; the misery of Lotty; the pitiable condition of poor Lilian, unable to speak a word upon a subject so vital to her father; the old merchant's impending fate—all these things oppressed Walter's mind, and made the world by no means a place that he felt loath to quit. The despondency and despair in the young man's face touched the banker's heart.

'Search, I repeat, Mr Litton, for this authorisation,' said he more kindly, as he held out his hand; 'but if it cannot be found, still come to me again, to-morrow at latest. Indeed, we will do for you what we can.'

With which poor gleam of hope, Walter took his leave.

#### THE MONTH: SCIENCE AND ARTS.

THE Polar expedition sails amid a chorus of good wishes, and if these could avail, success would be certain. But the equipments of the two vessels are such that a lively hope may reasonably be entertained that the grand object of the adventurous undertaking will be achieved. No pains and no expense have been spared to provide against unfavourable contingencies; and while extending the limits of geographical discovery, and solving the question of the polar sea, the explorers will use their scientific appliances in the observation of physical phenomena, which, in those high northern latitudes, are of unusual interest. In order that the observers may know what has been done and what to do, a *Manual* has been prepared in which the several subjects of inquiry are fully set forth. When we mention that the *Instructions* have been drawn up by some of the ablest Fellows of the Royal Society, readers will understand that the claims and objects of science have been properly advocated. Instruments of a construction never seen before will be employed in physical research, and with these, explanations may be arrived at on questions which have hitherto baffled inquiry. The spectroscope and polariscope will be used in observation of the aurora and other phenomena of light; pendulum experiments will reveal somewhat more than is at present known of the true figure of the earth; and the so-called 'cosmic dust' is to be an especial subject of investigation.

If in the snow of the far remote north, hundreds of miles beyond human habitation, metallic particles are found, as in the snow of Sweden, then the theory that there is really such a thing as 'cosmic dust' may be accepted, until a better explanation shall be found.

Botany, geology, natural history generally, the rise and fall of tides, the direction of currents, together with dredging and sounding, will be equally well cared for; and ample means for recreation and amusement have been provided. In one of Parry's voyages the preparation and printing of a newspaper enlivened many an hour of the long dark winter; we learn, therefore, with satisfaction that the present expedition carries a printing-press.

The question has been asked, how, during the four months of constant daylight, are boat-parties when away from the ships to tell day from night? The answer is, by means of time-keepers constructed to shew twenty-four hours on the dial. Supposing 1--12 to be the day hours, then 13--24 will be the night hours.

We mentioned last year Mr Crookes' discovery of certain remarkable phenomena of attraction and repulsion, under the influence of radiation. Since then the investigations have been continued; and a fresh series of experiments, exhibited at meetings of the Royal Society, have furnished food for thought to minds familiar with the theories and facts of physical science. When a wheel, inclosed in a vacuum, begins to spin round as soon as a lighted candle is placed near the glass receiver, and continues to spin as long as the light continues, or spins twice as fast if there are two candles—an effect is produced which no one can as yet explain, but which is pregnant with important consequences for physical science. And when we see a small bar of pith, suspended as a scale-beam, dip down under the influence of a ray of light, are we to accept the phenomenon as an illustration of the suggestion made by speculative philosophers that light is a ponderable? In any case, the future of Mr Crookes' experiments seems full of promise.

Captain Belknap of the United States navy, who has been cruising in Japanese waters, reports that in his sounding operations, the machine invented by Sir William Thomson 'had it all its own way, and so admirable has been its working, and so accurate are its results, that it seems to be no more than due to the genius of Sir William to say, that the appliances for what may be not inaptly called the perfection of deep-sea sounding, originated with him.' We mentioned this machine in a recent *Month*, and some readers will remember that steel wire, such as is used for the strings of a pianoforte, is the sounding-line. The contrivances to control the descent, regulate friction, and mark the depth, are ingenious. 'So perfect and unmistakable are the indications at whatever depth, that a person standing in any part of the ship, and looking at the machine, can tell the moment the bottom is reached.' And not least among the advantages of the Thomson machine is the fact,

that a deep sounding can be taken with the wire in half the time required with a hempen line.

We learn from the *Proceedings* of the Institution of Mechanical Engineers, that the use of water-power instead of steam-power in engineering works and mechanical operations is on the increase. Especially in the work of riveting, the pressure of water is found advantageous; it is given without concussion, and is so certain, that boilers can now be made perfectly steam-tight. Boilers ought never to be made otherwise; for if calking is required, it is a sign of weakness and bad workmanship. The plates of a boiler should be absolutely close: calking tends to separate them, and is a bungling operation. Hence, it is satisfactory to be informed, that 'at the present time there are more than a hundred hydraulic riveting-machines in regular work in this country, each exerting a closing pressure of from twenty-five to forty tons, and putting in daily from fifteen hundred to two thousand rivets each.' Another advantage of these machines is, that they can be made portable, and set to work wherever required. A case in point is one of the bridges of the metropolitan extension of the Great Eastern Railway, where a riveting-machine put in three hundred three-quarter inch rivets per hour, and enabled one gang of hand riveters to do as much work as could have been done by six gangs without the machine, and to do it better.

It is probable that more and more applications of water-pressure to the moving of machinery and of workshop tools will be discovered. It is already employed for the flanging, bending, and corrugating of plates, and for the 'shearing,' or cutting in two, of chain cables. In this latter operation the pressure is at times two thousand pounds to the inch, and large links are cut through at one stroke without injury to the adjoining links.

In connection with the foregoing, we mention the use of machinery worked by compressed air in coal-mines. This also is on the increase: the loss by leakage is comparatively trifling; there is no inconvenient development of heat, as in the use of steam; the air that escapes improves the atmosphere of the mine; and some of the proprietors in the South Wales coal-field are so convinced of the benefits to be derived from the use of compressed air, that 'it is their intention to dispense with animal power altogether, and substitute air-engines for hauling underground.' In the Powell Duffryn collieries, there are already twenty-six compressed air hauling-engines at work, on the branch roads as well as on the main roads; and it is easy to imagine the improvement that must have taken place in the underground air by the withdrawal of the ponies and horses hitherto employed in hauling. It is intended to try whether compressed air cannot be substituted for hand-labour in driving 'headings,' and in the actual digging of coal. Apart from the avoidance of the heat of steam-boilers, there is the further benefit, that explosive gases in a mine would be largely diluted by the air which escapes with each

stroke of the machinery, and is cooled by the consequent expansion.

At a recent meeting of the Philosophical Society of Manchester, a morsel of carbon was exhibited which had been formed 'on the roof of a gas retort by the decomposition of the hydrocarbon gas by heat.' In this fact there seems nothing extraordinary; but it may be found to have some relation to nature's handiwork in the formation of graphite, the mineral substance of which black-lead pencils are made. As the exhibitor remarks, the carbon deposited in the retorts 'resembles graphite in its almost metallic lustre. Graphite always occurs in association with rocks which have been subjected to igneous action, and may have been formed by hydrocarbon gases traversing fissures or dykes while the sides were in a highly heated state, thus causing a deposit similar to that formed in gas retorts. The fact that, in the latter case, an increase of pressure causes a greatly increased amount of deposit, favours this view, as it is extremely probable that the gases existing in the earth's crust would be in a state of great tension.'

A paper on Colonial Timber Trees, in the last volume of *Transactions* of the Royal Society of Victoria, makes known a few particulars which may perhaps interest others as well as colonists. The 'blackwood' is described as valuable for furniture and indoor work, for even when green it scarcely shrinks, and 'stands splendidly.' The 'red gum' yields veneers suitable for cabinet-makers; but in the solid form is used for outdoor work, and appears to be one of the most durable of Australian woods, lasting fifteen years in posts and fences. 'All the gum timbers,' says the author of the paper, 'have one strange appearance when decaying: the wood separates across the grain, as if it had been affected by fire and charred;' a phenomenon supposed to be due to extremes of climate. Of European trees, we are told that the ash, elm, and oak thrive in the colony, and are of great use. The poplar grows luxuriantly in damp situations, and yields timber 'most useful for making barrows, wagons, and all other purposes requiring a light tough wood.' The willow, walnut, and box also adapt themselves readily to the Australian climate, as do some of our pines and firs; but the resinous nature of these last-mentioned suggests danger from fire. 'To prevent this danger,' says the author, 'I would recommend the planting of belts of poplars and willows across the pine plantations. I do not think fire would pass through them; and I am of opinion that they would not readily burn, as they are generally very full of sap and moisture. And the robust kinds of *Macembyanthemum*, if planted among young trees, would completely cover the ground, prevent the growth of grass and scrub, and check the spread of fire.'

In the same volume, Mr Deverell, discussing the question of waves and their action on floating bodies, remarks, that the straining of a vessel in a seaway increases in proportion with the increase in her stability. This somewhat important distinction should not be forgotten in the general eagerness to produce stable ships. The greater the freedom with which a vessel rides on the waves, the less will she be strained by the action of their forces. 'It would perhaps be small consolation for a man,' continues Mr Deverell, 'to

know he had assured himself from the danger of being capsized by an extra liability to going straight down; and it may be fairly useful to apprehend the condition that a safe ship is one which partially opposes the waves, and partially evades them by obeying them.

Our side of the globe has talked so much of late on this question that it may perhaps consent to hear a few words more from the other side. We quote, therefore: 'It is certain that very excessive steadiness will never be attained; the magnitude of ocean waves being too great in comparison with the possible size of ships to render it feasible. A wave only ten feet in height has a breadth of never less than thirty feet, so that we may easily perceive the huge effect which the force of buoyancy of such a wave must exert in shifting from one side to another, even a vessel of fifty feet beam. The largest vessel yet constructed, the *Great Eastern*, is a notable example. She follows the waves heavily in a seaway.'

We have heard also of the enormous mechanical power which the ocean offers us, but which mechanical engineers have not yet utilised. Mr Deverell concludes his paper with a passage which has a bearing on this question. 'Let us,' he says, 'take the case of a great storm-wave forty feet in height, six hundred through at the base, and conceive a volume of water contained in the section of such a wave moving with a velocity of six feet per second, or three hundred and sixty feet per minute. Or, consider an ordinary ocean-wave, sixteen feet in height, and one hundred and eighty feet at the base; and multiply the power requisite to move a section of this body of water two hundred and forty feet per minute by a thousand such, and we may form an idea of the magnitude of the energy engaged in stirring the waters. These are the giant forces which are perpetually traversing the surface of the ocean.'

Professor Rice of Connecticut has discovered that certain deadly poisons which are violent and fatal in their effects on mammals are very feeble in their action on molluscs. Four days' soaking in dilute hydrocyanic acid did not prove fatal to the mollusc selected for the trial; and another into which urari poison had been injected, seemed none the worse when examined on the following day. Carbonic acid in large quantities produced no ill effect; but chloral hydrate and cyanide of potassium are rapidly fatal. Quinine acts in the same way, but with less energy. Chloroform produces instantaneous contraction, and perhaps death: this latter point has, however, not yet been ascertained. As exemplifying the effect of poison on a 'low' form of organisation, and affording means of comparison, these experiments have some physiological value.

Professor Rutherford, in his lectures in the University of Edinburgh, says that the 'highest success of nations, as of individuals, is only to be attained by close and severe attention to the inexorable laws of physiology,' and that 'he who has the deepest grasp of physiology will certainly take the lead in unravelling the diseased state.' He points out further that in disease, nature makes experiments from which much may be learned. For instance, 'when a blood-vessel bursts on one side of the brain, and the opposite side of the body becomes palsied; when a part of the brain becomes disorganised, and the memory of words is lost;

when the portio dura nerve is paralysed, and the sense of taste disappears from the anterior part of the tongue; when an aneurism presses on the sympathetic nerve in the neck, and causes a change in size of the pupil of the eye on the same side; when a tumour compresses the gall-ducts, and prevents the escape of the bile, or the duct of the pancreas, and interferes with the passage of its juice into the digestive canal—how interesting and how important to the physiologist, as well as to the physician, are the results of all these experiments.' Professor Rutherford holds that a knowledge of physical science is essential to form a complete physiologist; but how is this to be super-added to the subjects of study already required of young men at college? It is gratifying, however, to know, that the rudiments, at least, of this important science of animal physiology are now being taught in schools.

America presented the potato to Europe centuries ago, and now threatens Europe with a beetle which will destroy that important plant. Consequently, Europe is seriously interested in the question, how to keep out the 'Colorado beetle?' If all be true that is reported, it is as difficult to keep them out as to keep out an epidemic; but if all concerned will use their best endeavour, the mischief may be averted. The president of the Entomological Society says, in his anniversary address: 'The Colorado potato-beetle is an enemy whose rapid advances towards the shores of the Atlantic are a menace to Europe. When once established on the seaboard, they may wing their way to vessels in port, being accustomed to fly in swarms, and may thus be borne over to found a colony in this country, irrespective of conveyance with the tubers themselves. Agricultural and Horticultural Societies should make provision for the dissemination of correct information respecting these insects; and specimens of the beetles themselves should be obtained for distribution, with the view to familiarise persons with their aspect, and to prevent their diffusion.' Some further information on the subject will be found in a late number of this *Journal*.

#### A CURIOUS POLAR BIRD.

DISCUSSIONS respecting the Arctic Expedition now in preparation have brought under notice a remarkable polar bird, which periodically leaves the extreme northern regions, and visits the south of Europe. In referring to the official papers just published concerning the expedition, a writer in the *Daily Telegraph* jocosely hints that this bird 'might perhaps tell us more about the polar regions than any other that plumes a wing. It is indeed a thousand pities that the Knot, or *Tringa Canutus* of ornithologists, could not have been invited, for lack of speech, to perch upon a chair at the meetings of the committee, especially since there is a fine specimen at the Zoological Gardens, in the Fish-house, and probably at this moment that very individual knows all about the pole. In appearance, it is between a snipe and a plover, but varies in plumage according to the season of the year. In winter, it is coloured a quiet ashen gray; in summer, its feathers assume a bright Indian red tint, although the full beauty of this change is not witnessed in confinement. The knot

is one of the best judges of climate in creation, and much quicker than a thermometer to distinguish between fine gradations of cold and heat. The sort of weather and latitude it likes best is such as England affords in April and October—bright, bracing days and nights, with sunshine and breezes, but neither of them too strong. Our winter is too harsh and unpleasant for this sagacious bird; it comes to our shores from the northward in large flocks of old and young ones, and stays until November brings the frost or fog, and then—unless the “Indian summer” be prolonged—it flies away for the Mediterranean coasts and the South, where it feeds along the sea-shores till the mornings and evenings of Algeria and Spain become no longer cool. Then—that is to say, about the end of March—vast flocks are seen returning to England, and at the same time to the Northern States in America, to Denmark, Norway, and Iceland. But they never stay—they go beyond all these countries; they fly far over Greenland and the very highest latitudes frequented by our whalers, so that while the breeding-place of all the other northern birds is known, that of the knot has never yet been reached. Nobody has taken a nest of these wandering birds, or seen one of their eggs. Naturalists can only tell that they go in summer “to the northward of all things,” in order to breed. There is force, therefore, in what the blue-book says: “We may fairly infer that the lands visited by the knot in the middle of summer are less sterile than Iceland or Greenland, or it would hardly pass over those countries, which are known to be the breeding-places of swarms of water-birds, to resort to regions worse off as regards supply of food. But the supply of food must depend chiefly on the climate. The inference necessarily is that, beyond the northern tracts already explored, there is a region which enjoys in summer a climate more genial than they possess. It would be easy to summon more instances from the same group of birds, tending to shew that beyond a zone where a rigorous winter reigns there may be a region endued with a comparatively favourable climate. If so, surely the conditions which produce such a climate will be worth investigating.” Here, then, we see a little red bird suggesting profound problems to humanity, and if we really do find a pleasant polar land at the top of the world, Captains Nares and Markham must share the honour of that discovery with the knot.

Another writer, subsequently, in the same daily paper, disputes the assertion, that ‘nobody has taken a nest of these wandering birds, or seen one of their eggs.’ He says: ‘I think this must be an error. Yarrell, on the authority of Dr Richardson, says the knot breeds in Hudson’s Bay, and down to the fifty-fifth parallel, and that they were observed by Captain Lyon breeding on Melville Peninsula; that they lay four eggs on a tuft of withered grass without forming any nest, and he describes the colour of the eggs. Morris also, in his *Nests and Eggs of British Birds*, figures and describes the eggs, and states that the drawing on his plate was taken from a specimen forwarded by J. R. de Capel Wise, Esq., of Lincoln College, Oxford. The volume from which I take this note originally belonged to the late Mr Wheelwright of Carlstad, Sweden, and in a marginal remark on the egg, he says: “Not in the least like the eggs

of the knot that I have had from Greenland and Spitzbergen, nor does this figure at all resemble that in Blasius’s, which much resembles my eggs; in colouring, they are not unlike the snipe’s.” I myself have in my cabinet four eggs, which I have always believed to be those of the knot. It is probable that one or more of these were from Mr Wheelwright’s collection, as some others of my rarer eggs are; but as I did not purchase them myself, I am not certain, and do not wish to set myself against your authority. I merely mention what has come under my notice.’

We should be glad to have some further particulars of a trustworthy nature concerning the *Tringa Canutus*.

#### THE SPIRITS OF THE WIND.

WHERE is your home, ye wanderers free?  
In what far land, across what sea?  
Live ye in some vast cavern rude,  
Some unexplored solitude?

Or dwell ye where no sound is heard,  
No voice of man, or beast, or bird?  
Had ye your strange mysterious birth  
Beyond the narrow bound of earth?

Where ye might mingle with the flight  
Of spirits from the world of light—  
Bright messengers that sometimes come  
From that dear land, the land of home.

All haunts are yours, all forms, all shades,  
O’er moorland brown, or woodland glades;  
Now toying gently with a flower,  
Then rushing on with fiercest power.

Ye ring a melancholy chime,  
In the sad pensive autumn-time,  
O’er fading flowers that once were bright,  
In the resplendent summer’s light.

And o’er the leaves with rustling sound,  
Drifting so gently to the ground,  
Singing o’er withered heaps and setc,  
A dirge for the departing year.

In softened light of summer eve,  
A gentle touch ye often leave  
Upon the weary brow of pain,  
That quiet ne’er may know again.

Round mansion hoar and gray with eld,  
Your carnival is often held,  
With hollow shriek or fearful moan,  
Anon, with sad mysterious groan.

Ye rush across the restless sea,  
In all your wild tumultuous glee;  
And stately ship and pennon fair,  
Lie buried by your fury, there.

Howe’er ye come, where’or ye go,  
Through joyous scenes or haunts of woe,  
Ye ever do His bidding still—  
Our great Creator’s sovereign will.

## SOME EARLY RECOLLECTIONS.

### FIRST PAPER.

My early recollections extend as far back as the battle of Trafalgar, when the nation was profoundly moved by the death of Nelson. News at that time travelled very slowly. The battle took place on the 21st of October 1805, but intelligence of the event did not reach London until the 6th of November, and was published in the *Times* on the morning of Thursday the 7th.\* It was, of course, several days later before news of this famous naval victory was heard of in the small country town, on the banks of the Tweed, in which I lived. The community was not very demonstrative, but on the intelligence arriving, the church bells were set aringing, and among high and low there were warm congratulations on the destruction of the French and Spanish fleet. As for us boys at the school, we were indulged with a holiday, a circumstance which helped to fix the news of the battle in my remembrance. Being at the time only five years of age, I did not quite understand the momentous consequences of the victory, nor was I capable of estimating the loss that England had sustained by the death of her greatest naval hero. I now know, as everybody knows, that the victory of Trafalgar was a turning-point in the war with Bonaparte, for it entirely deranged his plan of invasion, and turned his conquests in a new direction. Nelson deserves to be called the saviour of his country. At the time, he was acknowledged to be so. The illuminations in honour of his victory, of which we heard by rumour, were magnificent. The illumination in Edinburgh had a melancholy and notable feature. One of the streets remained in gloom and darkness, while all the others were brilliantly lit up. It was South Castle Street, in which dwelt the widow of Captain George Duff, commander of the

*Mars*, who was killed in the battle. In delicate consideration to her bereavement, the inhabitants of the street refrained from any demonstration of rejoicing, and guards were placed to prevent noise or disturbance.

Of the state of public feeling during the heat of that terrible war, people in the present day, who read of it only in history, can have no proper conception. My reminiscences on the subject bring up the picture of universal soldiering, marching to and fro of regiments, drums beating, colours flying, news of victories, and general illuminations. In London, so frequent was the call of 'Light up, light up,' which might be suddenly heard at midnight or early morning, that every family, for the sake of its own windows, kept a stock of candles and small candle-holders of tin, ready for the occasion. The nation was in a kind of frenzy. The war was not on the whole disagreeable. It was rather liked than otherwise—and that was the curious thing about it. Fears of invasion being at an end, there was a prodigious military bustle that afforded amusement and also occupation. The navy and army offered wide scope for professional advancement. Hosts of young men, and some old ones too, procured a 'pair of colours,' and were able to figure in a scarlet uniform. Then, the commissariat was a wide-spread institution. What quantities of food, clothing, accoutrements, arms and ammunition, horses, barracks, transports, and so forth had to be procured and paid for! The demand for bullock-skins, wherewith to make buff belts, was so excessive, as to suggest to a tanner the invention of splitting skins in two, by which he realised a fortune. That was only one of many such windfalls. Little wonder that the war was popular among certain classes. There was a profuse circulation of money, the bulk of it being borrowed by the nation, and only to be paid for by future generations, if ever paid at all—in point of fact, as matters go, the debt incurred will not be wiped out in five hundred years.

The picture we recall had, like all pictures, its shades as well as lights. We have spoken of the morsels of brilliant colouring. Now we touch on the

\* A fac-simile of the *Times* of Thursday, 7th November 1805, containing the official despatches concerning the battle of Trafalgar, has been recently published; it forms a most interesting historical memorial.

more sombre tints. The demand for young men to fill up the ranks abroad and maintain the home defences was enormous. Recruiting sergeants penetrated into every nook of the country, and were loyally aided in their schemes of capture by justices of peace. Magistrates, in administering the law, dismissed petty offenders from the bar on the understanding that they enlisted as soldiers, or allowed themselves to be put on board a man-of-war. The death-struggle in which the country was engaged set aside all ceremony. Fairs and public markets where young men were apt to be caught formed a favourite hunting-ground for recruits.

Throwing our mind back to 1809, we see the little town on a fair-day in spring. The street is crowded with country-people, bent on business or amusement. A peripatetic show of wild beasts, with flaunting pictures of lions and tigers, is stuck up at one end of the thoroughfare, with a well-applied hand-organ to attract customers. Along both sides of the street are stalls for the sale of finery, shoes, and gingerbread, and two wheel-of-fortune men, hackneyed in their trade, are trying to wheedle eager and unsuspecting youths out of their halfpence. In the throng, we see tokens of kindness and joviality. The country lads dressed in their best—a blue coat with yellow buttons; the lasses in white cambric gowns, ribbons, and straw bonnets. For those who live many miles apart, among the hills, it is the day of renewed acquaintanceship for the year. With laughing and ‘daffling,’ all goes on merrily; and from the kindly looks that are interchanged, we can imagine that projects are formed of united affections and life-long happiness.

Suddenly, at noon, amidst the general fervour, are heard the startling sounds of drums and fife. The crowd is in visible commotion, and a new direction is given to the feelings. The boisterous but not inharmonious sounds come from a recruiting-party, which is seen to be issuing from a public-house. Advancing in front, and personifying a military hero, is the sergeant, brilliantly decorated with ribbons, and a flashing sword in his hand. How grand he looks in his scarlet coat and his lordly strut, with that majestic sword! Clever at simulation, the party mean business. Along the street they push their way, graciously radiating smiles all around, glad to chaff with any one, and seeming to all and sundry to be the most delightful fellows in the world. All the noise, and finery, and flummery are not without effect. Youths, who, perhaps, had already a little too much in their head, are seen to join vapouringly in the procession, and need little persuasion to plunge with the party into the public-house. Never in all their lives had the poor wretches been treated with so much consideration. Flattery, promises, whisky, made them an easy prey. They took the shilling in the name of His Majesty. Sergeant Kite had them.

The scene opens with the second act. We see the procession with its military display issuing again on its round of the fair. There is now something to shew. The youths who have been enlisted have ribbons dangling from their hats, they carry swords in their hands, and so, in a semi-intoxicated and mystified state of feeling, they march on to glory. The affair is grand and exciting. But a wild shriek issues from the crowd. A

peasant girl in her draggled white dress—there having been a little rain—dashes forward, and throws her arms about the neck of one of the recruits, shrieking at the same time: ‘O Jemmy, Jemmy, dinna gang wi’ the sodgers.’ Jemmy, however, is deaf to expostulation, and the party, drums, swords, and all, sweep past on their course. To the best of my remembrance, six or seven young recruits were picked up. In less than an hour—no time to stand on technicalities—they were sworn in by a neighbouring justice, who, as in duty bound, complimented them for having so patriotically come forward to serve their king and country. So, Sergeant Kite, a clever man at his trade, carries off his prey.

There was a rapidity, a hurry, in gathering recruits, which, in the present sobered-down times, is not easy to realise. Likely young men were in a state of siege. Sergeants prowling about were constantly looking after them. A serio-comic case occurs to recollection.

In the old High Street of Edinburgh, was held, every Saturday morning, a wholesale vegetable market—a sort of Covent Garden in its way, much resorted to for supplies by green-grocers. Long rows of carts, laden with turnips and cabbages fresh from the neighbourhood, were drawn up on each side of the thoroughfare. One of these vehicles, with its stock of vegetables, was in charge of Jock Muirhead, an active and trustworthy young man from Restalrig. Jock had been several times eyed by a recruiting sergeant as quite the thing wanted, and some tempting offers as to bounty and probable advancement had at times been thrown out, but without avail. He was in a good situation. It was a pleasant variety in his occupation to come into town every Saturday with his cart, sell off its contents, and return with the money to his employer. Attachment to his mother, whom he liked to be near, formed a still stronger inducement not to listen to the sergeant’s wily persuasions. So matters went on until the occurrence of a family misfortune. The mother was prosecuted for an old debt which had been heedlessly incurred by her deceased husband—who had been somewhat of a ne’er-do-weel—and, to make a long story short, Jock resolved to take the bounty, free his mother from her heavy obligations, and go off as a soldier. Accordingly, next Saturday morning, when the sergeant was scrutinisingly going his round, he had the satisfaction of securing Jock, whose conduct was altogether admirable on the occasion. Having disposed of his load of cabbages, he returned with the price he had realised to his master, delivered to him the horse and cart, and bade him farewell. We pass over the parting scene with his poor mother, who, by the generous disposal of his bounty, was relieved of a grievous difficulty.

In the hurried way that things were done, Jock was immediately despatched by a Leith smack to Chatham. There he got a week’s drill—more could not be afforded—and being shipped off for the Peninsula, he was in presence of the enemy, with a knapsack on his back and a gun on his shoulder, within little more than three weeks from the time he had been selling cabbages at the head of the Fleshmarket Close. The detachment of young soldiers, of whom he was one, happened at the time to be peculiarly acceptable. The force with which Wellington had

followed Massena from Torres Vedras had, through various sanguinary encounters, been diminished by nine thousand men. With the addition of the new arrivals, he laid siege to the strong fortress of Ciudad Rodrigo. This was one of Wellington's most brilliant feats of arms. The siege having arrived at that point when an escalade should be attempted, men who were willing to go on the forlorn-hope were asked to step out of the ranks. With a dauntless Scottish heart to do or die, Jock stepped forward; his name being inscribed in the roll of honour and bravery. It was a daring thing to undertake; but as far as climbing was concerned, Jock was not afraid. He had many times clambered up the precipices of Arthur's Seat and Salisbury Crags. Then, as for fighting, he was not bad at that either, and would take his chance—a most soldierly resolution.

On the night of the 19th of January 1812, Jock Muirhead was ranked up in the party to effect the escalade, each with several loaded pistols in his belt, and a cutlass in his hand. A certain number carried ladders, whereon to climb to the top of the walls, which were bristling with men, ready to fire upon and pick off the assailants. Jock did not for a moment flinch. On the ladder being planted he sprung up, but was not destined to get to the top. His military career was abruptly cut short. He had got to about the third round from the top of the ladder, some of his companions before him having dropped, and in a minute more expected to be in the thick of the fight, when he received a bullet-shot in the leg. His head swam. His grasp of the ladder was relaxed. And unconsciously he fell to the ground among a heap of his fellows. The storming-party who gained the summit were too powerful to be withstood. The fortress was triumphantly carried, and the garrison made prisoners.

What, in the general havoc, came of our young hero? Was he dead or alive? There he lay—faint, sick, in an agony of thirst—until next morning, when a surgeon found in him signs of life, and had him carried to an ambulance, where he was partially restored by the administration of cordials. The wounded leg was hopelessly injured, and had to be cut off below the knee. No longer of any use to the army, the poor fellow was soon afterwards put on board a transport for England, where he got well, and was furnished with a wooden leg. With a pension of sixpence a day, he returned to Scotland to follow his old profession. Jock Muirhead had been such a short time away, that by the market-people his absence was scarcely noticed. And when, in four or five months from his departure, he made his appearance, the only thing that caused surprise and provoked sympathising inquiry was the wooden leg. The leg was a little embarrassing, but did not prevent him from getting employment from his old master, who was glad to see him back, and so without delay he resumed the business of selling his cabbages as usual at the head of the Fleshmarket Close.

Early in the war, there was a wide-spread enrolment of volunteers, who were serviceable in cultivating the military spirit, and making a good show, but were of little practical value. The volunteers were too independent. They were not under the articles of war, and could do as they liked. When any one took offence, he sent in his

gun, which was equivalent to bidding good-bye to the corps. As a child of seven years old, I remember accompanying on foot a body of volunteers to a fanciful encampment of tents, some three miles distant; the business of the day consisting for the most part of a series of frolics, which the youngsters present thought exceedingly diverting. In many of the smaller towns the volunteer system was abandoned. The real dependence was on the militia, an auxiliary force of great moment for the safety of the country, as well as in furnishing contributions of men to the line. 'As is well known, the militia regiments, which took their name from the counties in which they were raised, were recruited by a species of conscription. All able-bodied men within a certain age, high and low, were liable to be balloted for; but substitutes were accepted; so, after all, it came to be a matter of paying for substitutes—a thing of no importance to those in good circumstances, but a heavy infliction on the poor. There was one way of escaping the ballot that found favour with the rural population. It consisted in joining the local militia, a species of *landwehr*, raised in the respective counties, the men in which were called out once a year for a fortnight, to be dressed and drilled as soldiers, and who for the time being were subject to regular military discipline. The volunteers having disappeared, the 'locals' took their place, and, in their way, formed not a bad reserve, if the worst should come to the worst, which it happily never did.

The regular militia, whose appearance and discipline no way differed from what was observable in the line, were a *tour de force* on which great reliance was placed. Its only unpleasant feature was recruitment by balloting. That was distasteful, even although one might become a member of an insurance club, and for a small annual payment make sure of a substitute being provided from the general fund. In the fiercest period of the war, the pressure for substitutes grew intense. The bounty to be dispensed for one was occasionally as large, if not larger than the bounty paid by government for enlisting into the army. On a particular occasion, in the small town referred to, I knew of fifty pounds being given for a substitute. There were some interesting circumstances which impressed it on my recollection. The taking of bounties to act as substitutes, and then running off, had become a kind of trade among a dissolute and worthless class. The insurance club in the town had been so terribly plagued with specious vagabonds of this sort, that they would almost give double the money to any native who could be depended on.

A substitute was in urgent demand. Advertisements were issued. Nobody would go. Thirty pounds were offered. Forty pounds were offered. At length the offer rose to fifty. A poor man of middle age presented himself. Sandy Noble, for such was the name of this true-hearted person, was by trade a cotton-weaver. He was a widower, with a grown-up family, but they had left him to pursue their own course in life; so he was in a sense desolate. The wages realised by his peculiar species of labour had materially declined, and he was now only able to make both ends meet. Not even that. He had become responsible for a number of petty debts, caused by the long and expensive illness of his lately deceased wife. These debts hung round his neck like a millstone. The

thought of never being able to liquidate them was dreadful.

One day, as he sat on his loom, meditating on the state of his affairs, a neighbour came in to announce the intelligence that fifty pounds had just been offered for a substitute. Making no remark on this piece of news, Sandy, when alone, took a slate, and calculated that fifty pounds would clear him. His mind was instantly made up. For two days and a night he worked with desperation to finish the web he was engaged upon. Having executed his task, and settled with his employer (the father of the present writer), he walked off to the secretary of the insurance club, and coming in the nick of time, was thankfully accepted as the required substitute. The militia authorities were in a fume at the delay, and a sergeant had been despatched to bring the man who had been balloted for, otherwise he would be treated as a deserter. As the recognised substitute, Sandy, in a few quiet words, pacified the sergeant. 'Just gie me half an hour,' said he, 'and I'll be ready to gang wi' ye.' The half-hour was given, and devoted to a noble act of integrity, such as, we fear, is rarely presented in matters of this nature. With the fifty pounds in his pocket, Sandy went from one end of the town to the other, paying debt after debt as he went along—fifteen and sixpence to one, three pounds eleven and threepence to another, and so on, not leaving a single shilling undischarged. When all was over, he mounted a small bundle on the end of a stick, and, in a calm, self-satisfied mood, he trudged away with the sergeant to headquarters. The name of Sandy Noble deserves to go down in the roll of honour with that of Jock Muirhead.

The war, as we see, with its innumerable horrors, was not all bad. It evoked endurance, courage, manliness, a disposition to make a sacrifice of even life itself for the public good. To take the two obscure incidents just recorded, there was a grandeur in the honesty and disinterestedness of Jock Muirhead and Sandy Noble, that gives dignity to human nature. The very knowledge that there were two such true-hearted beings in humble life is gratifying, though, no doubt, many similar cases could be mentioned. What a pity, as I sometimes musingly consider, that Peace with its manifold blessings should be so conspicuously signalled by successive crops of idle whimsicalities and crotchets, as if people were in want of something with a due amount of agony to think about!

Excepting that there was a grudge on account of the ballot, the militia were far from unpopular. The spending of six to twelve months in a country town imparted a fine variety and liveliness to a generally dullish society. The people liked to see a regiment arrive. There were daily parades, balls, and picnics. The band played night and morning. The officers made themselves mightily agreeable with their jokes, anecdotes, and accomplishments. Hotels and lodgings were well occupied. Tradesmen flourished. Every regiment had some peculiar characteristic. Some were more grave than others. The Westminster had a strong tinge of methodism. In their ranks they had a number of stirring preachers. I recollect seeing a man in his red coat vehemently holding forth to a crowded congregation in the pulpit of a meeting-house—the scene possibly not unlike what was witnessed among the troops in the time of the Commonwealth. The red-coated preachers

certainly stirred up the religious sentiment in the town, but everything drifted back to the old condition of affairs on the departure of the corps. There was another characteristic. Some of the regiments gave encouragement to a harmless oddity, who walked in front on the march, and regularly appeared in lounging fashion at parades. Perhaps he believed himself to be a soldier, and nobody thought of undeceiving him. He was dressed in the cast-off suit of clothes of a commanding officer, with cocked-hat and feather and sword. Like an authorised court jester, he seemed to be privileged to do and say funny things for the general amusement. One of these oddities had a short leg and a long one, and his grotesquely limping gait added piquancy to his appearance. Complimentarily called 'the general,' the oddity in his puffed-up grandeur might be styled the *farceur du régiment*.

In point of morals it is customary to look with a certain degree of disfavour on military life. Such, however, was the good discipline maintained among these militia regiments, that I cannot remember anything to specially find fault with. They, on the contrary, gave an intellectual fillip to the place. Some of the officers were good artists. Others brought with them books of a superior class, about which they conversed in the houses they visited. They received London newspapers, which were prized for their original and copious news of the war, also for comments on public affairs not to be found in the timid provincial press of that day. The militia officers were still more popular in making the natives acquainted with English outdoor sports until then unknown. I first saw cricket played by officers of the Cambridgeshire militia on the green margin of the Tweed. Melodies, which few had heard of, were introduced at private evening parties. Some of these I listened to with ravished ears—one in particular, the charming air, *Cease your Funning*, which was exquisitely played on the octave flute by Carnaby, a young and accomplished officer in the Ross-shire militia. In wakeful nights, even at this long distant time, when 'a' are dead and gane, I think of Carnaby and his flute; snatching in the recollection a joy that helps to gilden the sunset of existence. w. c.

#### SHIPWRECKS.

THE wreck-chart of the British Isles for 1872—the latest issued by the Royal National Life-boat Institution—now lies before us. It consists of a well executed skeleton-map of Great Britain and Ireland, the shores of which are depicted fringed with black and red dots, scattered up and down and clustered here and there apparently without regard to mathematical regularity or geographical order. Such a map has not yet found its way into schools, nor is it likely to do so, notwithstanding that we live in the days of revised codes, compulsory education, and extra grants for 'special subjects.'

The total number of wrecks that occur in any one year on the coasts and in the seas of the United Kingdom can now be ascertained with perfect accuracy from the Register of the Board of Trade. In 1872 it amounted to 2381, representing a registered tonnage of 581,000 tons, with crews of 22,785 men and boys, and the loss of life consequent upon

these is estimated at 590. Of the 2381 ships, 1878 are known to have belonged to Great Britain and its dependencies, with British certificates of registry, 1156 of which were employed in the British coasting-trade, and 722 in the foreign and home trade. From the returns published by the Registrar-general of Seamen, we learn that on the 31st December 1873 the number of British vessels registered, exclusive of river-steamers, was 20,799, having a total tonnage of 5,473,932, and crews over 200,000; so that in the course of the year 1872 nearly fourteen in every hundred of our mercantile marine was either wholly lost or damaged by collision or other casualty. It is in evidence that the loss by total wrecks cannot be less than one million pounds sterling yearly, and by partial, half a million; making together a million and a half as the annual loss to the country from the disasters on our own coasts alone. It is interesting to compare with this summary that of previous years. From 1852, lists of wrecks have been carefully kept by the Board of Trade, and dividing the period from that year till the end of the year 1871 into four periods of five years each, we find the average number to remain pretty steady, the general average being 1415. It is gratifying further to note that, while the number of wrecks has increased with the increase of our shipping, the number of lives lost at sea has decreased, a result which must be attributed to the extension of the Life-boat Institution, and the improved apparatus at their command. During the five years from 1852 to 1856, 4148 lives were lost by shipwreck, or an average of 830; while in 1872, as we have seen, out of twice the number of wrecks, there were only 590. In 1850 the total wrecks on the coast were 681, and the total lives lost 784. There were then only 96 life-boats in the United Kingdom, and about one-half of these were unserviceable; now there are upwards of 240, all in as thorough a state of efficiency as human ingenuity and a disciplined crew can render them. In 1854, when no fewer than 1549 persons were drowned, the number saved through the aid of the life-boat was 355; while in 1872 there were 739 saved, and if ship and shore boats are included, the enormous number of 4634.

Let us now examine the chart to discover if any law as to the distribution of wrecks can be traced. It may be of importance to bear in mind that the east and west sea-boards of triangular Britain are each about 800 miles in length, including inlets; the south, 400; while that of circular Ireland extends to 1400. Of the whole number of casualties of every kind which occurred during 1872, 885 were on the east coast, 550 on the west, 276 on the south, 198 around Ireland, and 49 among the islands adjacent to Great Britain. The pictorial aid of the map will, however, convey to the mind a clearer idea of these marine disasters than it is possible to acquire from any amount of 'dry statistics.' A mere cursory glance at it is enough to shew that the east, and especially the south-east coast of England, with regard to wrecks, claims a fatal pre-eminence over every other part; that the south coast is comparatively free; the west intermediate between the other two; and that Ireland—emphatically its west sea-board—is the most exempt of all.

We will now proceed to survey the coast-line more minutely. Starting from the extreme north-

eastern point, we find a comparatively safe sea, till we reach the Ness of Fife. The wrecks on the east of Scotland are but an insignificant fraction, as compared with those of England, not exceeding sixty in all from Cape Wrath as far southward as Anstruther, and this notwithstanding the almost total absence of harbours of refuge throughout its whole length. The Firth of Forth is very fairly represented with black dots, the Bass Rock collecting a little group around itself. From this point, there is a thin but continuous line to the mouth of the Tyne. Here the stream widens, and flows on uninterruptedly as far as Flamborough Head, detached lines also beginning to appear. The low-lying Yorkshire coast from Bridlington Bay to Spurn Head shews but few wrecks, but on entering the Humber, there is an almost unbroken series. Thence southward to Lynn there is a very thin, straggling line; but along the Norfolk coast the defect is fairly made up. At Great Yarmouth there is an immense congregation of these dismal dots, which seem to disperse by degrees till near the Thames estuary, when, rallying by degrees, they assemble around the Goodwin Sands in greater numbers than ever. Along the south coast, as we have already said, the calamities are comparatively few. There is a fair group as we round Dungeness, a sprinkling off Beachy Head, a greater crowd about the Bill of Portland, and a thin streak onwards to the Eddystone. Outside the famous lighthouse, the sea is comparatively free, but inside the casualties are distressingly numerous. We have then a very safe sail till the Lizard is sighted; but here the path of disaster recommences. On the whole, however, Cornwall does not stand out so conspicuously as might be expected, considering the horrible tales one has read of wrecks and wreckers on its shores. Proceeding northward, we get among a thicker crowd than we encountered in the Channel, more especially at the mouth of the Severn, along the peninsula of Pembroke, around the Isle of Anglesea, within the estuaries of the Mersey, Dee, and Clyde. The whole line of the Hebrides shews but four dots; the Orkney and Shetland Islands between them fourteen. The Scilly Isles give ten, Lundy nine, Man twenty. On the north, east, and south-east coasts of Ireland, from Lough Swilly to Cape Clear, the chart indicates a somewhat active work of destruction, the dots clustering most thickly around the important ports of Belfast, Dublin, Waterford, and Cork; but the west coast, with all its long inlets and jagged headlands, seems to maintain an almost halcyon reign of security, seventeen wrecks in all appearing along its entire length. Such is a general description of the chart.

In addition to the physical agents which act directly in producing shipwreck, and which must be considered as more or less inevitable, there are others, again, which play a lamentable part, but for which a remedy can be easily found. Under this head may be classed unseaworthiness and overloading of vessels; deficiency of anchors, cables, and other naval equipments; ill-regulated compasses; want of good charts; and incompetency of masters. We have seen that the east coast shews a much larger proportion of wrecks than either the south or west. It is usual to attribute this to the larger number of vessels that frequent the North Sea, and the presence in it of the great sandbanks. But, after making due

allowance for these two operating causes, there remains, we think, some further explanation to be given. Looking to the width of the English and St George's Channels, as compared with that of the German Ocean, they may be said to be more densely crowded with ships. But there is a great difference in the general character of these. A very large number of the vessels that pass up and down the east coast are colliers, which, as a general rule, are ill constructed and deeply laden; while the channels swarm with steamers and large foreign-going ships. We have seen that it is not among these latter that the greater proportion of casualties arise, but among our smaller coasting craft, two-thirds of the whole number being confined to them. Now, it is just in this class of vessels that we might expect to find the deficiencies enumerated above, and it is suspected that to our system of marine insurance a large portion of the blame must be attached. Where indemnity against pecuniary loss, in the event of the wreck of the ship, is secured in this form, the owner has less inducement in looking to the skill and competency of the master, and the master in exercising the necessary watchfulness for the safety of the ship. The increasing number of collisions that arise year by year would seem to bear out this supposition. In 1857, out of a total number of 1015 wrecks, 57 were attributable to this cause; while 1872 gives 409 out of 1958. In view of all this, there is no one but must fully sympathise with Mr Plimsoll and the Board of Trade in their noble endeavours to protect the lives of our seamen by insisting upon a rigorous inquiry into the competency of the master and the condition of the ship before she puts to sea. Local currents, fogs, sand-banks, imperfect charts, are other powerful causes in producing the shipwrecks that disfigure our coast; but it is satisfactory to know that the influence of these is being greatly lessened by the more intimate knowledge we are acquiring in regard to the position and character of each. The charts and instructions to mariners now issued by the Board of Trade and Admiralty are in the highest degree reliable; and if those published by private firms were equally correct, there would be little to complain of on this score. With a trustworthy chart and a good knowledge of his craft, a watchful master will, as a rule, be able to navigate his ship in the midst of fog, through currents, keeping clear of projecting headland, sunken reef, and treacherous sand-bank. Captain Basil Hall tells us, in his *Fragments of Voyages and Travels*, on a voyage from California to Rio, the first land he beheld after leaving, on the clearing away of a fog, was the very port to which he was bound. With the compass, sextant, and chart, he was thus enabled to accomplish successfully a voyage of many thousand miles; and the same feat is performed by many of our coasting captains, who often are unable to desery land from the port of departure to that of arrival. Formerly, the want of lights, buoys, and beacons led to a considerable number of shipwrecks, but danger from this cause is gradually disappearing under the labours of the Trinity House and the Commissioners of Northern Light-houses.

Such catastrophes as the stranding of the *Royal Charter* on the Conway coast, the foundering of the *London* in the Bay of Biscay, the running down of the *Northfleet* in the English Channel, and

the loss of the *Schiller* on the Scilly Isles, startle and appal; but others, again, have their ludicrous side, and some may be even said to have served beneficial purposes. Wrecks of this sort generally take place in calm, but foggy weather, and arise mainly from an inattention to the three *Ls* of Jack's education—Lead, Latitude, and Look-out. The writer of this article resided in Orkney for twenty years, and took a note of the principal wrecks that occurred there during that period. The islands as a rule are rocky and precipitous on the west, and against the tall cliff the broad Atlantic sweeps with unbroken force—during a gale, throwing its gigantic waves not only far upward into the sky, but also for a considerable distance inland. The eastern side, again, is generally flat, one of the group, Sanday, being barely above the level of the water. With a boisterous sea all round, and with rapid tides and conflicting currents between the several islands, one would expect to hear of numerous wrecks and a corresponding loss of life; but such can hardly be said to be the case now, whatever it may have been formerly. Even those that have occurred in recent years have been within some cozy bay on the east sea-board, and during comparatively serene weather, a good proportion of them being foreign emigrant ships. The only dangerous place on the west—dangerous at least as far as shipwreck is concerned—is Hoy Sound, which is the entrance to Stromness Harbour, and which has been the scene of several melancholy disasters. This state of matters affords a striking contrast to that of former times, when, through wrecks, fortunes were sometimes made by a few of the islanders, and a living by a larger number. It is reported of one of their ministers, that while conducting public worship he prayed that the Almighty would guard over all who went down to the sea in ships, but if it was His sovereign will that there should be wrecks that winter, He would not in His mercy forget the poor island of Sanday. Magnus still continues to earn a fair penny from these ravages of the deep, but now only through the portals of a keen speculation. The wreck of a large vessel among the islands usually causes a flutter in the breasts of the merchants of Kirkwall.

It would take a separate article to narrate all the notions and traditions respecting shipwrecks that are still current among the dwellers of these northern islands. Sir Walter Scott has made good use of some in his novel of the *Pirate*, but it is gratifying to be able to write that the superstitious prejudice against rescuing a shipwrecked sailor has utterly vanished along with the genus *Snailsfoot*, who probably served to keep it alive. It is worth mention that almost all our poets and novelists, both ancient and modern, represent shipwrecks as happening on islands, and make them eventually subserve some great and useful end. Like the seeds of certain plants which are wafted by the wind from one district to another, and take root in their new home, they have been sometimes instrumental in transporting and establishing a race of new settlers much needed for the working out of the right civilisation of the race. One of the earliest shipwrecks of which we read—that of Saint Paul in the sacred narrative of the Acts of the Apostles—was the occasion of bringing healing to the governor and inhabitants of Melita, and, no

doubt, of implanting in their minds the elementary truths of the Christian faith. The Greek heroes on their return from Troy met with adventures enough, among which the perils of the deep were not the least conspicuous. It was a storm, and consequent shipwreck, that drove *Æneas* to the coast of Africa, where his own followers and the subjects of Queen *Dido* first made acquaintance, an acquaintance which years after was fated to become memorable in the annals of history. America is believed to have been colonised at an early period through shipwreck; Iceland, certainly the cradle of northern literature, by the same means from Norway in the tenth century. The enchanted isle of *Prospero*, and the solitary prison of *Crusoe*, are instances in which our great masters of fiction make use of islands as materials for the embodiment of their higher creations.

Space prevents us from doing more than attending to one or two of the more notable incidents in connection with shipwrecks in and around these northern islands. A large merchantman, during a gale, while attempting to enter *Hoy Sound*, was hurled by the waves into an immense cave which lies near the opening. The only thing visible of her afterwards was the sea strewn with the vestiges of wreck, and it was universally concluded that all on board had perished. Nearly a week afterwards—while the congregation of *Stromness* were engaged in sacramental worship—a figure suddenly appeared in their midst, pale and emaciated, and looking as if the sea had given up at least one of its dead. It was the only survivor from the wreck. For days he had subsisted upon the shell-fish adhering to the rocks, which he collected at the ebb-tide; but, at last, armed with the courage of despair, he succeeded in scaling the lofty cliffs which overhang the spacious cave. A few years ago, a Russian vessel was borne helplessly onward to the rocks at *Deerness*, and her shattered timber thrown right in the midst of the onlookers that crowded the heights above. The following case may be considered almost miraculous. The island of *Westray* is one of the largest of the group, and shares the general physical appearance of the rest, being low on its eastern side, with a rugged line of almost perpendicular rock; on the west, rising in some places to the height of one hundred and eighty feet. The portion of sea in which it lies is remarkable for the strength and variability of its currents, which sometimes baffle even the skill of the amphibious native. One fine June morning, a vessel was nearing the island. There was little or no wind, but there was a strong tide running, and the sky was obscured by mist. The sails were flapping lazily, but the ship was moving onward at the rate of six or seven miles an hour towards the middle and loftiest part of the sea-wall mentioned above, impelled by the current as directly as the loadstone mountain attracted *Sindbad* towards the cave of skulls. It so happened that a fisherman had been out fowling early that morning, and at the moment was suspended by a rope over that part of the precipice towards which the ship was moving. She was immediately hailed by him, but without response. The crew were terror-struck; they could scarce believe their eyes, when they saw a man, poised in mid-air, and shouting to them from the rock in a language of which they, being foreigners, were ignorant. By the aid of

signs, he made them understand that they had to betake themselves to the boat, and pointed to the exact spot where they were to row. It was the work of a few minutes, but not a minute too soon. Lengthening his rope, he lowered himself down, and assumed the command. The doomed ship came on, was lifted upon the breast of a swelling wave, and deposited upon a sharp-pointed cliff. Here it remained a few minutes, like a dove perched upon the top of a rock, and then fell back in a thousand pieces. Meanwhile, the crew, rescued from the very jaws of death, were steered by their skilful pilot through the floating fragments, and landed in safety in a distant bay. Neither life-boat nor rocket could have been made available in an emergency of this sort, but the intrepidity and self-possession of a simple fisherman was equal to the occasion. That admirable institution, founded by the late, and so worthily presided over by the present, Duke of Northumberland, supported as he is by the indefatigable labours of the secretary Mr Lewis, and the other officers, was not then in existence, otherwise we might have heard of the rescuer on this occasion being rewarded with their highest honour.

We have confined our attention to the consideration of wrecks that occur on our coasts, and have taken no account of those on the high seas. With regard to these, the chart gives us no information, but from other sources it is gathered that they form about two-thirds of the whole number belonging to all nations in the world. They are usually those of ships of large size; but the great marine highways are now so well known, that they are traversed every year with greater confidence and safety. The ravages of the 'devouring element'—of ships struck by lightning in the tropical seas—seemed to defy human skill, and to add the horrors of fire to those of water. Our commerce is of such world-wide extent, and involves such enormous capital, while the number of our fellow-countrymen engaged in it is so immense, that we hope neither genius nor philanthropy will slacken its efforts in devising means for the protection of seamen and the abatement of shipwrecks.

## WALTER'S WORD.

### CHAPTER XL.—A LAST APPEAL.

WHEN death is drawing nigh us, we do not blink at the truth of matters, as when we have time to toy with it; and Walter, who, though so young and strong, was yet—if he kept his word—upon life's brink, felt his own mind convinced that even if the authorisation still existed, it would not be permitted to leave the hands that held it, since those hands (he felt equally sure) were *Reginald Selwyn's*. Yet not the less on that account did it behove him to do his best to obtain it. It was a bitter humiliation to have to make application to this man once more, and the more so because to him, and him alone, he had confided that his own life was imperilled as well as that of Mr Brown; but for the latter's sake he was resolved to do so. He accordingly called at the baronet's hotel, to request another interview. The reply brought to him by the servant was, that Sir *Reginald* had not yet risen. He called again an hour afterwards, and found that he had gone out. As Walter had left a pressing message on the first

occasion, and since his own lodgings were only a few paces from the hotel, it was now evident to him that Sir Reginald intended to avoid him. He therefore sat down, and wrote a letter, in which he once more urged the immense importance of the document with which Lilian had been intrusted; stated his firm belief that it had not been lost upon the way into the town; and adjured him, if he wished to save his father-in-law from a cruel death, that he should use every effort to discover it. 'If it indeed be lost,' wrote he, 'you can certify to that effect, and your personal presence at the banker's may, even as it is, be of some avail.' He added this, in case Sir Reginald had destroyed the paper, from unwillingness to let so large a slice out of the family fortune be sacrificed, rather than with the actual intention of benefiting himself by the merchant's death; or to give him opportunity of repentance and reparation, if he had indeed contemplated so great a crime. To this letter, and not until late in the evening, a verbal answer was delivered at Walter's lodgings, to the effect that Sir Reginald had nothing to add to what he had already communicated to Mr Litton. The method and terms of this reply struck Walter as being equally suspicious; it seemed to him that the baronet was not only resolved not to commit himself to paper, but that he had purposely avoided any direct reference to the authorisation itself. Should Lilian recover, there would, therefore, be no direct evidence (except from Lotty, which was as good as none) that the document had ever been inquired for at his hands; while, if she died—the merchant and himself having fallen victims to Corrali—Sir Reginald would only have to account to his own conscience for his share in the transaction. At the same time, Walter felt that it would be useless to make public this terrible suspicion, that had not indeed sprung up in his own mind in a single night, for it had its roots in long experience, but which must seem to others of monstrous and abnormal growth.

The first thing on the morrow, agreeably to the invitation he had received, Walter once more presented himself at the English bank. Mr Gordon received him with much kindness, and he fancied that there was a smile of something like assurance on his face, as well as welcome.

'Well, sir, and have you found this authorisation?' were his first words.

'No, Mr Gordon; and I frankly tell you that I think it will not be found.'

'But who could have taken it? Of what use would it be to any human being, save to Brown himself, and this rascal Corrali, whose people would be therefore the last to have stolen it?'

'I cannot say, sir,' replied Walter gloomily; a reply that expressed the state of the case more literally than his interlocutor imagined. He could indeed make a shrewd guess of what use it might be to a certain person, but he could not say so. 'I can only repeat that it is not to be found.'

'Well, that is very unfortunate, because it would have made matters comparatively easy,' answered Mr Gordon. 'I have, however, been in communication with my partners on the matter, and they are willing, under the very exceptional circumstances of the case, to make an exceptional effort. We cannot treat, of course, with you as a principal; but if Mr Brown's son-in-law and daughter will come to us in person, prepared to make an affidavit

respecting this document, and to execute a deed guaranteeing us against the loss of the money, it shall be raised by to-morrow morning. It is most unfortunate that Mr Brown's other daughter should be ill, but we must take her acquiescence for granted.'

Mr Gordon evidently imagined that he was not only making a very generous offer, which in truth he was, but also one which would be greedily accepted by the parties concerned; and the gloom that still overshadowed Walter's face irritated him not a little.

'If such an arrangement does not come up to your ideas of what is liberal, Mr Litton,' said he sharply, 'they will differ very much from those of the commercial world, I promise you.'

'Your offer, Mr Gordon, is most liberal, most generous—I acknowledge it with all my heart; but I am doubtful if it will be of any service. Sir Reginald Selwyn told me that even should the authorisation be found, it would be a question with him whether he should make use of it. As a matter of principle, he said he objected to treat with brigands at all, except with the sword; and as for a guarantee, it is my firm impression that he will never give it.'

'Indeed, indeed,' said the banker thoughtfully. 'This is, then, a very serious business, for if Sir Reginald positively refuses to execute the deed I spoke of, we can do nothing. At the same time, I cannot think that he will venture to refuse, in the teeth of public opinion. People will not hesitate to say that he let his father-in-law be put to death, in order that—his wife being, as we conclude, co-heiress—he might inherit his money.'

'My belief is, Mr Gordon,' answered Walter gravely, 'that he will let people say what they please.'

There was a short pause, during which the banker regarded him with fixed attention.

'You have had no quarrel with Sir Reginald, I presume, sir?' inquired he presently.

'There has been no absolute quarrel, but we are certainly not on good terms. I must confess I have no good opinion of him.'

'Well, I am glad to hear that, because I hope you are judging him harshly. Go to him at once, and state the case exactly as it stands. Here are his father-in-law's bankers prepared to advance this ransom upon the guarantee of himself and Lady Selwyn, and on the understanding, that Miss Lilian Brown, on her recovery, and in case of anything going wrong with the money, will join with her sister in seeing us righted.'

'Of that I will be answerable with my life—that is, if my life were worth anything,' added Walter hastily, his thoughts mechanically recurring to the brigand camp.

'Well, certainly, your life would not be a very convertible commodity, Mr Litton,' answered the banker, smiling, 'although I am sure it is a valuable one. I hope to see more of you before you leave Palermo, and under more pleasant circumstances. Above all, I hope to see you again to-day, and accompanied by Sir Reginald and Lady Selwyn.'

Directly he understood that the baronet and Walter had quarrelled, it was obvious that Mr Gordon took a less serious view of the matter, and had little apprehension of any serious obstacle on Sir Reginald's part.

'I will do my very best, sir,' answered Walter earnestly; 'and whatever happens, I thank you from the bottom of my heart. Good-bye, Mr Gordon.'

'Nay! don't let us say "good-bye," but "good-day,"' said the banker, shaking hands with him, and accompanying him to the door. 'On Tuesday we have a little dinner-party, and if you will allow me, I will send you a card of invitation to your lodgings.'

A card of invitation for Tuesday! Never, perhaps, did such a simple act of courtesy awaken such bitter thoughts as those which filled Walter's mind as he took his way home through the crowded streets. All about him was full of light and life, but upon his inmost heart the shadow of death had already fallen. His firm conviction was, that his fate was sealed, and that no Tuesday would ever dawn upon him in this world. He could do his best with Sir Reginald, of course though his best should include no word of appeal upon his own account; if his own life alone had been in peril, he would not have stooped to ask it of him at all—but he had an overwhelming presentiment that his visit would be fruitless.

At the hotel door, he was met, as usual, by the statement that Sir Reginald was not within.

'It is no matter; I will go in and wait for him,' was Walter's quiet rejoinder; and there was a determination in his tone which it was not in Sicilian nature—or, at all events, in the nature of a Sicilian hotel porter—to resist. He walked upstairs, and entered the sitting-room of the baronet without announcement.

Lotty was seated there alone, and thinking, no doubt, that it was her husband, she did not even look up from her employment. Her back was turned towards him, and she was engaged, or appeared to be so, upon some sort of needle-work, but he noticed that she passed her handkerchief rapidly across her eyes, as he entered the room.

'Lady Selwyn,' said he, 'forgive this intrusion, but my business admits of no delay.'

She sprang to her feet, and faced him with a frightened look.

'Oh, Mr Litton, does Reginald know?'—She hesitated, and he could see she trembled in every limb.

'That I am here?' answered Walter quietly. 'No; he does not know it, but it is necessary he should do so. I am come on the gravest errand, and one on which hangs your father's life.'

'O sir, you must be mistaken,' replied she, her eyes filling with tears; 'it cannot be so bad as that. Reginald assures me that it cannot.'

'Your husband cannot know the facts, Lady Selwyn, as I know them. To-morrow will be your father's last day on earth, unless one of two things happens. One is, that the authorisation which your sister brought with her from the brigands' camp into this house, shall be forthcoming.'

'I cannot find it; I have searched everywhere; indeed, indeed, I have,' returned she earnestly.

'Perhaps Sir Reginald could find it, if he tried.'

Lotty's pale face assumed an awful whiteness, and her teeth began to chatter as though with cold.

'No, Mr Litton, he cannot,' she gasped. 'It is lost, lost, lost!'

'You mean, that I am too late,' said Walter sternly—'that it has been destroyed.'

'I don't say that, I don't say that!' cried Lady Selwyn passionately. 'I did not see him do it; but yet, in ignorance of its importance, he may have done it. What was the other hope—the other chance? O help me, help me, Mr Litton, to save my father!'

'The other hope—and the only other hope—lies in yourself.'

'In me!' exclaimed she joyfully; 'then he is saved.'

'In you, and in your husband.' The light faded from her eyes in a moment, and she uttered a deep sigh. 'Yes; you and he have only to present yourselves at the English bank this day, and execute a certain deed, and the ransom will be paid.'

'I will ask him, Mr Litton; I will beseech him; but you know' (here she smiled a wretched smile) 'that I have not much power; and he is so convinced—being a soldier, you see, himself—that the better way is to send the troops. Perhaps—he will be very angry, I am afraid, to find you here—but still, perhaps you will not mind seeing him yourself.'

'I shall most certainly see him myself, Lady Selwyn.'

'And do not give him an opportunity for a quarrel,' continued Lotty earnestly; 'for my father's sake, and for Lilian's, be careful of that. Bear with him, Mr Litton.'

'I will endeavour to do so,' answered Walter gravely. Her advice was good so far as it went; for it was likely enough that Sir Reginald would endeavour to escape what was required of him, by means of a quarrel; but, then, was it not still more probable that he would contrive to quarrel in any case?

'How is Lilian?' inquired Walter. 'You may imagine the pressing importance of my visit here, since I have not put that question before. The porter in the hall, however, informed me that she is much the same.'

'No; she is better,' said Lotty, dropping her voice, and looking cautiously round; 'I can give you that much comfort. She is herself again—quite herself—though, of course, as weak as a child.'

'Ah! if it were ten days hence, instead of to-morrow—to-morrow!' murmured Walter involuntarily.

'Why so, Mr Litton?'

'Because Lilian herself could have then gone to the banker's; but at present that would, of course, be out of the question.'

'O yes, quite. In three days' time, however, I think she would be strong enough to see you—and I am sure it would please her.'

'In three days' time! This woman had already, then, forgotten,' thought he, 'the fate that awaited her father within less than forty-eight hours. What a weak and wavering nature was hers, how impressible, and yet how easily every impression was effaced! How could it have been possible that there had been a time—and not so long ago—when he had thought of her as one of the noblest of womankind! How different, and how inferior was she to his Lilian!'

This was somewhat hard on Lotty, for she had not forgotten what Walter had told her respecting her father, only she did not think matters were quite so bad as he described. She believed him

more than she believed her husband, but it was natural that she should believe the latter a little—not that she did not know him to be untruthful, but because she was loath to think of him so ill, as it would be necessary to do, if Walter were right in his forebodings. She had also the tendency of her sex, to think all risks much less than they were represented to be.

'I suppose,' said Walter, not without a tremulousness in his tone, 'that it would not be possible for me to see Lillian, either to-day or to-morrow morning, even for a few minutes?' It seemed so hard to go to death without bidding her good-bye, though he knew it would cost him so much; as for her, it would cost her nothing in that respect, since it would be dangerous, as well as useless, to tell her how matters really stood.

'Well, you might see *her*,' said Lotty, hesitating; 'but I could hardly promise that she could see *you*. Perhaps the day after to-morrow, when she has had her afternoon sleep, and is at her best, she might bear the interview. She has often spoken of you, and even asked for you, though sometimes I doubted whether she knew what she was saying; and considering what you have undergone together, I cannot think there can be any harm—and Reginald has said nothing against it—yes; I really do think we might say the day after to-morrow.'

It was almost a relief to Walter, finding poor Lotty what she was, to hear Sir Reginald's stern voice in the hall (doubtless rebuking the porter for having given his visitor admittance), and to feel that from him he would at least definitely know his fate. It was easy to see by Lady Selwyn's face that she heard it also.

'Shall I go, Mr Litton,' murmured she hurriedly, 'or shall I stay? If you think I can be of any use'—It was evident enough which alternative the poor lady preferred, and Walter was disinclined to put her to pain; moreover, it was as likely that the presence of a witness would harden Sir Reginald in his villainy—if villainy he intended to commit—as that it would shame him into propriety; and again, if the baronet proved obstinate, Walter would be compelled, for her sake, to mitigate the indignation and contempt which in that case he was fully resolved to express towards him.

'It is just as well I should see your husband alone, Lady Selwyn,' said he gently; and Lotty disappeared through one door, as Sir Reginald presented himself at the other. 'It seems to me, Mr Litton, that you are very importunate,' were his first words, as he closed the door carefully behind him. Neither the action nor the unaccustomed pallor of the baronet's face escaped his visitor. They were evidences to him that this man had made up his mind upon the matter in hand, but at the same time was ashamed of his resolution, or, at all events, was well aware that disgrace would be imputed to him.

'Where two men's lives are in such imminent peril, Sir Reginald, I do not think that any endeavour to save them should be termed importunity. The authorisation intrusted to your sister-in-law's hands has, it seems, been lost.'

'You have already had your answer upon that point,' replied the other coldly. 'As to its being lost,' indeed, I cannot say, because that supposes such a document to have been in existence; but, all events, it has not been found.'

'And I conclude, Sir Reginald, I may take it for granted that it will not be found?'

'I do not understand you, Mr Litton.'

But it was plain by the red spot on his cheek-bones, and the hard glitter of his eyes, that he was well aware of what was meant.

'We are quite alone, Sir Reginald,' said Walter in firm significant tones, 'and there is no reason why I should not speak plainly. The loss of this document, I must needs remind you, which includes also the sacrifice of your father-in-law's life, would be to you a great gain. It behoves you, therefore, for your reputation's sake, if for no better reason, to—'

'My reputation, sir,' interrupted Sir Reginald contemptuously, 'can stand any slur which Mr Walter Litton may choose to cast upon it.'

'I do not speak of myself; I am merely quoting the opinion of Mr Gordon, the banker here, which will, I am sure, be shared by every one of our countrymen in this place, that if you refuse to assist in rescuing Mr Brown from the cruel hands which threaten him, your conduct will be open to the gravest suspicions. The money which it is well known you would inherit by such a course of proceeding, would doubtless be a consideration—but it would be blood-money.'

Sir Reginald was trembling with rage in every limb, but yet he restrained himself, as Walter knew he could never have done, had he been imputing to him less than the truth. 'It is certainly very agreeable, Mr Litton,' said he in a hoarse voice, 'to find that others, beside yourself, are interesting themselves so much in my private affairs; but it is just as well—if they are to be made public—that the facts should be thoroughly understood. You accuse me of concealing, or destroying—for it comes to that—a certain document, the very existence of which I do not hesitate to deny. It is true my sister-in-law has mentioned the very sum you speak of—the monstrous amount of which, by-the-by, seemed well to consort with her unhappy condition—but as to seeing it stated in black and white, that, nobody has done. Yet, because I don't produce it, you go about the town, it seems, accusing me of refusing to assist my father-in-law in obtaining his freedom. I have done my best—and in accordance with the judgment of those best fitted to advise in such matters—by getting the troops sent out, and I am prepared to do aught else—short of what is utterly unreasonable—to further the same end.'

'In that case, then, Sir Reginald,' said Walter gravely, 'my object in coming here to-day is accomplished. I am commissioned by Mr Gordon to inform you, that if you and Lady Selwyn will present yourselves in person at the bank to-day, your guarantees for the money will be accepted in place of the authorisation, and that in that case Mr Brown's ransom will be forthcoming at once.'

'What! the three hundred thousand ducats?'

For the moment, astonishment had dulled Sir Reginald's wits; instead of being ready with an excuse for not conforming to this unexpected offer, he could only oppose an incredulity which the facts must needs overcome. The idea of his personal guarantee being accepted for such a sum as fifty thousand pounds—one hundredth part of which in ready-money he had rarely possessed in his life—had utterly overwhelmed him.

Walter began to think that his own difficulties

were over, and ventured to smooth away those which seemed to present themselves to Sir Reginald.

'Your guarantee,' said he, 'it is true will be but a matter of form. When Mr Brown regains his liberty, he will, of course, be glad enough to pay the money; only, in the absence of the authorisation, the bank needs to be assured of this, by his daughter and yourself.'

'But if he does not regain his liberty, and the money is taken by the brigands all the same?' observed the baronet. 'Supposing even they were to kill him—as you have told me is possible—and these three hundred thousand ducats go into Corrali's pockets all the same?'

'That is to the last degree improbable; such a breach of faith has never been known among these people.'

'Impossible! But is it impossible? that is the question. As to honour among thieves, to be sure there is a proverb to that effect, but it would scarcely justify me, I should imagine, in putting such a temptation as fifty thousand pounds in the way of a Sicilian brigand. No, Mr Litton; I am sensible—you may tell Mr Gordon—of the compliment he pays me; but I must decline to accept such a responsibility—to undertake an obligation which I have no means of discharging—should things turn out amiss—as a man of honour.'

'I must again remind you that we are quite alone, Sir Reginald,' said Walter bitterly, 'and that I know you perfectly well. You have undertaken obligations before now which you had much less chance of discharging than this one, and with much less important objects. Your scruples upon this matter, when I saw you last, and when no such opportunity as the present offered itself, were confined to making overtures to the brigands at all, who, you said, must be treated with, on principle, by the sword alone. Those scruples, it seems, you have forgotten; but you have found others more adapted for the new conditions. I do not doubt that in any case you would find reasons enough to excuse you from following the course which duty and humanity alike point out to you. As for me—if you persist in this wickedness—I shall be a dead man to-morrow night; but do not imagine that I shall die unavenged. I will leave behind me a statement of your conduct, in this matter, towards your relative, which, so soon as the news comes of our double murder, shall be published far and wide. You will be rich, perhaps, for it is possible—I have no doubt you are speculating upon her illness turning out fatally even now—that you may obtain poor Lilian's inheritance as well as that of your wife; but you will never purchase, I do not say the respect, but the recognition of your fellow-creatures. You will be held as a man accursed. That you are brave—in one sense, at all events—I am well aware; but you will not be brave enough to hold up your head when the finger of public scorn is pointed at it!'

'Have you done—have you quite done?' inquired Sir Reginald coldly. 'Have you any more theatrical effects with which to favour me?'

'I have nothing more to say, Reginald Selwyn, except to put the question for the last time: Will you stir a finger to save your father-in-law's life, or will you not?'

'If you mean, by stirring a finger, will I become a party to a negotiation with brigands?—no; I will not!'

'Mr Gordon was right,' said Walter bitterly, as he rose from his chair. 'There was a time when Reginald Selwyn was a gentleman and a soldier; but I know him now for what, in his cruel heart, he knows himself to be, a scoundrel and an assassin!'

Sir Reginald leaped to his feet, but the passion which, in the days that Walter had referred to, would have prompted him to strike his adversary to the earth, gave way immediately to calculations of prudence. He reflected that a conflict with his quondam friend at such a time would be most damaging to his interests and reputation. Walter waited quietly for the expected assault—in truth, he desired nothing better than to grapple with his enemy, with little solicitude for what might be the result of such an encounter; but perceiving that it was not to happen, uttered but one word, 'Coward!' and looking steadily in the other's face, turned on his heel, and left the room.

#### CHAPTER XLII.—WALTER SETS HIS HOUSE IN ORDER.

A great poetess has described for us the aspects under which death appears to man in his various ages; but the welcome which but too many of us are ready to give it, she has forborne to sing. There are many thousands in this little land of ours, I do not doubt, who would receive with joy a summons to eternal peace, if it were only to be cessation from trouble, and nothing more. Only to rest, and to be out of the world, is their piteous desire. It is probable that the establishment of life-assurance societies has prolonged human existence more than all the appliances of science before and since their era. There is many a man for whom not only Prosperity and Pleasure are over, but even Hope itself, who feels not only old age, and poverty and care, growing over him like mosses upon a wall though, alas, not so painlessly—but comfortless despair; there is many a man, I say, who, if himself were alone concerned in the matter, would certainly end all with a bare bodkin, without much fear of the after-dream. It is true, indeed, that what we fear is worse than what we feel; but the feeling is, in this case, sharp and sensible, while the fear is vague and shadowy. With what bitter but secret smiles do church-going men often listen to homilies about the joys of life, and the eager clutch with which humanity clings to it! Still, doubtless, on the whole, the poet is right; to most men—let us thank God for it—life is dear. To youth, it is especially so, for to them even, if it may sometimes seem that it would be well to die, the Preacher's words are true, that heaviness may endure for a night, but joy cometh in the morning. Thus, as we have seen, it had lately appeared to Walter Litton that existence had no great boon to offer him, and that he might let go his hold upon it without much regret; but now that he was standing in the shining street, with the sea one smile before him, and the voices and laughter of his fellow-men breaking in upon his ear, it again seemed hard to die. He was not yet three-and-twenty, and in perfect health and vigour; the slight hurt that his few days of scarcity and exposure upon the mountains had done him, or, perhaps, had only seemed to do him, was quite passed away. There was no reason—save that terrible bail-bond of his word he had

given to the brigand chief, and which was to be exacted on the morrow—why he should not live for the next fifty years; breathe the soft air, feel the warm sun, gaze into the pure depths of yonder sky, and eat and drink and be merry with his fellows. If only that little promise of his could be blotted from his mind—and only from his own mind, for no one else would reproach him for breaking it—he felt that his life might be a happy one. Should Lilian recover, of which there now seemed to be good hope, she would undoubtedly accept him for her husband, in spite of any representations of Sir Reginald. To have love, riches, health, and youth within his power, and yet to exchange all to-morrow - to-morrow—for a cruel and lingering death, was a terrible thought indeed.

The contrast did not, however, present itself in the form of a temptation. He did not need to picture to himself the disappointment of the unhappy old merchant at his non-appearance in the brigand camp, nor the mortification of Joanna at that evidence of his want of faith; indeed, they would both, he knew, be glad that he had thus escaped his doom, since it was to be escaped no other way; nor did the thought of the bitter triumph of Corrali over his broken word affect him in the least, for it never entered into his mind to break his word. He was going back on the morrow to his death, as he had always intended to do, should things turn out as they had done; but he had not expected them so to turn out; and his disappointment was very bitter, and his regrets very keen. He had no sense of any heroism in his own conduct, but only of the hardness of the fate that necessitated it; and he was furious against the selfish and murderous greed of Sir Reginald. If religion required of him, in that hour of wretchedness, to forgive the man, who, if not the actual cause of it, had, by his criminal inaction, conduced to it, Walter was not religious; he hated and despised him infinitely more than Corrali himself, and in all the dark turmoil of his thoughts, kept this one clear and distinct before him—that so far as in him lay, Reginald Selwyn should not escape unpunished. There are many good and wise axioms that require to be acted upon with a difference, according to the character of those with whom we have to deal. A soft answer, we are told, for example, turneth away wrath; and it doubtless does so in many cases; but there are others in which conciliation is not only thrown away, but increases the fury of the wicked man, since he conceives from it that he may be furious with impunity. Another excellent precept is, to leave evil-doers to the punishment of their own conscience; but here also it is necessary to be convinced that in the particular case such an instrument of chastisement exists. To have left Reginald Selwyn to the stings of remorse, would have been much the same as to have inflicted a fine of five shillings upon a millionaire for murder. Walter was firmly resolved to inflict no fine upon him, but such a penalty as he must needs feel. He therefore made use of one of the few hours of life remaining to him to draw up a detailed statement of the facts of Mr Christopher Brown's capture and imprisonment, with especial reference to the ransom which would have procured his release; the mysterious disappearance of the authorisation, and Sir Reginald's lukewarmness concerning it; the negotiations with the banker, and the baronet's

refusal to sign the guarantee: nor did he hesitate to point out how, by such a course of conduct, the latter's material interests had been advantaged at the expense of his unhappy relative. This paper he sealed up, and addressed to the British consul, with a request that it might be made public so soon as the fatal news from Corrali's camp should reach the city. Of himself, he said little, beyond describing the circumstances of his compelled return to the brigands, which would naturally afford to his statement the weight which attaches to the evidence of a dying man.

A much more painful, if less important task then claimed his attention, in bidding farewell to Lilian. It was necessary to do this in writing, since, even if he should have the chance of seeing her (which now seemed improbable), it would have been impossible, in her fragile condition, to communicate to her the true state of the case. He did not waste many words upon Sir Reginald, with whose character he knew Lilian was well acquainted, and of whose conduct in the present matter she would hear the particulars from other sources; but he solemnly laid the fate of her father and himself at the baronet's door, and adjured her to rescue Lotty from his hands, which, as he pointed out, it would be easy to do by making some pecuniary sacrifice. 'He has no wish, you will find,' he bitterly added, 'to keep his captive for her own sake; but in his willingness to accept ransom, you will find him the counterpart of Corrali himself.' Finally, he asked Lilian's pardon for the involuntary share he had himself taken in the marriage of her sister with the man who had thus brought ruin on them all. The rest of his letter described the steady growth of his affection for herself, which, although all hope of its fruition seemed denied to him, had induced him to come abroad, in the hope of being of use to her, under circumstances which had given her just cause for apprehension. Unhappily, his efforts to assist her had been unavailing, but he besought her to believe that he in no way regretted them; he had done his best, and failed; but to have done less than his best would have been a greater pain to him than his failure was. Then he spoke of their common youth, and entreated her not to grieve unreasonably, or for long, over his decease. Fate had only permitted them, within the last few days, to express to one another their mutual love; if he had lived, it was true, it would have lasted as long as life itself; but since he was doomed to die, it was contrary to nature and reason that her young love should be wasted on a dead man. He gave her his full leave—'Such a permission,' wrote he, 'will seem preposterous to any other than yourself, but you will feel that I have the right to give it; and I foresee that it will one day be a relief to you—to marry whom she would. And he wished her happiness in her wedded life. Walter felt that his letter was egotistic; but also that she would make allowance—then and always—for the circumstances under which it was composed. The *Ego* was strong within him. As he looked out from his window, earth, sea, and sky seemed to have the same personal reference to himself that they have to dying men. He saw them now, but after one day more he would never see them. The sun was setting, so far as he was concerned, for the last time save one. The mighty world, so full of light and life, would go on as usual, but not for

him; he was about to drop out of it, and the darkness of the grave to close around him. After that, he knew not what would happen to him, nor did any man know. He could only bow his head in reverent faith. He was not afraid of falling into the hands of God, nor did he repine in an unmanly manner. But as he thought of Lilian, and of all that might have been, but which was not to be, the tears gathered in his eyes. His mind, too, wandered back to Beech Street and faithful Jack Pelter. He did not feel equal to writing to him, but he would learn all that had taken place, and he could trust him to construe all aright, so far as he was himself concerned. By his will, made when he came of age, by his lawyer's advice, he had left him—the only friend who had at that time 'shewn himself friendly'—what property he was possessed of; and it was a comfort to him now to think that, notwithstanding his feckless habits, poor Jack would never want. He had put aside some portion of his ready-money to pay for his own interment in the English cemetery (a favourite spot with him), should his body be recovered from the brigands; and the rest he had allotted to Francisco, as the marriage portion of his bride. These, with the letters, he intended to leave out upon the morrow, in order that they might be found after he had left the city. And now all matters having been thus provided for in this world, he was sitting at his open window thinking unutterable things.

'Signor!'—he started, so deep he was in meditation that he had not heard any one enter his apartment—'signor, I have news for you.'

It was Francisco's voice, the tones of which were always musical, but which had acquired of late—born of his new-found love—the tenderness of a brook in June, 'which to the leafy woods all night singeth a quiet tune;' his passion had rendered him sympathetic, as well as eloquent. 'You have scarcely touched your dinner, my father says; but you will eat supper when you have heard my tidings. The English young lady is better, still weak and worn, poor soul, and a mere shadow to look at: you must not be frightened at that.'

'What! can she see me, then?'

'Yes; she will see you: not to-night, because it is too late, but to-morrow.'

'To-morrow!' The very word seemed to sound forlorn and sad, as he uttered it. 'It will be early, then, I hope, Francisco.'

'Yes; it will be very early. After her night's rest, says Julia, her mistress is at her best and strongest, and she wishes to see you, signor, ah, so eagerly!'

'A thousand thanks, Francisco. You will find that I have not forgotten this good service.'

'Oh, do not speak of that. But you must really eat something, none would think that it was but two days ago that you came back half-starved from the mountains.'

A sharp pang ran through Walter's frame; he had been reminded of a thing forgotten—namely, his appointment with Santoro for that evening.

'Come, signor, let me bring you supper.'

'Presently, Francisco—in half an hour or so; I have something to do first in the town.' He turned back to the window, unwilling to prolong this talk; and Francisco, with an anxious glance at his English friend, and a dubious shake of his fine head, withdrew from the apartment. Immediately

afterwards, Walter took up his hat, and repaired to the usual rendezvous, where he found Santoro awaiting him. He at once informed the brigand that all hope of obtaining the ransom was at an end, and inquired at what hour it would be necessary to start upon the morrow.

'We should be off before noon,' was his quiet reply, 'since it takes much longer to climb a mountain than to descend from it.'

'Then I will be here before that hour.'

'Hush! Not here, signor, but at the end of the Marina,' answered the brigand in low tones. 'This place is growing too hot for me; certain inquiries have been made, I find, and it is necessary that I should leave the town to-night.'

'You do not suppose, I hope, that it is through anything I have said—'

'No, no; the signor is a man of honour; but he has been watched and followed. A brigand's eyes never deceive him.'

Walter could not but think that his companion was mistaken, for not only had he been unconscious of any such espionage, but he knew of none who could have any interest in his coming and going. Still, it was obvious that Santoro was uneasy, and since it was unnecessary to prolong the interview, they parted at once. As Walter went back to his lodgings, he cast a glance up to the rooms which the Selwyns occupied at the hotel, and saw Sir Reginald smoking and sipping coffee on the balcony; and as he was the only man who was likely to take any note of his proceedings, the brigand's suspicion seemed to him more baseless even than before. Walter's supper was brought up to him by Baccari himself, and not, as he had expected, by Francisco, and the good lodging-house keeper was unusually silent. His guest was content, however, to observe the change without making allusion to it, since, to be left alone with his own thoughts, was, on that night which was to be his last on earth, what he most desired.

## ABOUT FUNGI.

It is not to be wondered at that the difficulties attending the study of cryptogamic botany should have made it less attractive than the study of the flowers of the field. It is to be regretted, however, that prejudice should have so long stood in the way of progress in one department of this most interesting branch of botanical research. Ferns, mosses, and sea-weeds have each in their turn had a share of popular esteem. Fungi, or rather toad-stools—for the common notion of fungi scarcely goes beyond these—have generally been regarded with contempt. Yet there is perhaps no more interesting field of study in the vegetable kingdom than they afford, whether we look to the marvellous beauty of form or of colouring which they present both to the naked eye and to microscopical investigation. With the microscope, the study of them becomes truly fascinating. A volume on Fungi has recently been published in the International Scientific Series (*Fungi, their Nature, Influence, and Uses*, by M. C. Cooke, M.A., LL.D.; edited by the Rev. M. J. Berkeley, M.A.,

F.L.S.), which, it is hoped, will awaken a wider interest in the subject.

It is popularly supposed that fungi are to be found associated only with decay; and until within a comparatively recent period it was not unfrequently asserted that they could not grow on healthy substances. 'It is, however, now a well-established fact,' says Berkeley, in his *Outlines of British Fungology*, 'that the most healthy tissues may be affected by fungi, though they rapidly become diseased under their influence.' While it is true that they are to be found in the most noisome places, on dunghills, in damp cellars, or in pestilential drains, it would be a great error to identify them with such places. They love chiefly shady woods, grassy glades, leafy dens, and open pastures. They are to be found wherever there is decaying vegetable substance, while large numbers establish themselves on the tissue of living leaves. Some grow on animal substances, such as leather, horn, and bone. Particular insects are liable to be attacked by them. One species in the West Indies is developed on a wasp, which flies about with its burden till it becomes greater than it can bear; and in a well-known disease to which silkworms are liable, a true fungus plays its part in the work of destruction.

While some fungi are among the most minute products of the vegetable kingdom, others attain an enormous size. Mr Berkeley mentions an instance which occurred in the north of England, where the sandstone walls of a railway tunnel were covered by a vast curtain of fungoid growth. The larger and more fleshy fungi are of rapid growth, and, in consequence of the rapid development of their cellular tissue, they possess an expansive power, of which curious, apparently incredible instances are on record. One of the most interesting of these is given on the authority of Dr Carpenter: A pavement stone measuring twenty-two inches by twenty-one, and weighing eighty-three pounds, though secured by mortar, was completely lifted out of its bed by the growth of large toad-stools beneath it. Rapid in growth, fungi also speedily decay. 'Some species,' says Berkeley, in his *Introduction to Cryptogamic Botany*, 'are capable of exhibiting every phase of growth and of decay in a few hours.'

The colour of fungi depends for the most part upon the contents of the cells, and these are endless in variety. The one colour remarkable for its absence is pure vegetable green (*chlorophyll*); and this, according to the opinion of Mr Berkeley, is probably due to the fact that, like animals, they exhale carbonic acid, and absorb oxygen. When green does occur it is of a dull metallic hue. It is worthy of note that one of these greens is of practical use in art. The most careless observer may have noticed how common it is to find pieces of rotten stick deeply stained with a beautiful green tint. This is the *mycelium*, or spawn of a fungus (*Helotium aeruginosum*); and the wood so stained is used for its colour in the manufacture

of Tunbridge ware. In variety and beauty of colouring, fungi may be truly said to rival the flowers of the field. Associated as they have been in the popular mind only with decay, the common error, that they are disgusting in smell, is not to be wondered at. Some, undoubtedly, are extremely fetid; but many are sweet-scented, such as of newly-mown hay, violets, anise, myrrh, and apricot.

No class of plants presents a greater variety or stranger diversity of forms. To those who love to wander in the woods or green fields in summer and in early autumn, the appearance of some of the larger and more noticeable species must be familiar. The brilliancy of their colouring can scarcely fail to attract attention. The Agarics, of which the common Mushroom (*Agaricus campestris*) may be taken as the type, are the best known, from their parasol shape. The most attractive of these is the splendid Fly Agaric (*Agaricus muscarius*), found chiefly in fir-woods. With its bright scarlet pileus, studded with white warts, and its pure white gills and stem, it forms a very striking object. Of all the true Agarics, it is the most dangerous. It has been used as a fly-poison; hence its name. It is used and highly prized by the inhabitants of Siberia for its intoxicating properties. Its first effect when eaten is exhilarating; and it has the curious power of producing erroneous impressions of size and distance. Under its influence, a running leap would be necessary to clear a straw lying upon the road. If it is taken in sufficient quantity, intoxication passes into delirium, which is succeeded by entire loss of consciousness and death. There are some genera of great beauty allied to the true Agarics, such as the *Hygrophori*, from their peculiarly waxy appearance and brilliancy of colour; the *Lactarii*, or milky Agarics, so called from the milk with which they abound, and which drops from them when they are injured; and the *Russula*, which resemble the *Lactarii*, but are destitute of milk. One of the most beautiful of the latter genus, the Emetic Agaric (*Russula emetica*), with its smooth shining red pileus, and white gills and stem, is also one of the most dangerous. A very small portion of it would serve to produce the most disagreeable effects, such as are indicated by its name. Of other genera, perhaps the most beautiful in form are the various species of *Clavaria*. Some of these are so delicately branched as to resemble the most exquisite coral. Their prevailing colours are pure white and full golden yellow. One is of pure amethyst. There are few sensations of delight keener than those which the mycologist experiences in coming upon groups of these exquisitely coloured plants, while wandering through an ancestral park, or in the green woods at early morning, when the dew is yet fresh upon the grass, and the birds are singing upon the trees, and the world of toil is asleep. Very beautiful also are the forms which even the lower powers of the microscope reveal. In the various species of mould, for example, we find miniature forests of wonderful beauty and delicacy. It is beyond our purpose, however, to do more than recommend the study, and we almost envy the first surprise and delight of one to whom microscopical investigation is entirely new.

In speaking of the uses of fungi, we must limit ourselves to their edible properties. Much useful and interesting information on this subject will be found in the volume to which we have already referred; in Mr Cooke's *Plain and Easy Account of British Fungi*; and in Dr Badham's *Treatise on the Esculent Funguses of Great Britain*. Great assistance will be derived also from two sheets published by Mr Worthington Smith (London, Hardwicke), containing admirable coloured figures of the more common esculent and poisonous species.

In all parts of the world, fungi have been employed as food. The Parisian epicure and the savage of Tierra del Fuego alike value them. In our own country, with the exception of the common mushroom, they have never been highly esteemed, doubtless from dread of dangerous species. Yet there are many unmistakable species which are sufficiently common to be useful, while some are justly esteemed as great delicacies. At least fifty or sixty species are capable of supplying wholesome and nutritious food. More unmistakable even than our common mushroom are the Orange Milk *Lactarius* (*Lactarius deliciosus*), the only one of the genus which has milk so coloured; the Chantarelle (*Cantharellus cibarius*), with its rich golden colour and apricot scent; and the fairy ring Champignon (*Marasmius oreales*). Yet these, though common, are scarcely eaten in this country. They are perhaps the finest of all our edible fungi, excelling the common mushroom, and are highly esteemed in nearly every country in Europe. *Boletus edulis*, belonging to an order (*Potyporei*) in which we find tubes or pores in place of the gill-plates of the Agarics, though inferior to those just named, is commonly used throughout Europe. It is easily distinguished by its brownish smooth cushion-like pileus, its greenish yellow tubes, and its thick reticulated or netted stem. Yet this species, though common in our woods, has never been much used in Britain, probably because the genus *Boletus* contains several which are decidedly dangerous. Dr Badham supposes that this is the *suillus* which was eaten by the ancient Romans. Another species, belonging to the same order, must not be omitted, *Fistulina hepatica*, so named from its resemblance to liver. A slice of it is not unlike beef-steak. It is usually found on the trunks of old oaks, and is much more common in England than in Scotland. Mr Cooke, in his *British Fungi*, states that 'specimens are now and then met with which would furnish four or five men with a good dinner; and they have been collected weighing as much as thirty pounds.' In another order (*Hydnei*) we find the under surface of the pileus beset with spines instead of gill plates or pores. One of these, which is common in our woods (*Hydnum repandum*) is much esteemed in some parts of Europe. The *Hydnum* generally are said to resemble oysters in flavour. Many others might be named which, however, are scarcely so common as to merit the attention of the mycophagist.

It is scarcely possible to give any general rules by which esculent may be distinguished from poisonous species. They can be discriminated only by the study of species. 'The only safe guide,' says Mr Cooke, in his recent work, 'lies in mastering, one by one, the specific distinctions, and increasing the number of one's own esculents gradually, by dint of knowledge and experience, even as a child learns to distinguish a

filbert from an acorn, or, with wider experience, will thrust in his mouth a leaf of *Oxalis*, and reject that of the white clover.' By reference to such figures as those of Mr Worthington Smith, the commoner species, both esculent and poisonous, may be easily discriminated; and many useful hints regarding the method of using them will be found in such a work as Mr Cooke's *Plain and Easy Account of British Fungi*. As a general rule, such as are of sweet odour, especially such as have the smell of new meal, are safe and wholesome. Nearly all that can be said by way of caution may be summed up thus: Such as are disagreeable in smell, or acrid to the taste; such as contain milk (*Lactarii*) other than the one orange-coloured; such as turn blue when the flesh of the fungus is cut or broken (*Boleti*); and, generally, such as grow on wood—should be carefully avoided. And in all cases, they should be used only when young and fresh. Even the most wholesome become unwholesome and dangerous when old or in decay. As an example of this, we may mention the Giant Puff-ball (*Lycoperdon giganteum*), which is excellent when young, resembling sweetbread, but which has been known to produce serious consequences in its fully matured condition. The common notion, that all which grow under trees are dangerous, is entirely erroneous. It is true of the common mushroom—it should not be gathered in woods. But some of the best species, such as the Chantarelle, the orange-milk *Lactarius*, and *Boletus edulis*, are to be found almost exclusively in woods. In many cases, much of their wholesomeness seems to depend upon the method of cooking them; and with all of them, Mr Berkeley recommends that plenty of bread should be eaten. It has been supposed that salt and vinegar have special virtues in destroying the poisonous qualities of some. There are, however, so many which are perfectly wholesome, and which are at the same time so easily distinguished, that it is not advisable, without special knowledge, to make use of any whose qualities are doubtful.

In France particularly, immense quantities of mushrooms are cultivated. In Paris, they are grown in caves, some of which contain mushroom beds of many miles in extent. From these, large supplies are daily sent to market; and some cultivators preserve them for exportation. Even in this country the cultivation of them is found to be so profitable, that Mr Cooke tells us 'curious revelations sometimes crop up, as at a recent trial at the Sheriff's Court for compensation from the Metropolitan Railway Company for premises and business of a nurseryman at Kensington. The railway had taken possession of a mushroom ground, and the claim for compensation was seven hundred and sixteen pounds. It was stated in evidence, that the profits on mushrooms amounted to one hundred or one hundred and fifty per cent. One witness said, if fifty pounds were expended in twelve months, or perhaps in six months, the sum realised would be two hundred pounds.' Truffles, which grow underground, have always been favourite fungi in Europe, from the time of Pliny to the present day. They are to be found in some of the chalk districts in England, and are imported from the continent. Both pigs and dogs are trained to search them out; and on this special branch of the subject Mr Cooke gives some curious information; though a writer in a late

number of the *Revue des Deux Mondes* gives much of the credit of truffle-finding to pigs. Mr Cooke says : 'Some notion may be obtained of the extent to which the trade of truffles is carried on in France, when we learn that in the market of Apt alone, about three thousand five hundred pounds of truffles are exposed for sale every week during the height of the season ; and the quantity sold during the winter reaches upwards of sixty thousand pounds, whilst the department of Vaucluse yields annually upwards of sixty thousand pounds. It may be interesting here to state, that the value of truffles is so great in Italy, that precautions are taken against truffle-poachers, much in the same way as against game-poachers in England. They train their dogs so skilfully, that, while they stand on the outside of the truffle-grounds, the dogs go in and dig for the fungi : though there are multitudes of species, they bring out those only which are of market value. Some dogs, however, are employed by botanists which will hunt for any especial species that may be shewn to them. The great difficulty is to prevent them devouring the truffles, of which they are very fond. The best dogs, indeed, are true retrievers.'

One of the most interesting questions relating to fungi is the influence which they exert in the general economy of nature. We have already referred to the fact, that, like animals, they exhale carbonic acid, and absorb oxygen. In so far, therefore, as the atmosphere is concerned, they do not assist, like other plants, in maintaining the balance between animal and vegetable life. There seems to be no good reason for believing that they exercise, except in the case of certain skin diseases, any baneful influence on health, although speculation has been busy on the part which they have been supposed to play in the propagation and aggravation of epidemics, both among man and the lower animals. Among the lower forms of animal life, they are largely consumed as food ; some insects seem to depend upon them wholly for existence. We must look for their chief influence, however, to the vegetable kingdom ; and here, undoubtedly, they do exercise a very wide influence. The mischief which they cause to timber is great, and is too frequently exemplified on the wood-work of our houses, where one species of the Dry-rot Fungus (*Merulius lacrymans*) is so destructive. The rust and smut, the mildews and moulds which attack the cereals and green crops, are well known to the agriculturist. The gardener is familiar with them among his vegetables and fruit-trees ; and among our favourite flowers, such as roses, we have often to mourn over the ravages which they commit. During the past year, as readers of the *Gardeners' Chronicle* will remember, one of these pests threatened almost to exterminate the hollyhock. The hop gardens, the vineyards, and the olive groves of Europe, the cotton fields of India, and the coffee plantations of Ceylon, all bear witness to their destructive influence. But no more disastrous result, as it affects all classes, has been produced than in the case of the too well-known potato disease. All the earlier theories of the origin of this dire plague have been proved to be erroneous. It has now been established beyond doubt, chiefly by the researches of Mr Berkeley and M. De Bary, that it is produced by a fungus—a species of mould, which at first attacks the leaves, and speedily preys upon the tissues of the entire plant, reducing it ulti-

mately to a state of putrefaction. But greater far than all the mischief which they work is the good which fungi effect in the economy of nature. In regard to dead and decaying vegetable matter, they have been happily called 'the scavengers of nature ;' and if we reflect upon the universality of their presence, the work which they accomplish in robbing decay of its hurtful influences, by changing it into other forms of life, is no less wonderful than it is beneficial.

#### GONE AWAY.

I KNOW a quiet country town,  
By which a river falls and flows ;  
And in the dell and on the down,  
The yellow sunlight glints and glows.

I know a square gray house of stone,  
I never think of but I sigh,  
Beyond whose garden, smoothly mown,  
The rushing engines shriek and fly.

I know a chosen chamber there,  
A fairy figure used to grace ;  
I know an eastern window, where  
Was wont to watch, a fairy face.

I thread the narrow winding street,  
I linger in the lonely lane,  
Which once were trod by fairy feet,  
That will not tread their path again.

I love that quiet country town ;  
It is to me a sacred place ;  
And as I wander up and down,  
Those vanished steps I seem to trace.

And still the hours serenely pass,  
And still the busy river flows ;  
And still among the shining grass  
The yellow sunlight glints and glows.

And there the house is, square and gray,  
And there the new-mown meadows lie  
She used to gaze on day by day,  
In Faith, and dreamy reverie.

Yes, all is there—except the face.  
That little window gapes forlorn ;  
And on me, as I haunt the place,  
The morning sunshine smiles in scorn.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice :

1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

## A SOLDIER'S FRIEND.

THE modern soldier, whether in sickness or health, is very differently cared for now from what he was formerly. A veteran non-commissioned officer who had seen some half-century service, was descending to us not long ago in Netley Hospital on the contrast between a soldier's life nowadays and what it had been in the early part of his career; and the existence of the very building in which he lay is one evidence of the improved accommodation provided for him now. Standing on the banks of the Southampton Water, this splendid hospital is almost the first building on his native shore to greet the eyes of the returning invalid. The troop-ships coming into Southampton from India and elsewhere stop to land their sick at Netley; and on so vast a scale is the institution, that it is no uncommon thing for five or six hundred patients to be received into it on the same day without occasioning any unusual commotion. Beautiful grounds sloping down to the very water's edge; long covered galleries for patients who are unable to go out of doors to exercise in; spacious airy wards, and all the most recent improvements in hospital management, the whole under the control of an able and experienced medical staff, here offer to the invalid soldier every chance which skill and care can give him, of recruiting the health which may have been undermined by service in unhealthy climates, or by other causes.

Happily, the proportion of invalid soldiers to those who are sound is but small, and the amusement and instruction of these latter have been consulted by the introduction of Recreation Rooms in every barrack, which are well supplied with books, papers, periodicals, &c. This is a great advantage; but soldiers like sometimes to go out of barracks; they like to meet with other society than the men of their own regiments; above all, they like to escape sometimes from the eye of authority. Hitherto, the only resort for them in such cases has been the public-houses; and just as a man with every accom-

modation in his own house likes to go to his club sometimes, so it is only natural that a soldier should like to mix with his friends in places where he feels that he is free from the supervision of his officers. To provide such a resort for him, where he might find recreation and congenial society without the temptations of the public-house, has been the object of those who have tried the experiment of Soldiers' Institutes. The first of these institutions was established at Aldershot some ten years ago, and has since been succeeded by two or three others in different garrison towns of England. The one which was opened towards the close of last year in the town where, perhaps, of all others it was most needed, Portsmouth, is in some respects the most complete Institute, and it is of this that we propose giving a brief description. It derives a melancholy interest from the fact of its having been formally opened last September by that fine specimen of a Christian soldier, Sir Hope Grant, whose loss the army has so recently had to deplore, and who took the deepest interest in this, as in every other undertaking which has for its object the moral or social improvement of the soldier.

The Portsmouth Soldiers' Institute owes its foundation to the energy and perseverance of a woman. When the social history of the present age is written, one of the most beautiful pages will be that on which are recorded the deeds of women-workers, and among this noble and devoted band the name of Sarah Robinson, the 'Soldier's Friend,' will deserve an honoured place. From her earliest years Miss Robinson seems to have been inspired by a passion for soldiers and military exploits; but hers was not the enthusiasm which prompts young ladies to devote themselves to the study of the *Army List*, or to seeking a ball-room acquaintance with officers. Her ambition was to be the means of doing some good, morally as well as materially, to the soldier; and to this work she has given all her time and influence, at the sacrifice of all a woman's prejudices. That there is a large field for such work in the army, and that it is especially and pre-eminently woman's work, has

been repeatedly asserted by many of the ablest and most experienced of our military authorities. In spite of chaplains and lay helpers, in spite of a large number of earnest-minded officers—the salt of the army—there is a want in the soldier's life, unmarried as he is for the most part, and cut off from home and family ties, which can only be filled up by the influence of a woman. To this work Miss Robinson has devoted her whole time and means for the last twelve years; and we regret that want of space prevents us from following that lady to the different garrison towns, in each of which she was the means of doing an incalculable amount of good, and where she earned the blessings of those whom it is the object of her life to benefit.

Some of our readers will probably recollect the experiment tried by Miss Robinson two or three years ago, when, under the sanction of the War Office and the commander-in-chief, she accompanied the army during the autumn manoeuvres on Dartmoor and at Cannock Chase, taking the management of a refreshment hut and a recreation tent, the one to supply the troops with coffee, tea, canteens; the other, with provisions for letter-writing, newspapers, periodicals, books, and games. In order to superintend this undertaking, Miss Robinson was obliged to follow the troops, in a van, in which she made her dwelling in gipsy fashion during the whole period of the manoeuvres. The fatigue and anxiety attending the business were very great, but Miss Robinson had the satisfaction of finding that her experiment proved a complete success, and was the means of contributing immensely to the comfort and well-being of the troops. It was stated, on the concurrent testimony of those who were qualified to form an opinion, that there never had been so little drunkenness and crime in the camp as in that year; and the generals in command, and the commanding officers of regiments, expressed their gratitude to Miss Robinson. As to the men, there, as well as in other places, they were devoted to her; and to shew the genuine friendliness of feeling with which she inspired them, we may quote the words of one of themselves: 'We call Miss Robinson the Soldier's Friend because she isn't like some people who try to do us good. She doesn't sit at the top of the stairs, and tell us what we ought to do; but she comes down, and takes us by the hand, and looks us in the face, and leads us in the right way.'

It was, we believe, the successful results of this campaign on Dartmoor which determined Miss Robinson to start a soldier's institute at Portsmouth. We have stated that there could scarcely be more need for such an institution in any place than in Portsmouth; and in support of this assertion, we may remind our readers that Portsmouth is not only our chief military garrison, but is also a large naval station. It is here that most of Her Majesty's ships are paid off before being again put in commission; and it is here that the troops returning to England from India and other foreign stations disembark, and are generally quartered for some months before being sent elsewhere. During their foreign service, many of the regiments have accumulated money in the regimental savings-bank, which amounts in the aggregate to a considerable sum on their arrival in England. The sailors and marines too, on coming ashore after being paid off, are in possession of sums varying

from ten to fifty pounds apiece, which, with characteristic recklessness, they are impatient to be rid of. This is well known to the land-sharks who are waiting for their prey. Even before they can land the ships are boarded by touts and agents from the low lodging-houses and disreputable haunts in the town, whose object is by one means and another to become possessed of the earnings of the men.

In Portsmouth, with a population of something over one hundred thousand, there are upwards of one thousand public-houses, gin-shops, &c., but (until the establishment of the Soldiers' Institute) not one single Home, Institute, or respectable resort for recreation or improvement. In such a state of things, the demoralisation of the soldiers quartered there follows almost as a matter of necessity. It is stated that not long ago a single regiment on its return from India squandered six thousand pounds from the savings-bank within two or three months, and lost five hundred good-conduct badges.\* It is difficult indeed to over-estimate the temptations to which a soldier is exposed. With some spare cash, which he is quite willing to spend; with the natural inclination for enjoyment on his return home, after foreign service; surrounded by plenty of bad companions, who are eager to lead him astray; with no place of resort except the public-house, and with plenty of idle time on his hands—for under ordinary circumstances an infantry soldier's duties are over for the day by four o'clock, and from that till nine at night he is free to amuse himself as he pleases out of barracks—it is difficult, even for the best disposed, to avoid falling into bad habits. It was the consideration of this which induced Miss Robinson to direct her energies to the formation of the Soldiers' Institute at Portsmouth. The military authorities had been so favourably impressed by Miss Robinson's work during the autumn manoeuvres, that upon application, the War Office—not usually a very impressionable department—promised a government grant of land for the erection of a suitable building. Subsequently, the usual religious bickering arose, and the government, yielding to strong pressure on behalf of Roman Catholics, revoked the grant, except on condition that the Bible should be entirely excluded from the Institute. This condition, Miss Robinson, as a Protestant, was of course unable to accept, though it was never intended to force the Bible upon any one, but to have one room in the building specially reserved for a Bible class, which the soldiers might attend or not at their discretion, the other advantages of the Institute being equally open to all. How little of a grievance this could really be to any one, may be judged from the fact, that the Roman Catholic soldiers at Woolwich have voluntarily subscribed among themselves, and forwarded to Miss Robinson, a sum of ten pounds on behalf of the Institute—an instance of real Christian toleration and liberality which it is gratifying to have to record in these days of bitter party-strife and sectarianism.

\* This statement does not the least surprise us. We were told as a fact, by a commanding-officer, that the men in his regiment, on arriving in Edinburgh from foreign service, spent the sum of five thousand pounds—all they had in the savings-bank; the expenditure being in public-houses and disreputable haunts in the recesses of the Old Town. Yet, although the fact was made known at the time, no steps have been taken, so far as we are aware, to avert its recurrence.—ED.

The recognition of this prejudice by the government is the more strange when we remember that the Commission on Army Education felt so strongly the necessity of religious instruction for the men, that they recommended the providing of rooms for the purpose of Bible-classes, &c. in every barrack; and Lord Lawrence, when in India, took especial care that such rooms were everywhere available for soldiers and their instructors. Nothing daunted, however, by the loss of this gift, Miss Robinson set herself to collect funds for the purchase of suitable premises, and very shortly the well-known old *Fountain Hotel*, in the High Street, Portsmouth, was secured, and after undergoing the necessary alterations, the Soldiers' Institute was formally opened on the 10th of September in last year. Here Miss Robinson has taken up her abode, and personally superintends the management of the whole institution, which affords ample scope for all her energy and power of organisation. The institution, which is intended to be a club for the military, is designed for amusement and society, and—for those who will—for instruction. Though it is wholly undenominational in character, and though it is not intended to force religion on anybody, means are provided for those who choose to avail themselves of them, of religious instruction and opportunities for private prayer. The building is well suited to the purpose for which it has been adapted. Immediately opposite the entrance is a large bar, which is applied to the same use as it was during the existence of the hotel. Those who desire light refreshment, or who have not time to sit down in the coffee-room, find tea and coffee ready there at all times. The coffee-room is the apartment chiefly used for social intercourse and refreshment. Here soldiers meet and make appointments with their friends, and the men are encouraged to bring their wives and sweethearts with them. It is a long room about forty feet by twenty, filled with small tables for refreshments; and is supplied in addition to newspapers with draughts, chess, and dominoes. It looks into the main street of Portsmouth, which gives it a cheerful and pleasant appearance. Ascending to the next floor, we come to the reading-room, a large handsome apartment, of the same dimensions as the coffee-room below, panelled with varnished oak, and lighted at night by two large gas chandeliers. Both as to the comfort of its fittings, and the admirable supply of papers and periodicals of all sorts with which it is stocked, this reading-room is one which any club might be proud to possess, and together with a well-supplied lending library, furnishes ample abundance of literary food for those who frequent the Institute.

On the same floor as this reading-room is the apartment which has given rise to so much controversy—that for Bible-class meetings and religious instruction. It is free to all, but no one is pressed to attend it. It is just as entirely at the discretion of any one making use of the Institute either to frequent this room or to keep out of it, as it is of a member of a London club to choose whether he will enter the billiard or smoking room. On the same floor is a bath-room, which is fitted up with hot and cold water baths, and other conveniences. And a short distance off is a large room in which is held a sewing-class for soldiers' wives. The rooms on the upper floor are fitted up as dormitories with neat little iron beds and com-

fortable clean bedding, and are capable of accommodating nearly a hundred occupants when required. This is an especial boon to sailors (for in this seaport town the Soldiers' Institute is wisely and considerably thrown open to the sister service), who, on coming ashore, are generally in great need of a respectable lodging in which they can be secure from robbery and imposition. In another part of the building are rooms for the use of married soldiers and their wives and families, previous to embarking for foreign service, or on their return home. And this, it is believed, will be one of the greatest blessings of the institution, as the relatives of soldiers are exposed to great trials and difficulties on these occasions.

Upwards of nine hundred persons have been thus accommodated in the Institute during the six months of its existence; and as it becomes better known, its sphere of usefulness will be increased, as it is intended to send agents on board the troopships on their arrival in port, to apprise the soldiers of its advantages. Such institutions as these cannot fail to prove a boon to the army, and through it to the nation at large; for that which tends to elevate the soldier in public esteem, or to benefit him socially or morally, tends to the national welfare. It is to be hoped that the noble example given by Miss Robinson will lead other workers to follow in her steps, and that in every garrison town in the United Kingdom some 'friends of the soldier' will be found to present him, as at Portsmouth, with a Soldier's Institute.

#### THE EUROPEAN IN INDIA.

SUCH is the title of a book which has fallen in our way, purporting to consist of advices of various kinds to persons receiving appointments to India, and who are generally at a loss concerning outfit, transit, climate, housekeeping, servants, means for preserving health, and so on. As the work has gone through a second edition, it has evidently been accepted as an authority; and, from the sensible and practical tone in which it is written—there being an entire absence of sensationalism—we are encouraged to bring the volume still further under notice. There can be no doubt that, notwithstanding incessant discussions respecting the affairs of India, little is distinctly known for the guidance of young men who are destined to live for years in the country. To supply what is wanted, Mr Hull\* offers his best advices, drawn from personal experience; what he says being supplemented by the medical hints of Dr Mair, who is also an experienced Anglo-Indian.

We shall just glance over this handy *vademecum*, to give an idea of the contents. As to outfit, the author advises the purchase of a good stock of clothes to last some time, for all articles of dress are dear in India, besides being not very well made. An Indian made dress-coat, for example, has not the 'sit' of one produced by a skilled English tailor. One thing is on no account to be neglected—a stock of flannel shirts to be worn next the skin, day and night. 'Flannel,' says Mr Hull, 'is the best safeguard against fever, dysentery, and other disorders that carry off so many victims in the tropics. When the body is heated,

\* *The European in India*. By Edmund C. P. Hull. London: King & Co. 1874.

a profuse perspiration moistens the clothing; evaporation follows, checking the perspiration, and causing a chill, and hence illness in various cases.' It has to be kept in mind that evaporation takes place more rapidly from linen and cotton than from wool; hence the importance of wearing flannel. An Indian doctor is quoted as having said 'he would not throw good medicine away upon any one who could be such a fool as not to wear flannel.' The hint applies elsewhere than in India. Wool, in short, not only retards evaporation, and so prevents a sudden chill, but, from being a non-conductor of heat, keeps the wearer more cool than any other kind of clothing. A close attention to the advice offered on this point will spare thousands of lives.

For those who have to go to the hills, a thin Mackintosh cloak of a light colour is recommended to ward off wet; and for pedestrian travelling in forests and jungles, it is indispensable to have long gaiters for the ankles and legs, as a guard against the swarms of leeches that are ever on the watch to make an attack. These gaiters are of some cotton material, and, like stockings, need to be worn over the ordinary socks, and drawn up over the trousers to the knee, where they must be tightly tied. If a single crevice be left, the leeches creep in, and will mount perhaps to the armpits, where they propose complacently to bleed their victim. Such, at anyrate, is the well-known manoeuvre of leeches in Ceylon. There, as we are told by Sir Emerson Tennent, the leeches actually wait along the roadsides, standing on the tips of their tails, to fly upon the unwary traveller. As regards lady readers who are going to the East, Mr Hull repeats his injunction about woollen under-clothing, and for upper garments, recommends light fabrics, such as muslin, worn loosely. For evening dress, dresses of a thicker texture are necessary, for the temperature undergoes a sudden change after sunset. Part of the outfit for both sexes should consist of English or French gloves, 'carefully packed in flannel while thoroughly dry, and packed in a wide-mouthed bottle.'

India is now so much opened up by railways, that journeying through it to the principal places is comparatively easy, what took weeks not many years ago being now effected in a few days or hours. Taking the quickest route, by railway to Brindisi, and thence by steamer to Alexandria, after which railway to Suez and steamer on the Red Sea, one may travel from London to Bombay in twenty-one days, Madras in twenty-three days, and Calcutta in twenty-four days. To avoid danger and inconvenience from heat as far as possible, the best time for leaving England is the middle or end of September, arriving in India in October at beginning of the cool season. What, however, of the Red Sea, that furnace, the terror of travellers, even those by the best appointed steamers? Sometimes the heat is almost unendurable, and passengers try to sleep on deck. A gentleman of our acquaintance going out to India, would have died in his cabin, but for having got one of the stewards to give up his berth in the stern of the vessel, into which blew a current of air. For this boon he gladly gave twenty-five pounds. But the change of place was not enough. Stretched out to let the air play over him, he had his brow constantly moistened by his servant, by which meliorations he saved his life.

The worst time of the year is 'from 1st of May till the end of July.' In September and October the heat has considerably diminished.

Whenever he lands, the new arrival in India will be greeted with strange sights, the most startling, perhaps, being the swarthy, half-naked figures acting as boatmen or porters. A little experience shews that there is a considerable distinction in the native races. 'The Parsee of Western India is at once distinguished by his peculiar tall shining black hat, long coat, light complexion, and closely cut whiskers; the Mussulman by his shaven head; flowing beard, large loose turban, and frequently by his wearing loose drawers and slippers. Most Hindus shave the beard and whiskers, but grow the moustache; many shave part of the head; others all but a lock on the top. One or two tribes and the Brahmins shave the whole head closely.' The most muscular and good-looking natives are the warrior castes of Oudh, the Rajpoots of Central India, and the Sikhs; these Sikhs have an independent bearing, and make excellent soldiers. Generally speaking, the young Englishman is as little aware of the diversity of native tribes, as that there prevails a general culture, which, though not European, is considerably advanced, and deserving of respect. There is too great a tendency to speak of all kinds of domestic servants in India as 'niggers,' or 'black men.' To do so is a great mistake. By taking care to have good servants, they will be found to be quite as much deserving of consideration and of being spoken to respectfully as English domestics. Mr Hull mentions the wonderful quickness and fertility of resource of native servants. 'On a journey, they are hardly ever at a loss, and will contrive to provide a satisfactory meal on the shortest notice, with the most slender materials and appliances. Three stones from the road-side, arranged by a cook under a tree, will form a fireplace; a few sticks, a fire; and an earthen chatty, purchased for something over a penny at the nearest bazaar, will be made to do duty for saucepan, kettle, or frying-pan, as may be required. With such appliances, or little more, a good dish of curry and rice, a stew, or cutlets will be prepared at the first halt, the necessary materials for the dish being everywhere procurable.'

The author adds: 'Many native servants are also excellent nurses during sickness, and will watch day and night by the bedside of a master, whose habitual treatment of them has entitled him to such a solicitude, and this they will do in a noiseless unobtrusive way, admirably suited to the sick-room.' While treating servants with proper consideration, and putting trust in them, it is recommended not to make too much of them. 'In a general way, I should be inclined to say that they cannot stand much praise. It takes them off their legs, and tends to make them conceited and troublesome.' We must refer to the book itself for hints regarding the number and classes of servants to be kept, according to the style of living. As is well known, there is an extraordinary division of labour. At Madras, for the house of a married couple in good circumstances, without children, there may be required eighteen men and five women servants, costing from a hundred and thirty-five to a hundred and fifty rupees a month. A rupee is equal to two shillings. But a bachelor disposed to live thriftily, may manage 'to get his curry and rice

cooked, his bed made, and his shirts washed, by no more than ten or eleven men, at a cost not exceeding sixty or eighty rupees a month.' Usually, every person living in a house must have a distinct servant, called a kitmutgar, to wait upon him or her. Married life in India thus entails a heavy expense, if from nothing else than the additional number of servants that must be kept. If there be children, the outlay is materially increased, because still more servants are required.

As regards railway travelling in India, there are, as in England, three classes of carriages. The fare by third class is very cheap, only three-eighths of a penny per mile, and by this class nearly all the natives travel. Europeans sometimes travel third class, but such is not commended in the case of throngs of natives of all descriptions. It was at one time apprehended that owing to the system of caste, natives would shrink from travelling promiscuously; but the exceeding cheapness, the rapidity, and the convenience of railway transit, have overcome scruples of this kind. The rail, in fact, is doing more to break down caste and modify prejudices than anything that has ever yet been devised. In this manner does practical science—the locomotive and railway—come in as a powerful aid to Christianity! Talking of caste, the writer before us offers some useful hints to strangers settling in India. 'You cannot, for instance, with propriety, offer a native gentleman a glass of wine in your house, much less invite him to dinner, because in doing so you would invite him to incur the greatest of all misfortunes—loss of caste; while at the same time you cause him to commit what he considers a breach of politeness, in declining your offers. . . . When a native gentleman calls upon you, he will expect permission before he can retire; and this should be known, to prevent awkwardness on such occasions.' Another thing is to be kept in mind: it is contrary to all etiquette to inquire after the female members of a native's family, or to speak to a female of her husband.

There is a common notion that the children of English parents cannot be reared in India. Our author does not contest this point, but gives it as his belief that children are often subject to very injudicious treatment. They are sent out of doors too early in the mornings, and so get colds, fevers, and dysenteric affections. During the day they are kept too much in darkened rooms, and not allowed to run about to get fresh air, under proper precautions as regards the sun. Then, they are not always provided with light flannel under-dress. Worst of all, they are 'ordinarily indulged with far too stimulating a diet;' stuffed with meat, broths, wine, and beer, instead of a diet of bread and milk, or something equally simple and nutritious. As a means of not only rearing children, but of preserving the health of adults, the various hill sanatoria established in India offer peculiar advantages. In the first place, in Southern India there are the sanatoria on the Nilgherries, six and seven thousand feet above the sea. Next, we have Bangalore in the Madras presidency; and, to pass over a number of others, we come to Simla in the north, and the divers residences for Europeans on the Himalaya Mountains, situated amidst the most magnificent scenery, and where, according to altitude, any one can choose a climate to his taste. Bombay has likewise hill refuges of this kind, largely resorted to. The fashion of families quit-

ting the plains in the hot season and proceeding to hill stations, is not new, but is only now coming generally into vogue, and to all appearance the time is not far distant when, for the sake of health, Anglo-Europeans will scarcely need to return periodically to Europe. At several of the hill stations, five to six thousand feet above the level of the plains, you enter on a climate like that of an English summer; you see around you the oaks, the apple-trees, the bushes, and flowers that greet the eye in Hertford or Devonshire. There, also, are seen rows of English-looking villas and cottages, with all the appliances of an English home. If the weather is felt to be too warm, you go a stage higher up; if too cool, you go down hill. It cannot be doubted that by this hill-station system, and by precautions otherwise, European families may become almost naturalised in India, by which a serious difficulty would be in a great measure solved. Here, again, is observed the powerful influence of railway communication, without which the more distant hill sanatoria could not be made popularly available.

After giving numerous advices concerning household management, the writer adverts to insect annoyances. Here, we approach a delicate subject. A lady who spent several years in Calcutta has told us that so tortured was she with animal life in its multifarious forms, that rather than return to that city she would consent to sweep the streets. Perhaps, if taken at her word, she would have changed her mind; but her vehemence at least demonstrated the extent of the annoyance. To begin with, ants abound to an extraordinary degree, intruding everywhere, and eating up every edible that comes in their way. A single crumb of bread does not escape them. When the attacks become personal, the torment is less endurable. 'One or two of the small red species will sometimes indulge in a trip down one's back, and begin to amuse themselves by trying the soil with their digging implements; an operation far from pleasant.' We are told that the best way of keeping off ants is by isolation in water. This seems probable. The legs of tables, sofas, sideboards, and beds, may stand in dishes of water; but unless people get accustomed to stand in tubs of water, we do not see how the enemy is to be kept at bay. White ants are still more voracious; they devour trunks, portmanteaus, boxes, and all kinds of wood except teak and ebony, which are too hard for their jaws. Against this terrific pest, it is necessary that every case or box should be raised on pointed feet, or stones, bricks, or empty glass bottles. The author has no confidence in anything but a thick layer of asphalt. By schemes of this kind, ants, red and white, may be circumvented; but other insect pests remain to be dealt with. 'Fleas,' says Mr Hull, 'are undoubtedly one of the plagues of India. Houses that have been recently vacated become filled in an incredibly short time, and persons entering will in a few minutes find themselves almost black with these vermin.' What afflicts one to know is that, 'bad as fleas are on the plains, they are ten times worse on the hills, and always prove one of the most serious drawbacks to Anglo-Indians in search of cool air.' Let there, however, be this consolation: fleas can be expelled, or at least kept within bounds, by plastering the floors with 'cow-dung wash;' the walls to be white-washed simultaneously, to fill up

chinks. As to bugs, they may be left to be treated according to English usages. Mosquitoes may be kept down by well-plied punkahs, and their attacks at night averted by net curtains. These tormenting animals, however, loiter about in clothes or towels, which require to be shaken to get rid of them. Scorpions are another class of animal annoyances. They lurk under tubs or any other retreat, and it is necessary to shift articles frequently to expel them.

Not the least valuable part of the book before us, and that which should be especially studied by young Anglo-Indians, consists in the medical guide by Dr Mair. We gather from his remarks that much of the blame thrown on the climate of India is undeserved; and that very many of the disorders by which Europeans are affected arise from neglecting rules for the preservation of health. Too little regard is paid to the effects of heat on the system, and of the value of periodic change to a cooler atmosphere. This intelligent authority sums up by saying: 'A residence for one month at least in every year on some of the hill stations, and a thorough change to a European climate for twelve months, after each ten years' residence in India, would do much to remove or remedy the deteriorating effects referred to.' Any such change, however, will go but a small way in the face of an obstinate persistence in daily neglect of ordinary precautions. The young Englishman in India is apt to forget that he cannot with impunity drink spirits as if he were in the Highlands, or eat luxuriously as he would do in a club-house in Pall-Mall. By artificial stimulants, he forces the human machinery beyond its powers of endurance, and perishes; leaving the climate to bear the blame of his premature decease. Speaking to Anglo-Indians emphatically on this subject, Dr Mair says: 'Brandy, whisky, gin, arrack, or any other ardent spirit, must be shunned as poison, and, like all other poisons, should be taken only under medical advice. Medical experience condemns them as totally unnecessary to any one in health, and yet, next to beer, if not equal to it, the most common alcoholic stimulant used in India is brandy. In some districts, the Englishman is marked out by the natives from every other race by the fact that he eats beef, drinks brandy, and has no religion.'

We commend this book very earnestly to the perusal of all young men, and young women too, about to proceed to India. w. c.

### WALTER'S WORD.

#### CHAPTER XLIII.—THE TEMPER.

**SLEEP**, Walter had feared, would have been impossible for him, under the circumstances in which fate had placed him; but Nature, while we are young, is kindly to us, and gave him several hours of refreshing slumber. He welcomed them not only for the forgetfulness they afforded, but because they would give him strength to bear whatever brigand cruelty might have in store, with such manliness as belonged to him, and, above all, to support the old merchant as much as possible by the exhibition of a bold front. When Francisco came, therefore, as had been agreed upon, at an early hour, to conduct him to the hotel, he found the young Englishman calm and

collected, and with even less disquietude in his manner than such an interview as lay before him would have seemed to warrant. Had his own position, indeed, been less momentous, the circumstances under which he was about to visit Lilian would have been painful and embarrassing enough, nor, perhaps, in that case, would he have sought to see her at all. Not only was it in some degree a risk to her as respected her health, but the proceeding itself was clandestine—that is, unknown to Sir Reginald, who, after all, was, in the absence of her father, her natural guardian and protector. However, it was no time now for the entertainment of any delicate scruples. At the door of the hotel, he was left by Francisco in the hands of Julia, a soft-eyed Sicilian, who, since Lilian had not her English maid—for whom there had been no room on board the *Sylphide*—had been appointed to the post of sick-nurse. As she led the way up-stairs, and passed the floor occupied by the Selwyns, she answered an inquiring look that rose to Walter's face.

'Sir Reginald is asleep, signor, nor will he rise for the next two hours; but you will see Milady Selwyn.'

This was a great relief to Walter, upon Lilian's account, even more than upon his own, since Lotty's presence would afford full authority for his visit; and when, at the next landing, he found her at the door waiting to receive him, he felt more kindly towards her than her weakness had permitted him of late to do. He knew that she was daring much, in thus admitting him to her sister's presence, without the knowledge of her husband, and that to dare was, with her, to act against her nature.

'You will not talk with her long,' pleaded she, 'Mr Litton, will you? Lilian is very weak and feeble; and, above all things, refrain from speaking about—that matter we were talking of yesterday.'

'About your father's peril?'

'Well, about your apprehensions upon his account; Sir Reginald assures me that there is no real danger. There is nothing to be gained by dwelling on it; and if my sister should share your fears, it would have a very bad effect upon her.'

'You may rely on my prudence, Lady Selwyn,' answered Walter quietly; and thereupon she led the way into the sick-room. The first appearance of Lilian gave Walter an uncomfortable notion that he had been deceived as to her true condition; she was not 'up and dressed,' as the phrase goes, it is true, but she was lying on a couch by the open window, attired in a dressing-gown, and looking more like a convalescent than one who had so recently been reported as dangerously ill. The hand which she stretched out to him, indeed, was so thin as to be almost transparent; and the voice with which she welcomed him was almost as weak as that which had murmured his name when they parted in Joanna's cavern; but, instead of the spot of scarlet that had then burnt upon her pallid cheeks, there was now a rose-pink blush, which was certainly not the flush of fever, though it might have been summoned there by his coming.

'This is better than when we met each other last, Walter,' said she, with a sweet smile.

'It is indeed, darling.' He could say no more, since the truth was not to be said.

'I long to hear how you got away from that

dreadful place, but they say you must not tell me now.' The tears, from the mere consciousness of her weakness, stood in her soft eyes, which also brimmed with love and tenderness. 'But one thing you must tell me—about dear papa. When shall I see him, when will he be here?'

Walter hesitated. Should he tell her a lie with his dying lips? or the truth, that must needs kill her?

'You have forgotten, my dear Lily, that the ransom has not been paid,' interposed Lotty gently.

'But why is this long delay? How cruel it is to keep poor papa in captivity! He must have been days and days, though I know not how long. Do, dear Walter, hasten it.'

'I have done what I can, dearest.'

'And you are still doing your best, I am sure. But what is the obstacle?'

'The sum is so very large,' said Walter, scarce knowing what words he spoke; it was so pitiful to hear her, so pained with even what she knew, so ignorant of what must needs give her so much greater pain.

'Nay, but surely the bank can raise it. What papa wrote was surely sufficient. I kept it next my heart, as though it had been a letter of your own, Walter.'

Walter turned his eyes involuntarily towards Lotty, with a mute: 'You hear *that*?' but her gaze was fixed upon the floor. If she did not know that her husband had possessed himself of the authorisation, he felt sure that she suspected it.

'Is it possible that they refuse to pay it?' inquired Lillian, raising herself, in her agitation, upon her elbow, then instantly sinking back again through sheer exhaustion. If, when Walter had first entered the room, a hope had risen in his breast that Lillian herself might be made the means of saving two doomed lives, it here fell to rise no more. If he could have seen her earlier, and brought the banker to her bedside, something might perhaps have been accomplished; but, as it was, he felt all was over. It was manifest that the little strength she had, had been already expended in saying those few words. There was nothing for it but to leave her to the short-lived bliss of ignorance.

'The bankers do not refuse to pay it, Lillian, but—but we must have patience.'

'Poor dear papa!' sighed Lillian, so softly, that none but a lover's ear could have caught the sound. 'How wretched he must be among those terrible men! O Walter, when shall we see him?'

'I shall see him to-day, Lillian,' answered Walter solemnly.

'To-day!'—with a slight flush of joy—'that is well indeed. You need not have been afraid to tell me such good tidings. It is bad news, not good, that kills one.'

Walter's heart sank low within him at these terrible words; still, he made shift to smile upon her.

'Tell him, with my dearest love,' she went on, 'how I long to see him, and to clasp him in my arms! And tell him that if anything could add to the happiness of such a moment, it will be the thought that you have brought him to me. He will not—he will not wish to keep us asunder now, Walter!'

Then she closed her eyes, and Lotty made a sign to him that he should withdraw.

Walter bent down, and took his last kiss of Lillian; a faint smile played upon her pale lips as he did so, but they did not part even for a word of farewell; and his bursting heart felt grateful that they did not. He could not have answered her 'good-bye' with firmness.

Lotty left the room with him, and, as those who watch the sick are wont to do when their invalid has a visitor, inquired of him what he thought of Lillian. 'Is she better than you expected, Mr Litton?'

'She is better than I was led to expect,' answered Walter coldly.

Lotty's cheek turned a shade whiter, as she observed, without reference to this reply: 'Yet she is still so weak, that a breath would blow her away.'

'Yes; a breath of ill news. You heard what she said just now. That news will come to-morrow, and then Sir Reginald will have the blood of three innocent persons, instead of two, to answer for.'

'O sir, be pitiful!' cried Lotty, trembling.

'What! pitiful to the man who stole that authorisation from yonder sick girl—plucked the father's life from the daughter's bosom! Pitiful to the man who has lied to me about Lillian's health painting her as out of her mind, lest I should question her, and prove him thief, or use her services to save the doomed! Pitiful to the man!'

'No, Mr Litton—not to the man; I cannot ask it; but to the woman! Pity *me*, who am his wife.'

'I do, I do.' The pleading misery of her tearful eyes had quenched his rage. If she had had any hand in deceiving him, it was an unwilling hand, nor had she been thoroughly persuaded of the peril in which her father stood.

'I pity you, Lady Selwyn, from my heart; and if—if I should never see your face again'—

'Oh, Mr Litton!' she interrupted, 'then you cannot forgive me?'

'Yes; I forgive you. A time will come, and soon, when it will be a comfort to you to know as much. Keep all news that comes to-morrow from Lillian's ears, from Lillian's eyes, I charge you. Play the hypocrite with her, for my sake, and for your father's sake.'

'I can do that,' said Lotty bitterly: 'Heaven knows, I am used to that.'

Perhaps Walter was wrong to think that at that moment he of all human creatures was the most wretched; yet, with Lotty, wretchedness was but as a cloud which passes.

'And shall you really see dear papa to-day?' she went on eagerly.

'Yes; to-day.'

'Then you will give him my love too, with Lillian's, and tell him nothing—nothing—that'—

'Nothing that will make one daughter less dear to him than the other, Lady Selwyn, you may be sure.'

'God bless you, for that, Walter.'

'And God bless *you*, Lotty, that should have been my sister. Farewell—farewell!'

The hand she held out to him was carried to his lips, then he turned and went down-stairs, with the slow step that bears a heavy heart. He had seen the last English face, save one, that he should ever see—that one which would meet

his own with hopeless agony depicted on it. He saw it even then, even while the morning-tide of men was setting in around him, with looks of pleasure or of business, and with thoughts for the morrow, and the next day, and for a year to come; he saw it, in its woe and disappointment, reflected in the clear wave and the clear sky; he was with it in that camp among the mountains, before he had left the city walls behind him, and was a captive once again, before his time.

Francisco brought him his breakfast, but asked no question concerning his recent visit to the hotel, an omission which, to judge by the earnest look with which he regarded his father's lodger, whenever Walter's eye was not upon him, was certainly not owing to any want of personal interest.

'Has Signor Litton any plans for the day?' he inquired presently.

'Plans for the day?' repeated Walter, whose mind was so occupied with the thought of what the day had in store for him, that he did not readily understand the question.

'I mean,' explained Francisco, 'will you not have a sail in the bay, signor, such as used to please you? There is a pleasant breeze afloat, though none on shore; and we can have the old boat, or, for that matter, the signora would doubtless let you have the yacht itself: it has lain idle these many days, and will do so, I suppose, till Milord Brown's ransom is paid.'

'I suppose so,' answered Walter mechanically. There was something in his face which seemed to convince Francisco that questioning would be of no avail, for immediately afterwards he withdrew.

Walter lit his pipe, as he was always wont to do after the morning meal, and sat at his window until the hour of noon; then he took a last look around the room, saw that the letters and two little packets of money were in a place where they could easily be found, and left the house, walking slowly along the Marina, eastward. Every step he took was away from the habitations of his fellow-men, and was, as it were, an act of farewell to them. We are wont, and justly, to give honour to those who volunteer to lead 'forlorn-hopes,' and put their lives in extreme peril from shot and steel; but such heroes have at least companions in their noble act, and the excitement of battle, fought under the eyes of their comrades; moreover, though the risk to life is great, there is a secret hope in each man's heart that he may return alive. Now, Walter Litton was alone; only one man in all Palermo—and he an enemy—was cognisant of the sacrifice he was about to make; and death was certain. He had already got within a hundred yards of the end of the Marina, when he heard footsteps, quick and heavy, coming behind him, and then his own name called out in English: 'Litton—Walter Litton.' He turned round, with cold surprise (for he knew the voice), and beheld Reginald Selwyn. He thought that this man had discovered his interview with Lilian, and was about to seek a quarrel with him, though Sir Reginald's face, albeit it was very grave and unwontedly pale, shewed, in truth, no signs of anger.

'What is it that you want with me, sir?' said Walter slowly.

'I want you not to be a fool, Litton,' answered the other frankly. 'I have been thinking over what you told me you had made up your mind to do, in

case the extravagant demands of these villains were not complied with, and, though I did not believe you then, I believe you now. It seems to me that you are mad enough for anything.'

'I am not mad, sir; though, thanks to you, my lot is a very unhappy one.'

'But it need not be so, if you will only listen to reason. It cannot, surely, be your purpose, out of a quixotic sense of honour, to give yourself up to these rascals, that they may take your life?'

'I intend to keep my word, Sir Reginald Selwyn.'

'In other words, you intend to commit suicide.'

'No, sir; it is you and Corrali who will, between you, have murdered me. Some touch of tenderness, born of an ancient friendship, may have moved you to urge me thus; if so, let it move you further. There is time—though there is hardly time even yet to repent of your baseness, and to procure your father-in-law's ransom. By that means, you will save both our lives; but otherwise, the blood of both will be on your head: I call Heaven to witness it.'

'That is all rubbish, Litton. I cannot consent to be a party to any arrangement with thieves and robbers, such as you propose.'

'You mean, you will not.'

'Well, if you choose to take it that way, I will not.'

'Then your refusal is our death-doom, and you know it.'

'And your departing thus will be Lilian's death-doom,' returned Sir Reginald, 'when she comes to know what has happened. If I was the scoundrel that you pretend to believe me, I would say "Go;" for Lilian will die, if you do so, and my wife will, of course, inherit her money. But, on the contrary, I intreat you not to go. Only think of the chances you are throwing away. It is true, that hitherto I have done my best to oppose your marriage with my sister-in-law; but I will oppose it no longer.'

'And your father-in-law having been put to death—you would add—there will be no other obstacle to it.'

'Well, of course, if anything happens to Mr Brown—mind, I don't say it will—I don't believe it will!'

'You lie!' interrupted Walter sternly. 'You know that death will happen to him, even better than you know it will happen to me. But you wish not to be alone in your villainy; you would bribe me into being your confederate, to keep silence, and to share your guilty gains. You are baser and viler even than I thought. Tomorrow, you will be known for what you are; but if you dare to tempt me any more, you shall be known to-day. There is some one coming this way; if you do not leave me, I swear I will tell him what you have done, be he who he may. Begone, I say!'

The approaching footsteps were now drawing very near, yet Sir Reginald still hesitated. 'I have striven to save you, Walter Litton,' he said hoarsely.

'Yes, to shame and infamy; I refuse to be saved upon such terms. It is hard to die, but I prefer the death that is awaiting me, to the life that awaits you, Reginald Selwyn.'

As Walter pronounced the name in a loud voice, Sir Reginald pushed his straw hat over his eyes,

and turned upon his heel, only just in time to avoid Francisco, who came up, panting for breath. He had been running, which Walter had never known him to do before.

'Oh, Signor Litton, what is it that you are doing?'

'I am taking a walk on the Marina, Francisco,' returned Walter, forcing a smile.

'But afterwards?'

'Well, afterwards, when I get to the wall yonder, I shall strike across into the country. Did you suppose I was going to throw myself into the sea?'

'No, signor; but you are about to do something as bad, or worse. Why have you left that money behind you, for me and Julia, as though we were never to see you more—and worse, for your own burial in the cemetery?'

'It is always best to provide against the worst, Francisco; then, whatever happens, the mind is calm. I did not know you would visit my room so quickly; but since you have done so, you may take the letters you have found there to their destinations: one to the English consul, and the other to Lady Selwyn.'

'But none for her sister? Ah! that alone gave me hope, for you would surely have written to the signora,' said he, 'had you intended never to return.'

'Most certainly, I should, my lad.' Walter had inclosed his letter to Lilian in a note to Lotty, begging her not to deliver it until the former had regained her strength.

'Hush!' whispered Francisco. 'Listen!'

From the trees which fringed the road upon the landward side, there had come a sound which Walter understood only too well; Santoro was becoming impatient.

'Santa Rosalia! that is the brigand call, signor.'

'I know it, Francisco; and I must needs obey it. Farewell! and Heaven be with you.'

The next moment, Walter had sprung over the wall, and disappeared. Francisco uttered a cry of despair, and fled back at full speed towards the city.

#### CHAPTER XLIV.—THE PROMISE KEPT.

'We must make good speed, signor,' said Santoro, who was in waiting for Walter behind the wall. 'That young fellow whom you have just parted from was the same who was watching us last evening at the cemetery. I am much mistaken if the troops are not sent out after us immediately, and it is possible that this time they may know where to find us.'

He was referring, of course, to Corrali's camp, which, in that case, would have to shift its quarters, and the observation struck poor Walter as cool and selfish enough under the circumstances in which he was placed. He neither expected nor desired praise for the voluntary sacrifice of liberty and life that he was about to make, but that it should be thus altogether ignored, filled him with disgust. The fact was, however, that Santoro's intelligence was not sufficiently high to understand that the position of the young Englishman was altogether different from what that of one of his own fellow-countrymen would have been in similar straits. Had a Sicilian been suffered to escape Corrali's hands on similar conditions, he might also have fulfilled them—but upon compulsion;

his wife, his children, his friends, would have all been held responsible for his breach of faith, and a terrible retribution would have been exacted from them. Yet even Santoro had a soft spot in his heart, as was presently made manifest. They had passed on their way for some time in silence, and having crossed the main road, were about to ascend the lower slopes of the mountain, when he thus addressed the companion who had once more become his prisoner: 'I suppose, signor, you would never consent to become a brigand?'

'A brigand? Well, I have never considered the matter, Santoro, but I honestly tell you that I don't think it would suit me.'

'Ah, the damp and the cold, no doubt, are unpleasant, and especially when there is not food enough to make one indifferent to them; still, it is better to shiver a little, and even to want food and drink, than to die, signor.'

'Doubtless, Santoro,' answered Walter, unable to restrain a smile at his companion's simplicity and want of morals. 'But there would be also other objections; and, besides, no one has offered me the alternative.'

'Ah, but there is one who might do so. Look, signor, I have no desire to kill you, like some of those up yonder; on the contrary, I would have you live. You are brave, or you would not have smiled just now—you are strong and active; you would make as good a brigand as the best of us. Why not marry the signora?'

'Marry the signora!' For the moment, Walter did not understand to whom his companion was alluding, for there was but one woman to whom his thoughts reverted—she who in a few days would be mourning for his death, bereaved of love, almost ere love was born.

'Yes, marry the Signora Joanna. She adores you, Signor Litton, for Lavocca told me as much. Only consider the matter. We could both—that is, you and I—be married at the same time; then with our wives, and the two other men, we should form a separate band, independent of that scoundrel Corbara, though, of course, we should be under orders as respects Corrali.'

The crudity and childishness of this design were such as once more to try Walter's gravity, but he answered seriously enough: 'My good friend, such a plan would be impossible under any circumstances.'

'What! you would rather die than marry a pretty woman?'

'I did not say that; but I would certainly rather die than accept such conditions of existence as those you have proposed to me.'

Santoro looked at his prisoner with amazement. 'Well, you Englishmen are strange folks. I dare say you would not marry my Lavocca herself?'

'Indeed, if it were upon the same terms, I should be obliged to decline even that honour.'

'Come on!' cried Santoro, with a gesture of impatience and disgust, as he started up the hillside at the swing-trot peculiar to his class; nor did he utter another word for hours.

Walter was well aware that the proposition that had been made to him could never have originated with his companion, but had been most likely suggested to him by Lavocca, who might certainly be supposed to know the inclinations of her mistress. On the other hand, he did not believe that the latter had authorised her to make it. Joanna,

though ignorant and impulsive, had, he felt, an intelligence much too acute to entertain such an idea with seriousness. That she was in love with him, however, was certain, and in that love, he felt, lay his only hope—if hope there yet might be. She had already shewn her good-will towards him; but in effecting what she had, had also shewn the limits of her power. After a long climb in silence, they came to an open space, the apex of a spur of the mountain, from which there was a magnificent view.

'By Heaven, there they are!' exclaimed Santoro suddenly.

Walter's heart beat fast as he heard him; he thought that they had already come within sight of those who were about to be his assassins. But the brigand's eyes were fixed upon the place from which they had ascended, on the main road, through which was passing a long column of troops; while in advance, and to eastward of the hill on which they stood, was a cloud of dust, with the sunlight glinting through it upon lance and helmet. It seemed to Walter as unreasonable that cavalry should be sent after them, as though a ship of war had been despatched on such a service, and he said so.

'Their object is,' explained Santoro, 'to surround us altogether, before proceeding to attack the camp, the position of which, it seems, has been discovered. The government is making a great effort for the English milord, but it will not be to his advantage. If Corrali has caught sight of the soldiers, it is ten to one that it will have gone hard with your friend already.'

'But surely he will have kept his word with me, as I with him; he gave us until eight o'clock to-night.'

For the moment, it struck Walter that if what Santoro said were true, and violence had been already offered to the unhappy merchant, he himself was under no obligation to keep his bargain; and what could be easier than to run down the hill and join the soldiers! The thought had hardly crossed his brain, when the execution of it was rendered impossible, by the appearance of two men with guns, who seemed to spring out of the earth, and interposed themselves between him and the road to liberty. It was evident that they had been lying in ambush, and that he had unconsciously passed by them on the way. Of all faces that could meet his own at such a time, those of these two men were the most hateful and unwelcome, for the new-comers were Corbara and his creature, Canelli.

'Welcome, signor,' said the former sardonically, and lifting his battered wide-awake in mock salutation—'welcome, though I see you come empty-handed. It seems to me that you were half repenting of having returned to us.'

'Come, come, let us be fair,' put in Santoro good-naturedly; 'the signor has kept his word, and we have no right to complain.'

'No right to complain, when he has let loose those dogs upon us!' and the speaker pointed towards the soldiers. 'They are pouring in, it seems, from every point in the compass; and yet, if they poured from the sky itself, they would not save you, Mr Englishman.'

'No, no; they will not save him,' echoed Canelli grimly. 'If they kill us, we will have our fun first, lieutenant; will we not?'

'There, hark to the young bloodhound!' continued Corbara, laughing. 'He was not so fortunate in winning the signora's money from the rest of us as he expected to be, and that has rather put him out. Has it not?'

'There are others, at all events, less in luck than I am,' answered the young brigand, looking at Walter menacingly, and fingering the knife in his girdle. 'They have not waited for eight o'clock with the old fellow up yonder, and why should we be more particular with this one?'

'Stand off!' cried Santoro sternly, 'and keep your hands to yourself, or I will let daylight through you. I am answerable to the captain for my prisoner here, and you had better not interfere with him.'

'Well, he will not give you much trouble after he gets up yonder,' observed Corbara brutally; 'only, let us be all there before the play begins, remember; that's only fair.' With that they parted, the two brigands moving down the hill, while Walter with his guard continued their ascent.

'Santoro,' said he suddenly, 'will you do me one favour before I die?'

'Very readily, signor,' answered the other, not without a touch of feeling in his tone. 'What is it you would ask of me?'

'Only the loan of your knife.'

'No, no; don't think of that yet, signor. If you will be guided by me, things may not be so bad with you even yet. It is always time enough to kill one's self.'

'Not always, Santoro. Did you not hear what was just said to me?'

'Yes; but that fellow yonder is not everybody. Since you have come back like this, like a man of honour, and since, above all, Joanna loves you, you will not be tortured. She would never stand by and see it done.'

'In that case, I shall not need your knife; but against the other chance, I entreat you to lend it me, Santoro.'

'Will you promise not to use it against any of our own people—except Corbara? for if you have a fancy that way, I would not balk it. I can believe your word, I know.'

'Yes, Santoro; I promise that.'

'Then here is the knife.'

Walter took it, and hid it in his breast. He had a surety now that death would be the worst that he could meet with. Hardly had he concealed the weapon, ere Colletta and another brigand emerged from the trees in front of them.

'Ha! you have come back, then, without the money!' cried Colletta the silent, looking at Walter with sullen disfavour.

'The signor is quite as sorry for that as you can be,' answered Santoro: 'he has done his best, and failed.'

'His best will be the worst for him,' replied the other. 'The captain is out of his mind with rage because of the troops being sent out again; and since he never thought to see this young gentleman again, and, moreover, was indebted to him for their reappearance, he has been taking it out of the old one.'

'Do you mean to say he has murdered my poor friend?' ejaculated Walter with horror. He had heretofore tried to persuade himself that what Corbara had said about the merchant was a falsehood invented to give him pain.

'O dear, no; that would have been letting him off much too easily,' answered Colletta coolly. 'He only hung him up by one arm for an hour or so, with his toes touching the ground. The captain could hardly keep his knife out of the old scoundrel when he saw the troops instead of the ransom, and is gone down the mountain to cool himself by letting some blood.'

'Then who is in command up yonder?' inquired Santoro carelessly.

'The Signora! There are not half-a-dozen altogether; Corrali has sent out the rest of us in pairs, to let the soldiers know that brigands have teeth.'

The meaning glance which Santoro here cast at Walter fell upon barren ground; the young fellow's heart was full of pity for the unfortunate merchant, and it was one grain of solace to him at that moment to think that his reappearance would not be so bitter a disappointment to the captive as he had feared it would be. Mr Brown must already be aware that all hopes of procuring the ransom were at an end.

The two brigands left them as their fellows had done, to take part in the blood-letting (of others), which Corrali had found necessary for his system, or his temper; while Walter and his companion pushed on so quickly that before sunset, and therefore considerably in advance of the time appointed for their return, they presented themselves at the brigand camp. At the sight of them, a murmur of sullen satisfaction broke forth from its inmates, very different from the extravagance of feeling commonly displayed among them; and Joanna herself came forward to meet them with grave face.

'I ought not to say I am glad to see you, Signor Litton,' said she in a low tone; 'yet I can hardly be sorry that you have redeemed your word; I knew you would justify my confidence in it, though my brother scoffed at the idea, and has gone down yonder in the conviction that we should not see you.'

'He was wrong, signora; I am come back as I promised—to my death. All the favour I have to ask of him is, to let it be a quick one.'

'Do not speak of that just yet, Signor Litton,' answered she in a faltering voice; 'the time is not yet arrived.'

'I know it; and yet, before that time, as your people have informed me, some cruelty has been perpetrated upon my unhappy friend, contrary to Corrali's promise.'

'I could not help it,' replied Joanna pleadingly; 'the sight of the troops put my brother beside himself with fury, and when he is here, I am powerless.'

'But when he is not here?'

'Well, I can then do something, perhaps; and you may be sure,' added she tenderly, 'that all the power I have shall be at your service.'

'I would wish, then, to speak with Mr Brown at once.'

A look of disappointment passed over Joanna's face; she had evidently anticipated some request upon his own account; but she bent her head in acquiescence, and Walter moved on without hindrance to the spot which his fellow-captive usually occupied. He found the old merchant sitting on the ground, and guarded by the two men who had joined the band with Joanna. As Walter drew

nigh, he lifted up a pale and haggard face, that shewed such signs of pain as mental agony alone but rarely produces, and a sad smile lit up his features. 'What! Walter, my lad, have you come back?' he murmured.

'Yes, my friend, did I not promise to do so?'

'Ah, yes; but I thought human nature would have been too strong for you. However, if they are not brute beasts, they will surely not treat you with such cruelty as they have treated me. I know now what it is to wish to die.' A groan here escaped from the old man's heart that would have moved any heart save that of a brigand.

'They shall never torture you more,' whispered Walter; 'I have a knife here, which I am about to drop into your pocket. In the last extremity, you will know what to do with it.'

'And you, Walter?' hesitated Mr Brown, as he grasped the weapon.

'I shall take my chance. There are two hours yet before—before they will do us any hurt, unless Corrali should return. And while there is life there is hope.'

The old man shook his head. 'Nothing but a miracle could save us,' answered he; 'it is all over.'

Walter had taken the precaution to bring with him a flask of brandy, and he now offered it to his companion, who put it greedily to his lips. The effect was instantaneous: the flame of life once more sprang up in its socket; and the familiar thoughts that had been numbed within him by despair were set free, and took their accustomed channel. 'How is Lillian, Walter?'

'She is weak and wan, sir, but no longer suffering. She has been very, very ill, unhappily for us all; but I think she is on the road to health. She sent her dearest love, as Lady Selwyn did; but neither are as yet aware of our sad strait.'

'That is well, since nothing can be done. Give me another drink, lad. How was it, Walter, that the payment of the ransom went amiss? Surely Gordon?'

'It was not Gordon, sir; it was Sir Reginald.' And then in a few words he told him what had occurred.

The old merchant listened in silence, save for an interjection or two of indignation and abhorrence. 'I had thought,' said he quietly, when all was finished, 'that there were no men in the world so wicked as these brigands, but it seems I was mistaken. Let us not sully our last thoughts by suffering them to dwell on such a villain.'

But, nevertheless, he could not divert them from the topic, but again and again reproached himself with his own blindness to the baronet's true character, and always contrasting it with that of Walter. At any other time, such comparisons would have been embarrassing, but the fact was, Walter scarcely heard them; his own reflections, unstimulated by the fiery liquor which had made his companion garrulous, were running in a far deeper groove.

The sun had set, and it was near the hour which had been appointed as the limit of Walter's return, when he was roused from his meditations by Santoro.

'Signor Litton,' said the brigand in low but earnest tones, 'the signora would speak to you.'

'Do not leave me, Walter!' exclaimed the old merchant piteously. 'They are going to put us to death; but at least let us die together.'

'Nothing will happen to either of you,' said Santoro, in answer to this appeal, the sense of which, if not the words, it was easy to understand, 'until the captain returns.'

'And then?' inquired Walter.

'Then you will die, and milord here will begin to die.'

Walter answered nothing, for he was sick at heart; but with a face composed and calm, arose, and followed Santoro into Joanna's presence.

#### ABOUT SHARKS.

SHARKS are usually spoken of as the most rapacious and abhorrent of sea-animals. That they are rapacious is undeniable, but why they are so is not generally considered. We will go a little into the matter. The shark, a fish of the family *Squalide*, when quite in his infant state, and only a few inches in length, exhibits a pugnacity almost without parallel for his age. He will attack fish two or three times larger than himself; or, if caught, and placed for observation on the deck of a vessel, he resents handling, and, with unerring precision, strikes a finger placed on almost any part of his body.

Two things contribute to the shark's determinate fierceness. In the first place, we may refer to his teeth, for of these engines of destruction nature has been to him particularly bountiful; and this species of bounty he has a peculiar pleasure in exercising. If he could speak, he would probably tell us that, besides being troubled with his teeth, which he could not help keeping in use, he had been gifted with enormous abdominal viscera, and that, more particularly, a third of his body is occupied by spleen and liver. The bile and other digestive juices which are secreted from such an immense apparatus, and poured continually into the stomach, tend to stimulate appetite prodigiously - and what hungry animal with good teeth was ever tender-hearted? In truth, a shark's appetite can never be appeased; for, in addition to this bilious diathesis, he is not a careful masticator, but hastily bolting his food, produces thereby not only the moroseness of indigestion, but a whole host of parasites, which goad as well as irritate the intestines to that degree that the poor squalus is sometimes quite beside himself from the torment, and rushes, like a blind Polyphemus, through the waves in search of anything to cram down his maw that may allay such urgent distress. He does not seek to be cruel, but he is cruelly famished. 'It is not I,' expostulates the man in the crowd, 'that is pushing; it is others behind me.' The poor wretch must satisfy, not only his own ravenous appetite, but the constant demand of these internal parasites, either with dead or living food; and therefore it is that, sped as from a catapult, he pounces on a quarry, and sometimes gorges himself beyond what he is able to contain.

Having said thus much of the rapacious habits of the *Squalide*, we would have it remembered that every man's hand is against them, and that no tortures are considered too severe to inflict upon them when caught. If they are relentless to man and every living thing around them, their insatiable appetite renders them equally destructive to their own species, and we of the white population of this globe ought to recollect, with some show of gratitude, that they always prefer

an African to a European; for although they are fond of men of any colour, a negro is to them as the choicest venison. Commerson tells us that one of the atrocious amusements practised on board slave-ships was to suspend a dead negro from the bowsprit, in order to watch the efforts of the sharks to reach him, and this they would sometimes effect at a height of more than twenty feet above the level of the sea. Wonderful are the tales that sailors tell of the various things that have been found in a shark's stomach, and it was thought that any substance that would enter its mouth was at all times acceptable. The following, which details a cruel trick, as described in the *Glasgow Observer*, dispels this illusion: 'Looking over the bulwarks of the schooner,' writes a correspondent to this journal, 'I saw one of these watchful monsters winding lazily backwards and forwards like a long meteor; sometimes rising till his nose disturbed the surface, and a gushing sound like a deep breath rose through the breakers; at others, resting motionless on the water, as if listening to our voices, and thirsting for our blood. As we were watching the motions of this monster, Bruce (a little lively negro, and my cook) suggested the possibility of destroying it. This was briefly to heat a fire-brick in the stove, wrap it up hastily in some old greasy cloths, as a sort of disguise, and then to heave it overboard. This was the work of a few minutes; and the effect was triumphant. The monster followed after the hissing prey. We saw it dart at the brick like a flash of lightning, and gorge it instantaneously. The shark rose to the surface almost immediately, and his uneasy motions soon betrayed the success of the manoeuvre. His agonies became terrible; the waters appeared as if disturbed by a violent squall, and the spray was driven over the taffrail where we stood, while the gleaming body of the fish repeatedly burst through the dark waves, as if writhing with fierce and terrible convulsions. Sometimes we thought we heard a shrill bellowing cry, as if indicative of anguish and rage, rising through the gurgling waters. His fury, however, was soon exhausted; in a short time the sounds broke away into distance, and the agitation of the sea subsided. The shark had given himself up to the tides, as unable to struggle against the approach of death, and they were carrying his body unresistingly to the beach.'

Crouch, in his *Fishes of the British Islands*, would indirectly claim some apology for the habits of the shark tribe; in reference to which he asks why the lion and the eagle should occupy the elevated places they do in popular estimation, as the king of beasts and monarch of the air. They live by the exercise of powers similar to those of the sharks, and if insatiable appetites are to take precedence, sharks ought to stand in the foremost rank.

The appearance of sharks occasionally upon our coast naturally creates a certain panic amongst bathers; and we may trace the breakage of the nets of our fishermen to their presence, among other causes. The six-gilled shark, or gray shark, is sometimes eleven or twelve feet in length, and is very destructive among the pilchards on the Cornish coast. The white shark is a formidable fellow; but although his class occasionally send over to our isles deputations of one or two, we have, fortunately, not had to record of late years

such a visitation as that of 1785, when hundreds appeared in the British Channel. This individual is perhaps the most formidable of all the inhabitants of the ocean. Ruysch says that the whole body of a man, and even a man in armour, has been found in the body of a white shark. Captain King, in his Survey of Australia, says he caught one which could have swallowed a man with the greatest ease. Blumenbach says a whole horse has been found in it; and Captain Basil Hall reports the taking of one, in which, besides other things, he found the whole skin of a buffalo, which a short time before had been thrown overboard from his ship. The blue shark is a horrible nuisance to the fishermen, but, fortunately, it is with us only in summer, when it makes itself known by hunting after the fish entangled in the nets, which it does by seizing both fish and net with its keen and serrated teeth, and swallowing fish and mesh together. As it is not always pleasant to have sharks following a ship, it cannot be too well known that a bucket or two of bilge-water has been known to drive them off.

The shark tribe are remarkably retentive of life, and instances are related which would be almost beyond belief, if not vouched for by numbers of witnesses. For instance, an individual was caught with a line; its liver was cut out, and the bowels left hanging from the body, in which state the sailors, as an object of abhorrence, threw it into the sea. But it continued near the boat; and not long afterwards, it pursued, and attempted to devour a mackerel that had escaped from the net. In another instance, a shark was thrown overboard after the head had been severed from the body; after which, for a couple of hours, the body continued to use the efforts of swimming in various directions—to employ the conjecture of a boy amongst the crew—as if it were looking for its head. Next, we have the thrasher, which has obtained the name of fox shark, because of the shape of its tail. The title of thrasher, however, is most appropriate, from its habit of lashing the sea with its tail, by which it has been known to put to flight a herd of sportive dolphins, and even to fill the whale with terror. The porbeagle is another of the shark tribe, and is a common visitor on the western coasts in summer. Then follows that too plentiful and rapacious fish, the toper, known likewise as the white hound, penny dog, or miller dog. However, as it swims deep, it does not do so much injury to the fishermen's nets as some of its congeners. Then we have the smooth hound, or ray-mouthed dog, or skate-toothed shark, which are presumed to come from considerable distances, from the kind of hooks sometimes found in them, which resemble those used on the coast of Spain. They feed upon crustaceous animals, but will take a bait. The picked dog, spur dog, or bone dog, but commonly known as the dog-fish, is the smallest, but unquestionably the most numerous of the shark tribe. It frequents our coasts all the year round, and even in the severest weather. Then there are the spinous shark and Greenland shark, which will not be driven away from feeding upon the blubber of a stranded half-immersed whale, although pierced with spears, but come again to the oleaginous banquet while a spark of life exists. The basking shark also occasionally casts up on our coasts. It is of a large size, is capable of breaking a six-inch hawser, and is only taken with

considerable difficulty. Then we have the rash-leigh shark, the broad-headed gazer, and the hammer-head or balance fish, which may be said to complete the list of these occasional unwelcome visitors to our shores.

And now that we have said so much that is prejudicial to the Squalidæ or shark community, let us see what we have as a set-off in their favour. As a food for man, the toper is found exposed for sale in the markets at Rome; and in Paris, that city of gastronomy, the small kinds of shark, when divested of their tantalising titles, are to be detected as *entrées* in the *menu* of many of the most distinguished families. For some years the dog-fish has afforded lucrative employment during the whole of the summer to the fishermen from the Naze to the Cape. It is, however, mostly smoked, and in this way is considered rather a delicacy. It is also dried and split as stock-fish for consumption in the country, as well as for export to Sweden, where it is greatly appreciated. It is likewise elsewhere a common article of food, amidst the choice of a variety of other fish, especially in the west of England, and, indeed, is valued by some who are far above the necessity of classing it with their ordinary articles of subsistence. It is used both fresh and salted, but when eaten fresh, it is skinned before being cooked. Lacépède, who speaks slightly of its flesh, informs us that, in the north of Europe, the eggs, which are about the size of a small orange, and consist solely of a pale-coloured yolk, are in high esteem. If prejudice could be got over, there is no doubt they would form an agreeable as well as nourishing article of food, as a substitute for other eggs in our domestic economy.

The shark fishery is carried on in many parts of the Indian Ocean, and on the eastern coast of Africa, and recently it has been pursued on the coast of Norway. About Kurrachi, in India, as many as forty thousand sharks are taken in the year. The back fins are much esteemed as a food delicacy in China, from seven to ten thousand of these being shipped to that empire annually from Bombay. In Norway and Iceland the inhabitants make indiscriminate use of every species captured, hanging up the carcasses for a whole year, like hams, that the flesh may become mellow. The liver, however, appears to be strictly prohibited everywhere, as a dangerous article of food.

Mr N. Brabazon in his Fisheries of Ireland, in allusion to the large shoals of sharks which pass annually along the west coast, on their way from the southern to the northern seas, speaks particularly of the basking shark: 'These fish are worth from thirty-five to fifty pounds each; and when so many as five hundred have been killed in one season, this class of fishing should be well attended to for the short season it lasts, if the weather is favourable to it, especially as it is at a time when other fish are out of season. The fishermen have a superstition that the fish will leave the coast if the bodies of those caught were brought to the shore.' Mr P. L. Simmons, in his *Waste Products and Undeveloped Substances*, gives almost incredible statistics of the vast amount of fish-refuse which is either left to rot on the coasts and putrefy the air, or thrown back into the sea unutilised, both on our own and on foreign shores; and he significantly points to its value as a manure not far inferior to guano, of which this country alone requires two hundred

thousand tons a year, and pays upwards of twenty-two millions sterling. Would it not, therefore, be wise for enterprise and capital to begin to turn more attention to the manufacture of fish-guano, of which the débris of the North American fisheries and those of the North Sea would furnish ample material?

### IN THE STILL NIGHT.

SOME years ago, I was appointed supervisor of a district in Ireland in which, for some time past, illicit distillation had been very rife, with special instructions to exert myself zealously for its repression. I took up my residence, accordingly, at a small decaying town not very far from the borders of Tipperary, and put myself into communication with the various officers of constabulary stationed in my district, to concert a vigorous system of detection. The results of this it is not my intention to chronicle. The events of a single night, which made a strong impression upon me, I wish to give an account of.

I had received a message from the sub-lieutenant of constabulary to the effect that his men had discovered an active centre of the illicit manufacture of spirits; that he had set a watch upon the place, and proposed, with my concurrence, to make a search of the premises that night, and a seizure of any unlawful implements, when he had reason to know that the concern would be in full operation. The nearest station to the scene of action was Portanoch, where a car would meet the train arriving at six P.M. to carry me to the scene of action.

At six o'clock, therefore, on a dark November night, I found myself at the dimly lighted station of Portanoch. Two or three peasants, and half-a-dozen squires and squireens, in red coats and top-boots, returning from a day's hunting, alighted with me. Some of these latter had been my companions in the railway carriage, and, during the journey, had been loudly lamenting that, owing to pecuniary difficulties, the master of the county hounds could not hunt his pack this season, and that they were thus obliged to go far afield for their sport.

Outside the station, several dog-carts and phaetons were waiting for the hunting-men; lamps flashing, and horses tossing their heads and jingling their harness impatiently; among the rest, a shabby country jaunting-car, with a rough and unkempt, but active-looking horse in the shafts.

'Are you waiting for me? Did Lieutenant Kelly send you?' I asked of the driver.

'Right, your honour; indeed, he did!' cried the man, briskly drawing up his car to the door. 'Jump up, quick; I'll have you to the barracks like the wind.'

We went bravely along the dark wet roads for some distance, and presently came in sight of the barracks, where a detachment of constabulary, in their dark, soldier-like uniforms, was drawn up prepared for a start. The officer in charge came up, and in low whispered words informed me of the plan of action. I noticed that the driver of the car—whose name I had ascertained was Murphy—seemed to listen eagerly, although he simulated an attitude of careless fatigue, huddled up in his seat, with some old sacking wrapped round him, and his caubeen pulled over his face.

'You'll follow the constabulary, and keep them in sight all the way,' I said, addressing Murphy.

'All right, your honour,' he replied in a low, husky voice.

The police dashed off at a swinging trot, and we followed at the same pace. The night was dark, as I have said, but the moon would rise in an hour or so. The road was good, and well defined between stone walls, and as long as we kept within sight or hearing of our guides, there was no danger of going astray. But the country seemed silent and deserted; there were no twinkling lights from cottage or cabin; no snug hamlets or comfortable roadside inns: all signs of habitation were wanting; we might, as far as appearances went, have been passing through some unpeopled wild.

Somehow, notwithstanding vigorous shouts and cracks of the whip, the horse began to flag, and we fell farther and farther behind the cavalcade. At last, a turn of the road shut them out of sight altogether. As we ascended a slight hill, the horse fell into a walk; and neither threats nor blows, the latter bestowed, I fancied, more upon the shafts than the horse, could move him to increased speed.

'Come, push on,' I cried impatiently; 'we shall be behind altogether.'

'Never fear,' said the man, getting down from his perch, and beginning to walk by the side of his horse—'never fear; don't I know the way a deal better than them blue-bottles!'

'What! Do you know where we are going?' I asked with surprise, for, as far as I knew, this had been kept a profound secret.

'Sure, 'tis for Tullybardine barony your honour's bound,' said Murphy, touching his hat. 'Didn't Captain Kelly give me my instructions! Don't I know a way that saves a mile and a half to the barony; and we'll be there long before them, after all.' So saying, he turned off suddenly up an avenue of trees, that looked appallingly dark and drear.

The short cut known to my friend Murphy was, it seems, across the demesne of Marrowinch, the residence of one Captain Blake, the master of the hounds mentioned by the hunting-men, whose fortunes, it seems, were now under a cloud. The road was a private one, and there was a stream to be crossed twice by plank-bridges that were in a state of doubtful repair; for which reason, no doubt, the constabulary had gone the longer round. But Murphy assured me that he knew every timber of the structures, and would guarantee my safety.

Once upon the firm gravelled road leading to the Hall, we bowled merrily along. We crossed the first bridge in safety, and presently passed the mansion, a huge ungainly building, with a square Cromwellian tower at one angle of it. All was in darkness there, except for one window in the upper stories. As we went by, a man came out from the shade of some trees, and looked scrutinisingly at us.

'That's one of them,' whispered Murphy—'that's one of the boys that wants to get inside the house; but the captain is too 'cute for them.'

It seemed, from what the driver told me, that Captain Blake's affairs were complicated by a claim on the part of a rival family of Blakes, who were trying to gain possession of the Hall; and that, between one and the other, the captain had his hands full.

We were now sheltered from the brisk south-west wind, that had been bringing occasional showers upon us ever since we started; and emerging from my wraps, I began to look about me, for the moon was rising red and fierce over the woods. Then I first became sensible of a very strong smell of fish, that seemed to accompany us. 'It's the salt, your honour smells,' replied Murphy in answer to my complaint.

'It's a very fishy salt, then,' I rejoined.

'Well, there might be a trifle of herrings among it,' Murphy admitted; and on further arguing it seemed that he had taken up a box of red herrings at the station, which was destined for one Widow Maccabe, who lived somewhere in the barony for which we were bound. 'I knew your honour would not mind, being a poor widow, and the smell fine and wholesome—Whisht! what's that?' he cried.

From the wood close by arose a long protracted howl, that sounded mournful and uncanny in the stillness of the night. It was a howl of weariness and pain, that had something about it, too, appealing and monitory.

'Sure, 'tis old Challenger spaking to us from the kennels,' said Murphy, driving on again briskly.

We had gone half a mile, and had just cleared the second bridge, when a cluck, probably at the stables of Marrowinch, chimed out the hour—seven. Instantly, from the woods behind us, arose a tremendous chorus of baying and barking, so sudden and unexpected, that the noise quite unnerved me. There was a savageness and fierceness about the cries quite appalling.

'Poor bastes,' said Murphy, turning round to speak to me; 'tis feeding-time, and this is the fifth night they've gone widout their suppers.'

'Nonsense!' I cried; 'you don't mean to say they are not fed?'

'Divil a morsel since Monday night, barrin' a pair of old brogues some kind soul threw over the kennel wall. The captain can't get out to feed the bastes, and his innies won't.'

'Why, they must be almost wild with hunger!' I said, shuddering.

'Wild's not a word!' said Murphy; 'they're right down ranting raving mad wid it! Hark to the bastes!'

The clamour of those starving hounds was really fearful, ringing through the still night. But it suddenly ceased. There was a space of intense silence, and then arose a more regular and steady, and yet wild and ferocious cry.

'Bedad,' cried Murphy, pulling up his horse, and listening intently, 'the dogs is broken loose!'

After the first loud exultant burst, an almost complete stillness succeeded, with now and then a solitary yelp, that sounded fainter and fainter in the distance.

'God be praised!' cried Murphy fervently, 'they're running the trail backwards.'

'What trail?' I asked breathlessly.

'Why, ours.'

'And why should they follow our trail?'

'Tis the herrings they've got wind of, that's almost as sweet as a fox to them, bad luck; but, glory to the saints! we're out of the reach of them now, as long as they are running away from us.'

'But, is there any danger, really?' I asked, all of a tremble with excitement, and, I confess, a good deal of fear.

'Maybe they wouldn't pick our bones, if they come across us!' replied Murphy.

'Quick, then!' I shouted. 'Drive, man, drive; why don't you drive?'

'Whisht!' said the man impressively, leaning back, and holding up his hand—'whisht! while I listen. Ay, they've come to a check at the brook, where we crossed, and they're puzzled a bit, the bastes. Whisht!' he cried again in a voice that had a tremor of terror in it. The scattered cries of the dogs had ceased; one could imagine them listening intently with uplifted heads, as, in the deep quiet of the night, the mellow ringing challenge of a solitary hound quite near at hand awoke the echoes round about. 'Tis Challenger,' cried Murphy; 'brave dog! he's hit off the scent. Bedad, that's the beautiful dog of them all;' and springing to his feet, he whirled the whip over his head, and roared out in good hunting cadence: 'Hark to him! hark to him! hark to Challenger! Yoioioo!'

Murphy's enthusiasm had drowned all sense of his own danger; but for myself, I saw the position in all its horrors—nothing less than to be pulled down and devoured by this ravening pack, whose cries were every moment borne louder and louder on the breeze. With a perfect crash of voices, the hounds acknowledged the scent, but they were now pouring along almost silent, save for an occasional whimper. In a few moments they would be upon us.

'Drive on, man!' I shouted frantically to Murphy; 'get us to some house, some shelter. Go!' My voice rose to a husky scream; I was like a man overpowered by some deadly night-mare.

'Faith, it's very little use,' replied Murphy, calmly straightening the stump of his whip. 'There's no house near enough for us; it's the will of Providence.'

'Save me!' I cried—'save me! oh, you must save me! Dear Murphy, I'll do anything for you, if you'll get me out of this.'

'Let me see,' Murphy muttered to himself; 'ay, they'll check for a minute at the brook again.—Look here, your honour,' he said aloud, 'there's just one chance for us. The bog lies within a quarter of a mile of us, and once inside that, we'll baffle the bastes; but I'll not insure you from drowning in the bog.'

'Go on, Murphy,' I cried; 'anything is better than the hounds.'

At the word, he lashed up his horse, and started off at full speed.

'Bedad, we'll give them a run for it, anyhow,' he cried; and away we went, the cries of the hounds once more echoing loudly behind us. As Murphy had anticipated, they came to a check at the bridge, and the delay was vital. The inclosed country was now left behind us, and we emerged upon a wide desolate waste, bounded only by the horizon. The moon had now fully risen, and shone ghastly over the scene, revealing a huge dark morass, deep chasms where the winter's turf had been cut, black oozy pools, and quaking quagmires—a horrible place to traverse at night. I shuddered as our car left the rough road that bordered the morass, and ran noiselessly over the slaking, squelching turf.

'There's no scent will lie there,' said Murphy, shewing his teeth with an anxious smile, as our wheels sank into a watery pulp up to the hubs: 'howsoever, we're likely to touch the bottom of the bog this blessed night. See the dogs there beyant, your honour!' Sure enough, they were gathered at the margin of the bog, clamouring loudly at the loss of their anticipated prey.

To any one who did not know the bog thoroughly, a drive like ours would have ended in certain destruction; but Murphy threaded his way with wonderful instinct over all the sound places, and after half an hour of intense peril and excitement, we found ourselves upon a little knoll that rose like an island out of the surrounding bog. Here, at a heap of turfs, hardly to be distinguished from others scattered about, my guide stopped, and gave a low whistle. A door, before unseen, was opened suddenly, and a man's face appeared in the gleam of a shaded rushlight.

'Step in, your honour,' said Murphy, 'and rest while we're sure the bastes is out of the way.'

Gladly I sought the shelter of the cabin; after the intense excitement of the last hour, the revulsion of feeling was almost overpowering. I threw myself on the earthen floor in front of the fire of turfs, resting my head upon a three-legged stool, the only piece of furniture about the place, and fell fast asleep. I fancied I heard sounds about me of trampling and stirring, but I was too thankful and drowsy to heed anything. Presently, Murphy aroused me.

'All's safe now, your honour, and I know an illigant road over the bog that will take you to your friends in a jiffey.'

Once more we took to the car, and after a short drive we were challenged by a police vedette—welcome, reassuring sound!

A lamp was flashed in our faces. 'What have we got here?' said an authoritative voice. 'Oh, only Mr Supervisor and his car. Why, we've been waiting half an hour for you. You'd better take one of the trooper's horses, sir, as the track is a bad one.—Come, start off, Pat, with your car, and wait for the gentleman by the cross-roads.'

I did not enter into any explanation of the cause of my delay, but took my seat on horseback, and followed the column of police again some way into the heart of the bog. As we drew up opposite a little turf-hut, I recognised, with a start, the shebeen that I had just before quitted. In a few moments, the police had penetrated into a small subterranean chamber adjoining the cabin, that an informer had described to them as the illicit distillery. To our disappointment and disgust, nothing was found there to inculpate the inmates. The place smelt strongly of potheen, and there were certain indications that a still had lately been worked there, but nothing to secure conviction.

'Hollo! what's this?' cried a constable, kicking aside a heap of turfs, and revealing a small keg. Without more ado, the head was knocked in, and, behold, the contents were only red herrings!

When we returned, baffled and discomfited, to the cross-roads, where the car was ordered to be in waiting, nothing was to be seen of man or car, and my progress homewards was made very uncomfortably *en croupe* behind a constable.

Well, I had my own suspicions as to the cause of our failure, but I did not say anything about

them, for I didn't feel sure that I should gain any applause by revealing them. But a few days after, I mentioned the fact of the starving hounds having hunted me, to some gentlemen who were staying at my hotel. And it turned out that one of these gentlemen was the very master himself who had been in hot-water. He talked quite freely about the matter, for it seemed he had staved off the evil day, and was prepared to hunt the county once more. But he laughed at me when I talked of the dangers I ran, and assured me that the affair had been vastly exaggerated, and that though the hounds had broken loose one night, and harried a few pigs and sheep, yet that there was no danger to human beings; a fact I beg very much to doubt.

Just before I left the county, being transferred to another station, I met Murphy soon after. He pretended not to know me, but after a while he acknowledged that he was the man who drove me. He was very shy at first, but finding that I was leaving the county, and meant no harm by him, he suffered himself to be treated with some whisky, which presently unlocked his tongue. The truth of the matter was, that he was not the carman ordered to meet me at the station, but had come down on his own account, to pick up a little information—that being hailed by me, whom he recognised as connected with the preventive service, he had at once assumed the character of my guide, and had purposely dropped behind the constables, in order to give warning to some of his friends of what was in the wind—that the herrings were brought for the entertainment of the men who were working the still, and that, by the lucky accident of the hounds getting loose, and frightening me out of my wits, he had the opportunity of taking me to the very place we were in quest of, of hiding the still and tubs in the bog, and carrying off sundry gallons of potheen under the very nose of the excise, in a keg which he exchanged for the one of red herrings that had so nearly proved our destruction.

#### HORTUS SICCUS.

Gone, with their laughter and their silent sorrow;

Gone, with their weeping and their summer smiles;

Never to them will come a glad to-morrow,

Sweet with the dreams that many a day beguiled.

Gayness or sadness in their voices ringing,

Making one love them for the sounds they gave;

Sunlight or shadow in their pathway mingling—

All is now swept into the silent grave.

Nought but their shadowy memory remaineth,

Dim and uncertain through the lapse of years;

Nought their clear image in the mind retaineth,

Saving love's chain cemented by our tears.

Chain that is forged in furnace of our sorrow,

Links knit together by long-cherished hopes,

Infinite strength and beauty thus it borrows,

Strength and endurance with which nought can cope.

Through the soft gleam of many tinted fancies,

O'er their sweet memory such light is thrown,

Sadness divine and tenderness enhancing,

Darkening all other sunshine by its own.

## MORLEY FELL.

IN TWO CHAPTERS.—CHAPTER I.

IN the whole of Westmoreland there is not, perhaps, a more beautiful bit of scenery than the Vale of Waterthwaite, and yet there is no place in the wide, wide world which Harry Vernon, a few years back, asserted to me he cared less to think about, and yet which more engrossed and occupied his mind. There it was, however, that he occasionally had spent some of the happiest days of his school boy life, for thither, during both the midsummer and Christmas vacations, he was accustomed to run down from town, where his father drove a trade and prospered well, not 'in skins of cats,' but as a lawyer, to his old uncle, who not only kept a good table, but one or two good hacks, which Harry was glad enough to mount, when one or other of the packs of harriers was astir that were kept by gentlemen in the neighbourhood.

The little town or village of Waterthwaite, from which the valley takes its name, is comparatively little known, although several good trout streams, besides an average amount of good moorland for grouse, might induce many to take advantage of its natural resources, and there while away their brief holiday, gun or rod in hand. Rabbits also, as in most parts of favoured Westmoreland, abound; and so young Vernon, who knew how to enjoy most of the good things of this life, ought to have looked back with pleasure in after-time on the days he had passed at Waterthwaite. Indeed, for several years he could never say enough in praise of his pleasant trips down to Westmoreland, as many of his quondam schoolfellows could testify. But few indeed knew how a few hours changed the whole current of his thoughts, nay, the whole tenor of his life, from an incident that befell him during necessarily the last time he staid at his uncle's house.

Poor Harry! we were always chums, and to me alone he intrusted the sad story of his earlier life. The heat of India, where he was ordered with his regiment some years ago, finished him up; he

came home with a broken constitution, which quite seemed to give way, when, on seeking his father's house in London, he was met with the sudden news of his parent's death, which occurred a month previous to his landing; and almost at death's door, he confided to me the events of his past life, a life, once bright, suddenly struck down, and apparently now ebbing away into eternity. How deeply was I moved after hearing the tale I am about to relate! I first made Vernon's acquaintance at school, and as we were in the same class, consequently doing the same work, and also both in the first eleven, we naturally were thrown together, and acquaintance soon ripened into firm friendship. He was a tall, athletic young fellow, and his charges in football became a matter of history in the school after he had left. No one with a good heart could have helped liking him, though there were some half-dozen bullies who were glad to hear that he would not turn up again next half, but the school in general were grieved at his departure. He too felt sorry enough to leave the old place, where he had experienced so many pleasant terms; but go he felt he must, for his nineteenth birthday was close at hand, and it was high time that he devoted a year to hard reading with a private tutor before going in for examination, as, to tell the truth, he cared more for his bat than for his books when with me at Penford under good old Dr Williams. The half-year came to a close. On the morning following the breaking-up, Harry accompanied me to the station to see me off, as my train started about two hours sooner than the one which carried him to King's Cross.

'Well, old man, the best of friends must part,' I said, as I took my seat in the down train for Yorkshire.

'Ah! but I shall in a month's time be down at Waterthwaite,' he cried, as the train began to move off, 'and I will tell my uncle to expect you any time this holidays; you must come.'

With a promise that I would if I could, which, unfortunately, most unfortunately, I now believe, I was unable to fulfil, I retired from the window to the perusal of my penny paper. Little did

I imagine that the next time I saw him I should see quite a different being from the joyous young fellow who had just now parted from me. And, curiously enough, it was in another railway station that I saw him next, about a twelve-month after this, just for a few minutes. I was struck instantly by the great change not only in his face but in his general appearance; even his walk was not the same. To my anxious inquiries, he replied that he had not been very well; but I could see that something had happened, and that at the same time my questions seemed out of place, and painful to him. Although his manner was constrained, still the warm friendship he had previously entertained for me did not seem to have waned, and when I chided him for not writing, he said he hoped soon to have done with all book-work, which had kept him much engaged; and that, when once in the army, he was going to try to get to India, where 'you will be sure to hear from me all about tiger-hunting and pig-sticking, and all sorts of queer adventures.' I never got a line; and the first intelligence I had of his having actually gone out to India, and having returned again after a lapse of three years, was from himself, in a note scrawled in these words:

DEAR LAWRENCE—I daresay you have forgotten me, but if so, it's my own fault. I have just returned home from India on sick-leave, to find that my dear old father a month ago was committed to the grave. I am quite broken down; the doctors give me little hope of recovery; I feel it's true, and I'm glad of it. Do come up and see me, if you are still alive. God grant this may find you. Don't write, but come at once; do not disregard the wish of a dying man and your old chum,  
HARRY VERNON.

As you may well imagine, I was awfully shocked; and it was not until I was being whirled away by a fast express towards London, with a small portmanteau packed with such few necessities as I should require, that I was able to reflect calmly on my sudden and mysterious summons. I had almost forgotten my quondam schoolfellow, inasmuch as nothing ever served to call him to mind, except, perhaps, an old cricket-bat he had pressed upon me in days of yore, and which I never now handled. At first, when I used to look out for the letters that never came, I pictured him as a good type of the insincerity of this world; but for a long time he, of all people, perhaps, had least entered my thoughts. But now, as my mind dwelt on the strong and hearty young fellow, whom I had once so intimately known, the memories of old days flooded upon me. Again I felt myself at school; again I seemed to hear young Vernon's cheerful voice, and felt a glow of friendly exultation thrill through me as he 'drove hard to the off' for a sixer in an all-important match; again I heard his hearty greeting, and felt the hard squeeze of his hand, with which we always met again at school; and now, the tears started to my eyes, and all my old affection for him leaped up again within my heart. Never seemed a train to go more slowly, but at last there we were face to face. I don't know what Harry felt, but I felt as though I would, if I could, have given all in the world, and gone forth a beggar, to have seen him then as in former days, when he could always, either in boxing or wrest-

ling, lay me on my back. But now—his fine form wasted away, his features pinched, and limbs shrunk—he seemed as helpless as a baby. He started up in bed, as soon as he perceived me at the door, but sinking back again from weakness, he exclaimed: 'Thank God! thank God! I knew you would come; you are my old chum still.' Our emotion prevented more for the present. All through that summer's evening I sat by his bedside, and we talked about many things, although every now and then his valet, fondly attached to him, would make some excuse for entering the room, to busy himself about his young master's comfort, while he impressed upon us in earnest, anxious tones the necessity of keeping quiet, and not talking much, 'as it's agon doctor's orders, if you please, sir.' I forebore, of course, from asking if he had any particular reason for having so suddenly summoned me to his bedside, apart from the excuse of old friendship, and a feeling of loneliness, now that he believed himself doomed to die. I seemed intuitively to feel that he wished much to disburden his conscience of some sin, or ease his mind by some avowal, before the grave closed over him, and his secret perished with him. For this must be a terrible thought to the dying, that if words which they wish to utter are not spoken soon, it may easily be too late. How sweet a comfort is it, too, to have some one in this world, if only one, to whom one may with safety disclose the hidden trouble that, perhaps unnecessarily after all, fills the breast and pains the heart! Here, then, lay my poor old chum; and his secret, if he had one, I at once associated in my mind with the wretched and changed appearance which I had noticed in him the last time I had seen him, only a year after his leaving Penford. My conjecture proved right. Believing that I was the only true friend he had in the world—his mother, poor fellow, died in giving him birth—he, after much hesitation, had written to me in the manner I have described; and now, after apologising in a most touching way for his weakness, as he called it, in having given me so much trouble, he began to enlighten me as to the true state of his sad case. His story, however, I shall give in my own words, as frequently, from faintness and excitement combined, Harry was forced to stop in his narration. All his misfortunes occurred from that one unlucky visit he paid to his uncle in Westmoreland, at the close of his school career, and which he had pressed me to undertake with him. As I have said before, would that I had done so; I might at least have prevented some of the mischief. After spending, then, a month in town, he had, according to arrangement, run down to Waterhwaite for an indefinite period. Oh, how during the half-year had he looked forward to this visit! His uncle always received him with open arms, and in his uncle's house he not only felt at home, but, after the murky air of London, the pure fresh breezes of the country infused fresh life into his frame. But, what at that time I did not know, there was a greater attraction still. His uncle and aunt, like some others who have no children of their own, had about twelve years ago adopted and brought up the only child, a daughter, of a widowed lady, who, at the close of her earthly career, earnestly commended her little darling, then in her sixth year, to the care of those friends she had best

loved and trusted in her life. They not only accepted, but accepted with joyful pleasure, both the treasure committed to their charge and the responsibility connected with it. Here, then, was the greater attraction. A young lady in her eighteenth year, Maud Hamilton possessed in an eminent degree all those personal attractions and virtues, adorned with which woman has but to speak, and with man, to hear is to obey. The beauty of her face and figure were but equalled by the beauty of her temper and her mind. I will not go further into detail; suffice it that Harry thought her perfection, and I always thought Harry's judgment perfect. Poor Harry, with his frank and hearty manner, was not one to long conceal his love, not that anything had openly as yet been said, but that guardians of a treasured daughter are seldom blind. In point of fact, they had for some time past discussed the question, and agreed, that could they see these two united, they would have no anxiety about their darling's future when they themselves had gone. Between Harry and Maud, however, there was no anxiety, no misunderstanding, for Harry knew that if he could once obtain his aunt's and uncle's leave, he had no need to search her heart, for Maud, who, with woman's instinct, felt the depth and intensity of Vernon's love, that shewed itself in a thousand ways, found that she too at length could no longer call her heart her own. He had at last, and that, too, during this very visit, opened out his heart to her, and she in return had artlessly and simply told him all. As Harry said, that evening was the happiest of his life. How soon was the joyful dream to be dispelled, how soon the cup of sweetness to be shattered in his grasp!

It was a few days after this, towards the close of a brilliant August, that Harry one evening sauntered across his uncle's grounds, and then, with quicker steps, commenced a walk of one mile towards a small copse at the foot of Morley Fell, which towered up abruptly to the skies on the side nearest to the wood, although still quite passable by a young and active man, whilst, on the other, an easier slope made that side the one generally preferred by all who wished to gain the top, whence a varied and extensive view might be gained; and to those who know England, both Cumberland and Westmoreland certainly carry off the palm for such views of wild and glorious scenery as can be obtained from Morley Fell. Both the copse and a few surrounding acres, together with the steeper side of the fell, belonged to old Mr Vernon, and now his hopeful nephew was about to test a new double-barrelled breech-loader—one of the many instances of his uncle's kind and generous interest—upon the rabbits, that had had it all their own way at Morley Fell from time immemorial. Naturally, therefore, expecting good sport, he was much chagrined and surprised, after skirting two sides of the wood, and after vainly peering about for some ten minutes or a quarter of an hour, to find that, despite numerous traces of the little fellows, not a rabbit was to be seen. 'Somebody must be about,' was his muttered exclamation, as he plunged into the wood; and coming out, after a three minutes' scramble, on the other side, facing the fell, sure enough there sat a man, apparently tying up a ferret or two in a bag, whilst a powerful lurcher was regarding with interest some half-

dozen rabbits lying at his master's feet. There were not more than one hundred yards between them; and no sooner had Vernon advanced twenty paces, than the dog sprang to his feet with a deep growl; not less speedily did the man seize his string of rabbits in one hand, and a stout cudgel in the other, and spring over a low stone wall close at hand, followed by the lurcher, where he turned round to see the extent of his danger. Apparently satisfied that there was not much, as he saw but one man after him, and that not a keeper, he threw down his rabbits again, and calling his dog close to his heels, awaited Harry, who, excited to greater wrath by seeing the fellow flee, a fact which at once stamped him as a trespasser, had put on a regular spurt to come up with him, and now arrived at the wall somewhat puffed, and in anything but a good humour.

'Holloa! you fellow, what are you doing here, giving me all this bother? What do you mean by it? Do you know you're trespassing?' he jerked out.

The 'fellow,' a powerfully built and ruffianly looking vagabond, evidently puzzled what to answer, grasped his stick all the tighter, and then growled out: 'I wasn't a-medlin of you.'

'Confound you! I never said you were. What's that got to do with it? You're trespassing; you know you are. I'll see about this. What's your name?'

'My name, be darned!' shouted the fellow. 'What's yours? What reet have yer a-coomin' about more an me? I've gotten these ere rabbits, and I means to keep 'em,' he added, as he once more laid hold of them, and seemed about to depart.

'Drop them!' roared Harry, as he mounted the wall. 'If you take a single rabbit'—

'If yer tooch ma rabbits, Sandy shall throttle yer,' roared back the villain with equal energy.—'Hie at em, seize em, my lad Sandy!' he cried again as Harry sprang from the wall. There were only a dozen paces between them now, when the savage beast, without any warning, sprang with the fury of a maniac from its master's side at Harry. It was all over in a moment. A puff of smoke, a sharp crack, and there they stood, a remarkable picture. On one side was Harry, his piece presented full at the man's head; on the other was the poacher, literally rooted to the spot with fear, anger, and amazement combined. Between them lay the ferocious Sandy, breathing out his last gasp, shot right through the heart. How like Vernon it was! His boldness and decision did not desert him at a pinch like this, and I believe really saved his life. Harry said afterwards: 'Pluck? Oh, it wasn't pluck; I did it without thinking of it.' But it is just that pluck, in my estimation, which shews itself how, when, or where, as occasion requires, and which is not wanting in the hour of need, which I really call pluck.

'By —, thou shalt pay for this!' at length cried his opponent, advancing a foot, and swinging his club.

'Another step, and you are a dead man,' now came in hoarse but earnest tones from Vernon's mouth. 'You would kill me if you could,' he added; 'and I shall shoot you just as I've shot your dog, in self-defence, if you don't take yourself off immediately.'

Completely cowed, not only by the words and determined voice, but more, perhaps, by the

whole attitude and unflinching eye, which threatened him with instant death, the fellow immediately backed a few paces, and sloping off until out of range, he only halted to shout out some bitter oath, before disappearing altogether in the distance. Harry turned to examine the dog for a minute, 'tremendous still in death,' and thought of the little chance at close quarters he would have had in a struggle with such a beast, especially when a strong ruffian was by with a stake to give him no gentle tap on the skull. He then skirted the wood towards home, and getting one shot at a rabbit, of course missed it, for his nerves were, to tell the truth, a bit shaky now that all was over. On the whole, however, by the time he got to his room, he felt rather merry at the thought of what the good people would say about his adventure at the dinner-table; and at dinner he did tell his tale, and laughed heartily over it; but even his uncle scarce saw much to laugh at; whilst one of the ladies—Harry was rather pleased than otherwise to observe—turned very pale indeed. That very evening also, Mr Vernon despatched a keeper to the place, to see if he could identify the dog; but although the man searched diligently, neither dog nor rabbits were to be found, only a deep crimson patch upon the grass where the scene had evidently occurred.

One week passed away, and Harry, at first really anxious to have a second interview with the savage who would have made such short work of him, had already twice visited the wood in company with the keeper; and his uncle too, out of curiosity to see the spot where the encounter had taken place, had once made one of the party. Three weeks passed away, and with them all recollection of the affair, and Harry, shouldering his gun, once more found himself, towards the close of a September day, on the outskirts of the wood, determined, if possible, to give the rabbits a warm farewell before he returned to town. There were several rabbits out on the feed, and as he sauntered along, getting now and again a really good flying shot at the little beggars as they scuttled towards the sheltering furze, he thought he had never enjoyed anything more, never seen a more glorious sunset, and reflected with regret that this would be the last of his pleasant solitary strolls which he so much delighted in, and which it would be impossible to get elsewhere. Having at length exhausted his stock of cartridges—not anticipating much sport, he had not burdened himself with many—and having strung up his rabbits by ones and twos to convenient trees, intending to send a boy for them in the morning, he paused on the other side of the wood, and gazing rather sadly upon Morley Fell, he thus soliloquised: 'Once more, and now for the last time, do I behold thee! Suffer me but to climb thy shaggy brow, and view around the scenes I love so well. Would I were thee, old fell, to keep a watchful eye upon my darling Maud!' Arousing himself from these and such-like thoughts, and refreshed by the idea of a little muscular exertion, he began to climb, but had not ascended twenty feet, before, with a start and a sensation of nervous apprehension, he glanced rapidly upwards and then around, but nothing seemed to stir but his heart, which beat violently. 'Bah! what a coward I am; I must have been thinking of that affair here before.'

But no; his instinct, as is often the case, was right, and he was wrong. He does not see the danger just at that moment, concealed as it is by the old stone wall, but none the less real danger is menacing him, and now will he have need of all his pluck, of all his cool decision. Had he perceived and understood the peril which was creeping fast upon him, he would not now have stopped to examine that fern peeping from out a niche in the rock, nor plucked the prettiest frond for some one he was so soon to leave. Look how he loiters! will he see his imminent danger in time to avoid it? No; heedless, and with thoughts fixed far away, and mind intent upon the future, he saw not, heard not.

#### A PLEA FOR THE OTTER.

DUMB animals have a great deal to contend with; they can neither rebut nor answer accusations. Too frequently it happens that the 'intelligent gamekeeper' has only to express an opinion of the destructive character of any living thing, to obtain, from his master, *carte blanche* to go forth and destroy that living thing. In this way many comparatively harmless animals have been persecuted to the verge of scarcity, and the vermin which they usefully preyed upon have consequently increased to become a deplorable grievance. It is, to say the least, a dangerous task to meddle with a link in Nature's chain, every one of which is impressed, more or less, with its mission of binding and strengthening the great order of the universe. But when the fiat of extermination goes forth upon the really innocent, it is the duty of the humane sportsman to hold his hand, and the enlightened naturalist to enter his protest against such descriptions of animal slaughter. At the present moment, happily, a change of feeling is taking place with regard to the otter, an animal which has been from time immemorial charged with fatally grave offences. It has been alleged that he not only kills fish, but makes raids upon the farmyards far inland, to feed on poultry, rabbits, and sucking-pigs, and that he will even hunt wild-fowl, and help himself to a young lamb or kid. Now, there is no proof of any of these charges beyond the otter's natural appetite for fish; and circumstances, lately brought to light, almost conclusively shew the utter improbability of his feeding either upon flesh or fowl, in his wild state.

One of the oldest and most observant of trappers affirms that he has frequently seen otters swimming amongst wild-duck, teal, and widgeon, without their molesting the birds, or taking the slightest notice of them beyond giving them room to pass. So assured was he of this fact, that he says: 'I went one evening and took a man with me who is now living. We sat down by the river-side. Being almost dark, the otter came swimming along the stream, which was not above twenty feet broad; and though it was covered with geese, ducks, divers, &c., yet one of them did not rise on the wing; they only opened in the middle of the river, and the otter came swimming through them, as if a frequent visitor; and when he came to my gun's end, I shot him.' With a view to ascertaining whether or not the otter has a partiality

for meat, a friend of ours opened some hundreds brought to him for the purpose, the result of which went to prove that they touch nothing but fish in their natural state. The truth appears to be, that as the otter gives great 'sport' to numbers of every degree, by its instinctive cunning in eluding the dogs, and when beset, its indomitable pluck in holding on to them with a formidable gripe, and carrying them under water torn and bleeding, such attributes are woven into the charge of an unjustifiable ferocity deserving of punishment, not short of torture by impalement alive.

Men, however, who might be supposed to be the last to have a good word to say for the otter, are now boldly coming forward in its behalf. Not mere 'humanitarians,' contemptuously so called, or sentimentalists, but anglers, owners of salmon-waters, and secretaries of river preservation societies. That the otter does kill an occasional salmon, taking a mouthful from it, and leaving it to the next comer, perhaps a poor cottager, cannot be gainsaid; but the labourer is worthy his reward, and is a most useful one, if, as is now strenuously maintained, he does immeasurably more good than harm in keeping down the generation of eels, almost his especial and favourite food; for eels eat, as soon as deposited, the valuable ova of the salmon.

The otter is an extremely graceful creature, and its habits are interesting; but it is most to be admired when watched in clear water swimming and tacking in undulations by the aid of its tail as a rudder, and surrounded by three or more of its young. It has been compared in form to the polecat, but this is not a happy simile, as its head is more blunt, its fur shorter and thicker, and its feet webbed. It is amphibious in its habits, but if kept under water more than a few minutes at a time, is soon drowned, for to live, it must come up to breathe. It is not so famed in architectural skill as the beaver, but it must be remembered that much that relates to the beaver's residence is fabulous. When in full growth, it is about two feet in length from the nose to the tail, which is of itself fifteen or sixteen inches long, and tapers to a point; in this particular, differing from the sea-otter, whose tail is much broader. In colour it is a deep brown, with a light patch on each side of the nose, and one also under the chin. The throat and breast are ash-coloured, the mouth small, the lips furnished with strong moustaches, and the ears short and rounded. The eyes, which are diminutive, and placed near the nose, have a somewhat vertical aspect, which enables it to detect fish while lying below them on the bed of the river. Its neck is thick; the legs are thick, short, and very mobile in their articulations, enabling them to act with all the ease and effect of fins in the water, in which they have great power, as well by the flexibility of their joints as by the strength and muscularity of their members, and also by the close webbing of the toes, which, extending down to the very point, give them great power in swimming or diving. The otter evinces great sagacity in the construction of its dwelling. It burrows under the banks of streams or lakes, sometimes for a considerable distance, and always makes the entrance of its home under water, working upwards to the surface of the earth, and fashioning three, four, or more chambers, which ascend

from one to the other. Nor does it neglect the important consideration of ventilation, as the interior atmosphere would vary in density as the water rose, but makes a few minute holes for the admission of air, generally contriving that these apertures shall be concealed by the gnarled roots of the stump of a tree, or a thick bush. The female is often followed in the season by several males, and the fights of the latter are desperate, often fatal, but they are said never to utter a cry under any circumstances, although the female does occasionally give a shrill kind of scream, particularly when with young. She has sometimes five at a birth, which takes place in a warm chamber or 'couch' deeply lined with moss, where she rears her little ones with extreme affection, assiduity, and caution; for it is seldom they are discovered, although often sought for. Numberless instances, despite of what has been said to the contrary, might be adduced of the extreme fondness of the mother for her young, in defending which, in many instances, she has been known to lose her life. When her progeny has been caught, and kept in captivity, she has been seen to visit them, taking them fish, and at length encompassing their deliverance by tunnelling from some secret spot to beneath their prison.

There is no authenticated evidence of the otter attacking man or dog, as some have alleged, excepting when grievously driven to bay, and then only when attacked, and in self-defence, while its attachment to man, if kindly treated, is so well known as not to need further confirmation. 'We are surprised to find any writer,' says Blaine, 'questioning the capability, not only of taming the otter, but also breaking him to fish-hunting, fish-catching, and to a faithful delivery of those he takes. Very many well-authenticated accounts of this aptitude are on record.' An interesting one is related by Bishop Heber, who, when in India, saw a number of otters, which, being stationed along the edges of the water, were made use of as hunters of the fish, which they pursued so adroitly as to drive them into the nets, and there only. To shew that they perfectly understood what was required of them, we are told by the bishop that they laid hold on the largest, and brought them ashore. Thus has the otter, like the dog, been made a valuable and obedient servant. Buffon details the habits of a female otter which had been reared on milk until it was two months old, when 'it was afterwards so far led by degrees and necessity to partake of soups, fruits, pulse, animal food, and fish; but which last, in accordance with its original nature, it persisted in rejecting if not fresh. It was as tame as a dog it played and ate with, came when called, but was furious against any strange one which approached it; a dislike it may have learned from its canine companion. It is curious to add that, with its newly acquired taste for a variety of food, it had no piscatory talents, having lost its natural habits thus far in its early domestication; indeed, it would not willingly even enter the water.'

The readers of the *Complete Angler* will recollect that Walton makes Venator, Hunter, and Piscator ask whether the otter is a beast or a fish. Hunter observes that he heard the question debated among many great clerks, and they seemed to differ about it; yet most agree that her tail is fish.

And he continues: 'If her body be fish too, then I may say that a fish will walk upon land—for an otter does so sometimes, five, or six, or ten miles in a night, to catch for her young ones, or to glut herself with fish.' If the otter be fish, it can of course be eaten on *maigre* days. Mr Pennant says that he actually saw an otter preparing in the kitchen of the Carthusian convent, near Dijon, for the dinner of the monks. Those who have tasted the flesh of the otter, however, consider the eating thereof more as a penance than a treat, for its rankness requires the strongest piscivorous appetite to masticate or swallow a morsel. But we are glad to find there are people abroad who like the otter in any shape.

It has been recently attempted to justify the use of the spear in otter-hunting by its being the instrument with which the otter is *at once* put out of its misery. But this far from agrees with what we have seen and shuddered at. The poor animal has been transfixed completely through its intestines by the instrument, 'from which'—and we quote a work upon otter-hunting—'it is impossible to escape, as the spring-catch opens after penetrating the animal, and the toughness of its hide effectually prevents his releasing himself from it.' The otter is then held up in writhing agony. But that we may not err at a time when these practices are so energetically denied, we will again quote a recognised authority: 'Many casts with the spears, as may be supposed, are therefore made at him without effect. In the meantime, it is not uncommon for the dogs to seize him, and he is then bitten to death; yet not until he has imprinted some serious, and not unfrequently fatal wounds on a dog or two. Although the otter may be bitten, and bitten to death, it is but seldom he is broken up, except to be left exposed to the fury of the hounds, for a considerable time. In all other cases, such is the tenacity of the hide, that it is impenetrable to the common bite of even these vermin-biting dogs. Among the most energetic otter-hunters it is, however, the wish of each to signalise himself by piercing the game with his own spear. It is truly surprising to see how effectually the well-practised sportsman at this chase wields this weapon, in many cases delivering it in such a manner as to pass directly through the otter, and fix him either to the bank, or otherwise to the bottom of the river, from which, however, his dying efforts usually release him. But from the barb-spear itself no exertions can free him, as the barb, or barbs, form an insurmountable obstruction to its extraction. The spear is then recovered, the otter raised on high, and amidst the shoutings of the men and the barking of the dogs, he is thrown to the pack, and left to their mercy.' Are practices of this kind anything short of atrocious cruelty?

Should these authors be considered to deal in exaggeration, we would refer to the works of our artists, generally faithful in their delineations of field-sports, who, at the heel of the hunt, draw the otter raised as above described, writhing in its prolonged death-throes, and biting the spear in its frenzied agony.

An enthusiastic writer upon field-sports tells us that all animals possessing a mephitic nature are designed by nature to be hunted by dogs! This, however, need only be noticed to be dismissed. We have attempted to shew that the otter is a harmless creature, more sinned against than sin-

ning; the helpmate even of man if kindly treated, and which some of our leading water-farmers are willing to confess, is necessary to the welfare of our streams, as aiding in the maintenance of Nature's unerring balance.

## WALTER'S WORD.

### CHAPTER XLV.—LEAP-YEAR.

It was already dusk as Walter and Santoro crossed the camp, and where the few trees grew, the light was so feeble that faces could scarcely be discerned; it was more, therefore, by the stature of Joanna than by her looks that Walter recognised the sister of the brigand chief, as she received him standing in the shadow of some beech-trees. Santoro, in obedience to a gesture from his mistress, had at once withdrawn, and they were quite alone.

'I have sent for you, Signor Litton,' said she, in a strange and trembling voice, 'to say what it does not become a woman's lips to say, though it delights her ear to listen to it. The peril in which you stand, the imminence of it, and—something in my own heart, must plead as my excuse: I love you!'

The fact was not certainly unknown to Walter; but the confession of it, made thus abruptly, and under such abnormal circumstances, astounded him—perhaps with that amazement with which an English marriage service credits young persons of the opposite sex. Having heard thus much, he did not doubt that the proposition hinted at by Santoro—that he should save his life by wedding Joanna, while at the same time adopting her profession—was about to be made to him.

'Joanna'—he began.

'Pray, let me finish ere you answer me,' interrupted she, in the same trembling tones, but with an earnest pleading in them that gave them force. 'It cannot be but that you scorn me at the outset, but I can bear your scorn, since it is for your own sake that I provoke it. From the first instant that I saw you, I became your prisoner, though you were mine; my woman's heart acknowledged you its lord; the courage you have shewn, the honour you have exhibited, it took for granted without trial. I should have known them, had I died that moment, as well as now, when they have been proved so gallantly, and at so great a sacrifice. When I shewed you the secret of our cavern, and bade you depart, if it so pleased you, it was but a girl's artifice to shew her trust, for I felt that I ran no risk of losing you that way; and later, when I became, as it were, bail for your returning hither, though it pained me to see you go, I knew you would return and redeem your promise, as certainly as I know it to-day. O signor, what was it but love that told me so! Here, in my bosom, I keep the picture that you drew of my poor self; but nearer yet, and within my heart, is your own image, and will remain there to my dying day, though that indeed will be soon, if you die. Oh, why'—here her voice grew passionately earnest, though her tone was little above a whisper—'should we speak of death, we two, when it can be averted from us both!'

'I see not how, Joanna,' answered Walter gravely.

'Ah, but I can shew you how. For your sake, I am content to give up—it is not much, you will say, but it is all I have—my place among my people, and its power; to exchange this free air and untrammelled life, for an existence that must needs seem cramped and submissive; my native land for yours; if only you will let me call you mine! Oh, do not scorn such love!'

She stopped for an instant, overcome with emotion, and Walter said: 'I do not scorn it, Joanna.'

'I thank you, signor, even for that much of kindness,' continued she submissively. 'I pray you hear me out. Corrali, look you, though he is black in your eyes, is my brother, dear to me as the only kin I have, and one who has avenged my wrongs; yet, to wed you, I will desert him, returning evil for good. I have no bent for this dishonest life; my hand is free from blood, and it is yours if you will but please to accept it. I cannot flatter myself, alas! that you would do so, if you were free to choose, but since it holds your life in it, signor, my love may help to make it worth your taking.'

During the latter part of Joanna's appeal, the passionate eloquence with which she had at one time urged it had quite failed her, though the plaintive tenderness still lingered. Doubtless she read in Walter's face not only that her love was unreturned, but that it could never be so. Or perhaps the humiliation of having to offer so huge a bribe, for what she would have vainly obtained without the asking, quenched all her natural fire. This despondent pleading, however, by no means lost her ground with him to whom it was addressed. Walter had, it is true, no love to give her; but he had pity, which is said to be akin to it; and gratitude, which tends towards it; while, above all, the natural desire for life—life almost at any price—was pulling at his heart-strings. If he should promise to wed Joanna, he would hardly be forsworn, since to the girl he would have wed he was already dead—or would be so in a few hours; marriage with Lilian was an impossibility; then why not save his life, by marriage with Joanna? Men marry every day without affection, to gain much less; nor in his case—a mere Bohemian without kith or kin—were the social objections to such a union—stupendous as they would have been with some men—by any means unsurmountable. The only member of society who was likely to have any voice in the matter—namely, Jack Pelter—would probably hail with enthusiasm the addition of a female brigand chief to their *ménage* in Beech Street; or regard her at worst as a gratis model of the Salvatore Rosa class, and an admirable addition to the establishment. These thoughts, practical and even humorous, flashed upon Walter's brain, in spite of himself, though death was hovering over him, and genuine if misdirected love was demanding a final answer to its appeal. But they came and went in a second of time, and left him calm and steadfast. As to purchasing his personal safety at this price, or any price, that, had it stood alone, would have been his own affair, to be settled with his own conscience. He was not so quixotic as to hold Lilian's love as plighted troth, when death itself had put in, as it were, a priority of claim to him; in any case, he could not be Lilian's, and therefore it was unreasonable that he should accuse himself of faithlessness in wedding another. But there was a feature in this case which made it easy

indeed for him to come to a just decision. How was it possible for him to return to Palermo a free man with such news as he would have to bring with him? Could he tell Lilian that he had saved his life, on the condition of marrying Joanna, but had left her father to perish by unheard-of tortures at the hands of men made still more furious by his own escape? Would not the twofold woe be her death-doom, and the life he had thus basely purchased for himself, become intolerable, from shame, as that of Sir Reginald himself? He had not the shadow of a doubt of it, and therefore no hesitation as to what it became him to reply.

'Joanna,' said he, 'so far from scorning the love which you offer me at so great a sacrifice to yourself, I am deeply sensible of it, and thank you for it with all my heart; but the last words spoken by yonder unhappy man: "Do not leave me, Walter," and which are still ringing in my ears, have greater force than even those which promise me life and liberty. I cannot accept these gifts, for they would be worthless to me, since they would have been purchased by the desertion of my friend.'

For a full minute Joanna was silent; then she took a step towards him, and laid her hand upon his shoulder. 'Walter,' she said, 'rather than lose you I will save your friend. It will be difficult, and very dangerous, but I will do my best to do it. I had promised to desert my brother, though you will not desert this man, who is not even of your blood; but I will do yet more—I will play Corrali false, and rob him of what he holds to be his just revenge. For your sake, and to win you for my own, I will become a traitress. This very night—nay, within this very hour, for we have no time to lose—I will place you both in safety, if you will pass your word to be my husband. Oh, what can woman's love give more? Hark!'

Through the stillness of the night was heard the firing of musket-shots at a great distance. 'Yonder Corrali speaks. He will be up here shortly, wild with rage and loss. No power of mine will then avail to save you. Quick, quick! give me your Word!'

Again a torrent of contending thoughts swept through Walter's brain. The circumstances in which he was now placed had become strangely altered. If Joanna could carry out her present offer, Lilian would lose indeed her lover (though not, alas, his love), but she would at least have left to her her father. It would be no longer for his own sake, but for hers, that he would become another's. His hand he could not offer her, but in its place he would give her her father's life.

Again was heard a dropping fire of musketry, but the sound was more distinct. The combatants were evidently coming nearer.

'Walter, your hand?' whispered Joanna eagerly; 'in a few minutes more it may be too late.'

'I give it you, Joanna. If you will save the old man's life, I promise to make you my wife.'

Never surely was betrothal made under circumstances so ill-assorted and inapt; nor was there one moment to spare for its tender ratification.

'Santoro, Colletta,' cried Joanna in loud and commanding tones, 'let both the prisoners be fast secured.'

This was done at once, with ropes that bit into their arms; and helpless as infants, Walter and Mr Brown were placed side by side upon the

ground. The brigands crowded round them with wrathful and excited looks, which the noise of the firing had doubtless evoked; they imagined that vengeance was already to be taken upon their wretched captives.

'Corralli is beset down yonder,' exclaimed Joanna, 'and we must send him succour. Now these men are bound, we women are their masters, and can be left to guard them. Let each take his musket and do his part; and when it is done, you will find us here in charge.'

There was an instant of hesitation, but used to the habit of obedience, the men moved to where the arms were piled, and each one took his weapon. Santoro alone remained standing beside the women.

'Get you gone, Santoro; it is you who will be in command till you join my brother,' said Joanna imperiously.

'No, signora; I remain here at all hazards,' answered he in low significant tones.

'You disobey, then, my express orders?'

'For the present, signora, yes. I venture to think the captain would wish the prisoners to be left with a stronger guard than yourself and Lavocca.'

'If you remain, you will do so at your peril.'

'That I quite understand, signora. Corralli will decide when he comes up the hill again as to which of us was in the right.'

By this time the band were ready to march, and, in their presence, all controversy was to one, at least, of the disputants out of the question.

'You will obey Colletta, men, till you fall in with the captain,' said Joanna steadily; 'upon second thoughts, I will keep Santoro to guard the camp.'

'Good!' exclaimed Colletta, who was well content to find himself in the unwonted position of commander. 'There is no knowing what prisoners may not be up to.—Now, then, my fine fellows, step out.' And off started the brigands at their 'double,' which was a run about twice as fast as that used by regular soldiers, and, of course, without the least pretence of order, which, indeed, the nature of the ground would itself have rendered impossible. Santoro watched them disappear, then with a grim smile turned round upon Joanna: 'It was well schemed, signora; but I am not quite such a fool as Lavocca has doubtless represented me to be.'

'On the contrary, Lavocca has always spoken well of you in that respect. "You have plenty of wits," she says, "but, unfortunately, no heart."

'No heart? I, who love her with all my soul, and would lay down my life for her!'

'Oh, she has heard you say that, doubtless, perhaps a thousand times. But when it comes to the proof of your affection, then it is that you are found wanting.'

'Begging your pardon, signora,' answered the brigand, reddening, 'and with all due submission to you as Corralli's sister, you are speaking what is not the truth.'

'You talk of submission, and yet you remain here in defiance of my orders!' returned Joanna contemptuously. 'You talk of love, and yet it was Lavocca's wish, as well as my own, that we should be left alone here!'

'Ay; to let those birds yonder out of the cage, or, at all events, the one that, to your ear, seems to sing so sweetly. You would doubtless find your

own account in such a plan, signora; but what advantage would it be to Lavocca, who would only share the transgression and the punishment?'

'It is love, then, and not duty, that keeps you here, Santoro?'

'It is both, signora,' answered the brigand, smiling, for, at a sign from her mistress, her companion drew near, whose presence to his rugged nature was as the sun that daws from a barren soil unlooked-for signs of graciousness and fertility: 'it is duty to yourself, and love for Lavocca.'

'Then what I have now to ask of you, Santoro, will be easy to grant,' continued Joanna. 'It is my intention to set loose these captives, and lead them to Palermo. You may oppose it, of course, but it will be at the loss of one of our two lives; and if you should kill me, you will not find it easy, I think, to win Lavocca.'

'I would not marry him, if he did, though there was not another man in the world,' interposed Lavocca resolutely; 'I would even rather marry Corbara.'

'She would marry Corbara!' exclaimed Santoro, lifting up his hands, as if in appeal to universal nature against an idea so monstrous.

'But, on the other hand,' continued Joanna, 'if you will come into our plans, and assist us to escape, Lavocca will marry you as soon as we set foot in the city. A free pardon will easily be obtained for us, in consideration of this service to the Englishmen.'

'And your brother would flay us alive before the week was out,' interrupted Santoro.

'If he caught us; I don't doubt that in the least,' answered Joanna. 'But mind yonder will place you on board his yacht, and you will never leave it, until you and your wife are landed in England, where he will provide for you handsomely. Of course, there will be danger in getting down the mountain; but if you will not run some risk to win Lavocca, you, who were talking about laying down your life for her'—

She did not finish the sentence, because Lavocca had with the most opportune judgment precipitated herself into her lover's arms, and he was covering her comely face with kisses: the noise they made, however, was so very slight, that Joanna felt justified in taking it for the silence that gives consent. 'Come, come,' said she; 'you will have leisure enough for that to-morrow. You must earn your reward, Santoro, before enjoying it!' Yet, nevertheless, she left the fond pair together while she flew across the camp, and with a sharp knife cut the ropes that bound the prisoners, at the same time whispering a few words into Walter's ear.

'Is it then come at last?' cried the old merchant feebly: 'is death awaiting us?'

'No; life and freedom, if you have only the courage to take advantage of the opportunity,' replied Walter. In the excitement of the moment, he had almost forgotten the price he had agreed to pay for them, and had bounded to his feet like a deer. 'Give me a weapon, Joanna.'

She drew a pistol from her belt, and gave it him. 'Santoro yonder is on our side, dearest, and will lead us down the mountain. If we part again, it will not be your death alone that will separate us, but mine also.'

He answered, not with the caress which perhaps she expected, but with a silent pressure of his hand.

## CHAPTER XLVI.—THE ESCAPE.

In a few minutes the whole party had left the camp and plunged into the shadow of the trees that thickly covered the mountain, and which at that hour as effectually concealed them as though the earth had swallowed them up. The foliage, however, was intermittent; large spaces of exposed ground had presently to be crossed, where the dusk of a Sicilian night afforded them but a scanty cloak; and when this happened, Santoro and the two women walked in advance, that their dress might deceive the eyes of their late comrades, and cause them to be taken for a portion of the band under Colletta. They were only too likely to fall in with some of these, since it was the brigand habit when entering into action to scatter in pairs; though, on the other hand, this might enable the fugitives to overcome opposition. Having once embraced their cause and his Lavocca, Santoro could be depended upon to fight for them, and, indeed, he had gone too far to render return to his original allegiance possible. His untiring step fell as noiselessly upon the rock as on the turf, his keen eyes roved from tree to tree with unceasing vigilance, and, though the night was cloudy and their way without a path, he never lost the true direction of their course; only, when shots were heard, he would stop and listen, and turn to the right hand or the left, in order to avoid the combatants, from whose neighbourhood they were still, however, at a considerable distance. Three out of his four companions, albeit two were women, took step for step with his own; but for the fourth—Mr Christopher Brown—the whole party had not seldom to halt, while he panted for breath, or begged for a drop of water to quench his thirst. His age and constitution were but ill fitted for a night-march of such speed and duration, and, moreover, the terrors and privations of the previous fortnight had much enfeebled his frame. In his own mind, Walter felt but too sure that in case of their having to fight their way, the poor merchant must needs succumb to adverse fate, and would never survive to enjoy that liberty which he had so loyally striven to procure for him.

They had descended about two-thirds of the mountain, and, consequently, had reached what was the most dangerous part of the journey, namely, the locality where, in all probability, the brigands' line intervened between them and the troops, when suddenly 'the call' was heard very soft and low, immediately in front of them. Walter and Mr Brown, who were just issuing from a copse into an open space, at once stepped back among the trees; but the three others, who had advanced farther, and whose appearance had doubtless evoked the signal, moved boldly on, Santoro, with admirable presence of mind, at the same time giving back the answering note. The next moment they were confronted by Corbara. Of all the band, next to Coralli himself, this man was the most to be dreaded; for not only was he a most determined and relentless ruffian, and possessed of vast physical strength, but he was especially hostile to Santoro. On the other hand, he was probably unaware of the succour sent by Joanna, and would, therefore, not be so suspicious of her presence as if he had known she had been left in charge of the prisoners; and what was

also hopeful was, that he appeared to be alone. Santoro, who had already loosened his pistols in his belt, would have shot him down at once, but for fear that he might have comrades near him; and the most bitter repentance that he had ever experienced seized his soul because he had parted with his knife to Walter.

'Ha! Santoro, how comes it that you are down here?—and La Signora 'also!' Here he stepped back with a movement of suspicion. 'What has caused you to leave the camp?'

'We are come to help my brother,' answered Joanna coolly; 'the firing came so quick that I felt he must be hardly pressed.'

'He is only fighting because he likes it,' answered Corbara gruffly; 'for my part, it seems to me that there is blood enough to be spilt for the present, without losing our own in return.'

This was a reference, as Joanna well understood, to the promised fate of the captives, and in her ignorance as to whether they were not even at that moment within sight of the speaker, she felt that her presence of mind was being tried to the uttermost; fortunately, her nerves were like her muscles, strong as steel.

'I hope there has been no loss amongst us?' inquired she earnestly.

'As to loss of life, I don't know, though, when there are bullets singing about our ears as plentifully as birds in June, it is more than likely; but I for one have lost blood enough.'

'Well, here is she who will bind up your wound, Corbara, and give you more comfort than the best surgeon in Palermo,' and Joanna signed to Lavocca to approach the lieutenant. As she did so, Santoro whispered: 'Your knife, your knife!' and the young girl slipped it into his hand as she moved past him towards his rival.

'It is but a scratch in the right shoulder, my dear,' said Corbara, in a tone which he intended to be tender; 'and if you have got a handkerchief — What's that?' A piercing cry broke from the covert from which they had just emerged, and almost at the same moment a groan from Corbara, who staggered and fell forward on his face; a blow from Santoro's knife, struck between the shoulders, had cloven his heart in twain.

'Hark, hark!' cried Joanna; 'there is mischief behind us; see to Signor Litton.' She was herself the first to reach the spot where she had left Walter and his companion, and where were now three persons. The youth Colletta lay on the ground, felled by the butt of Walter's pistol, though not before he had uttered a cry for help, which was already answered to left and right of them; they could even hear the noise of men forcing their way towards them through the brushwood.

'Quick, quick!' cried Santoro; 'straight down the hill every one of you.' And all five ran forward together, though it seemed that such a movement must cast them into the very arms of their foes. Again and again a sheet of flame flashed out upon them, and one at least of their number toppled over. It was not Mr Brown, Walter knew, for he was holding the old man firmly by the arm, and helping him on, as a father helps his child to keep up with his longer legs; and it was not Joanna, for she never left his side, and at each flash seemed as though she would have interposed her own lithe form between himself and

the bullet. Thus they held on their headlong way for a considerable time, when the old merchant suddenly fell exhausted on the ground, with the last breath he had to spare bidding Walter leave him to his fate, since another yard he could not run. Then, for the first time, they missed Santoro. The noise of the firing had ceased; there were no signs of their pursuers; and the gray dawn was slowly breaking over the eastern hills. Yet self-congratulation was by no means the prevailing feeling with their little band.

'Where is he?' cried Lavocca wildly. 'He was close behind me all the way, and again and again bade me be of good courage. If he has fallen into their hands, I will avenge him yet!'—and the determined girl had actually begun to reascend the mountain, when Joanna seized her arm.

'He is not in their hands, Lavocca, but with the saints, I trust,' whispered she tenderly; 'I saw him leap into the air, ten minutes back, killed by a bullet through his brain.'

'You saw him die, and yet you ran on? Oh, cruel, cruel!' cried the unhappy girl.

'What aid could we have given him, dear Lavocca? Would you have had us make the triumph of his murderers still greater by becoming their prisoners? His dearest wish, if he could now express it, would be that you should effect your escape. Let us now think only of obeying him, and mourn him afterwards.'

Accustomed to submit in everything to Joanna's will, Lavocca was to all appearance herself again before they resumed their flight; she shed no more tears, but instead of using her former vigilance, kept her eyes fixed on the ground, as though she cared little now what fortune happened to her, and lagged somewhat behind the rest. It was a harsh blow of fate that had deprived her of the being who was so soon to have been her husband, but, as a matter of fact, she had been by no means passionately devoted to poor Santoro; the love, as in her mistress's case, had been almost wholly on one side, only in the reverse order as to sex; and, moreover, Lavocca was a coquette in her way, with no stronger feeling of any kind than that of exciting admiration. Joanna, indeed, was as much grieved as she, at their late companion's death, for she could not but be aware that she herself had been the involuntary cause of it. But on the other hand, now that the pursuit of those whom she had such good cause to fear was over, or seemed to be so, and while the reward, for which she had fought so hard, seemed within her grasp, her heart had scarce room for grief. The dawn had broadened into daylight, and from where they stood, upon a low spur of the mountain, some portion of their city of refuge was to be seen. 'See, Walter,' whispered she triumphantly, as they moved side by side together; 'yonder is Palermo; the troops are not far from hence; but in any case, in one hour more, you will be free, and I shall be bound only by the sweet ties of love and duty.'

The words had scarce escaped her lips, when a line of fire, accompanied by a splutter of musketry, broke out from a small thicket close to the right of them, and she dropped down at his feet like a stone. When the blinding bitter smoke had rolled away, Walter, kneeling by her prostrate form, found himself surrounded by a crowd of soldiers, astonished to see the young Englishman moved to tears by the just retribution that had overtaken one of his

captors. Lavocca, whom they took for a boy brigand, was bound hand and foot; and Mr Christopher Brown was drinking brandy as though it were water, from a flask which the officer in command was holding to his lips.

#### CHAPTER XLVII.—'HE IS WORTH ALL LOVE CAN GIVE HIM.'

Joanna was not dead; but she had received more than one wound, which the surgeon of the detachment pronounced to be very serious. As soon as they were bound up, and she could be moved, a litter was brought, in which she was conveyed slowly towards the town; and beside it walked Walter and Lavocca. A brief explanation of the matter had, of course, been given by the former, and the two women at once divided the interest of their captors with those whom they had been sent out to rescue. Poor Mr Brown, indeed, as he limped along, all dragged and torn, with anything but that smooth, starched look which distinguishes the rich citizens of London, was by no means an attractive object; but since his pecuniary value was well understood, he did not lack attention. Altogether, the procession was a sombre one, very unlike what the return of an expedition should be which has accomplished its object. For the soldiers were aware that they had not only 'encumbered with their assistance' the persons whom they had gone out to succour, but had inflicted a grievous wrong on her to whom the escape of the prisoners had been owing; while Mr Brown was too exhausted, and Walter too overcome with pity for his preserver, to shew any symptom of satisfaction. As she was lifted speechless into the litter, she had feebly held out her hand to him, and he had carried it to his lips, and retained it still. The soldiers thought that the young Englishman was but expressing his gratitude by so doing; but he would have done the same, had it been an open sign of their engagement. He was too full of commiseration and thankfulness to her, to abate one jot of an exhibition of affection which evidently gave her an intense pleasure; nor, whatever his unbidden thoughts might have been, did he permit himself to speculate upon what fortune might have in store for him should her wounds prove mortal. His whole existence was for the time devoted to her; the remembrance of his former life, including even his late experiences while in Corrali's power, were all swept away, to make room, as it were, for the absorbing reflection that this girl had given to him her love, and had proved its genuineness by sacrificing for him all she had—even perhaps to life itself.

At a small village on their way, a mule was found, whereon Mr Brown was lifted, which enabled him to converse as well as keep pace with his late companion.

'Walter Litton, you are henceforth my son, remember, whatever happens,' were his first words, spoken with great feeling. 'I mean,' added he, as the young painter stared at him, half-dazed with woe and wonder, 'whatever happens as respects dear Lillian.'

How strange it seemed that such a communication should give him pain; but yet it did so. He only bowed his head, by way of acknowledgment; then turned to Joanna in terror, lest she should have understood the old man's words.

Whether they referred to Lilian's state of health, or her feelings towards himself (of which he had never spoken openly to her father), he did not know, but it brought her home to his remembrance, and in so doing, seemed to do a wrong to his wounded charge.

'This young woman, to whom we owe so much,' continued Mr Brown, misunderstanding his glance, 'will of course be taken to our hotel, to be tended by my daughters like a sister.'

'Indeed, she deserves no less, sir,' answered Walter solemnly.

Nothing more was said until they drew near the city, when Mr Brown once more broke silence: 'I wonder whether that scoundrel Selwyn will venture to look me in the face?' The old merchant's mental vigour was evidently returning to him, now that he had reached the confines of civilisation; while Walter, who had been the leading spirit throughout their common dangers, felt, on the contrary, more perplexed and subdued with every footfall. Notwithstanding the earliness of the hour, a great crowd, upon whom Joanna's dark eyes rested without seeming to observe their presence, accompanied the procession to the hotel, where the good news had already penetrated, and on the steps of which stood the landlord, to do honour to their arrival.

'Is Sir Reginald Selwyn within?' was Mr Brown's impatient inquiry, delivered in very disinherited tones.

'No, sir; he left yesterday by the steamer to Messina. Her ladyship, your daughter, however, did not accompany him.'

In another minute, ere he reached the head of the stairs, the old man was clasped in Lotty's arms. To his astonishment, and still more to that of Walter, Lilian herself, pale and trembling, and looking like one risen from the grave, was standing at the doorway of the sitting-room. But ere she could shape the words of welcome, her eyes fell upon the litter, as it was slowly borne up-stairs, and concluding, doubtless, that it contained Walter, sick or wounded, her feeble strength forsook her, and she would have fallen senseless on the floor, but for her father's aid. He kissed her tenderly; and then, still hugging her to his breast, observed to Lotty: 'You will have two patients to nurse now, my girl, instead of one.—This is a woman—though you wouldn't think so,' continued he, pointing to Joanna—'and one to whom Walter and myself are indebted for our lives. And here is another young person in male attire. We have been in very queer company of late, as you will conclude; but these two are by far the best specimens of it, I do assure you.'

It was quite curious to see how quickly the old merchant had recovered from his late depression, and how naturally he reassumed the position of host and master, which he had occupied before his late misfortunes. Poor Lavocca, on the other hand, bereft of her lover, alarmed for the fate of her only friend, and overcome by the strangeness of the scene, so different from those of her mountain-life, looked piteous and disconsolate enough, and kissed the hand which Lotty held out to her with grateful humility.

'Now, Walter, my lad,' continued Mr Brown, 'you had better go home and make yourself comfortable, while I do the like, and then come up here to breakfast, and hear the doctor's report. I

have sent for the best in the place; and if money can save her, Miss Joanna shall not want for life, or anything that life can give her.'

Walter would have hesitated to obey this order, for he felt that his place was by the side of the wounded girl, whom he had promised to make his wife; but the arrival of the surgeon, who instantly ordered the patient to be conveyed into the inner room, and the apartment to be cleared, put the matter beyond his power, and compelled him to retire to his lodgings. Here he remained in a strange state of anxiety and suspense, scarcely knowing what to hope or what to fear; now moved with tender pity for Joanna, now filled with still more tender regrets upon Lilian's account; and very ill inclined to listen to the congratulations with which Baccari and his son overwhelmed him, but which gratitude compelled him to acknowledge. For it was indeed to the interest which Francisco had taken in him, and the promptness with which he had acted, upon seeing him depart with Santoro, that his rescue had been due. The lad had entertained some suspicion of his not being a free agent, during those last days he had spent in Palermo, and had watched his proceedings accordingly; had dogged him to the gate of the cemetery, and contrived to overhear the name of the locality where Corrali had pitched his camp. Then, when convinced of the young Englishman's departure and its object, he had hurried to the consul with the letter Walter had left behind him, and had also delivered that for Lilian into the hands of his mistress, her attendant. In consequence of these rapid measures, the troops had been sent out forthwith, with better information than usual as to the direction in which to march, and with orders to surround the mountain. The impatience and fury of Corrali himself had done the rest. But besides sending out the troops, the tidings thus disseminated by Francisco had roused public indignation, not only among the British residents, but with the natives themselves, against Sir Reginald; and it was amid a storm of hisses and execrations that he had embarked on board the steamer on the previous afternoon. He had not indeed been driven to do so by the general indignation; his natural courage would probably have been too high for that; but after having witnessed Walter's departure, he had felt inaction insupportable. To stay in Palermo and await the news of the massacre that he could have prevented by the mere signing of his name, was something that even his iron nerves refused to face; and therefore he had taken his place for Messina. He would willingly have carried Lotty with him, since, in her despair and wretchedness at the coming catastrophe, she was only too likely to drop some hint that would lead to his inculpation; but, on the other hand, to tear her away at such a time from her sick sister, was an act which would set every tongue wagging against him, and still more certainly arouse suspicion. So Sir Reginald had gone alone, to the great relief of all concerned, save the mob, who wished to duck him, and Mr Brown, who—no longer restrained by sentiments of respect for the baronet of the United Kingdom—yearned to give him a piece of his mind.

In the midst of these details came a message from the hotel, to say that Walter's presence was required there at once; he hurried thither, and found Lotty awaiting him in the sitting-room alone.

'I don't understand the matter at all, Mr Litton,' said she nervously. 'Everything has been so strange and terrible, that it may well have done away with my poor wits; but this poor brigand woman, it seems, is dying; and though Lillian is most unfit to be her companion under such circumstances, she has insisted upon being with her, and now you have been sent for to see them both—alone.'

Walter's heart was too full to speak; he only bowed, and followed Lotty through the door that led into the sick-room. She ushered him within it, and then immediately withdrew, taking Julia and Lavocca with her; and Walter found himself alone with the two women, to each of whom—but out of devotion to one of them—he had plighted his troth. Joanna, looking strangely unlike herself in feminine garb, and with features from which the near approach of death had chased every touch of harshness, and left all womanly, was lying on Lillian's couch; while Lillian—with cheeks as pale as those of her companion, and which she in vain strove to keep free from tears—was sitting in an arm-chair by her side. She signed to him in silence to draw near Joanna.

'I have sent for you, Signor Litton,' began the latter, in weak and broken tones; when a gentle hand was suddenly placed upon her arm, and a soft voice interrupted her with: 'Why not call him Walter?' 'Ah, you have a good heart,' murmured the dying girl. 'Yes, I will call him Walter, since it is for so short a time.—Walter, I have sent for you, to bid you farewell. The doctor tells me—though indeed I felt that it was so before he came—that I am dying. It is better that this should be, even on my own account, for what had I to live for save a love that could never be returned; and upon yours, how much better, since it will set you free.'

Walter's eyes were fixed upon her with an ineffable tenderness and pity, as he replied: 'Do you suppose, then, that I wish you to die, Joanna, you who have just preserved my life?'

'No; you are too generous, too unselfish, to wish that; but, nevertheless, my death will make you happy, and therefore death is welcome to me. It was but a mad dream of mine—but I am a poor ignorant foolish girl—that I could ever win your love. I see that now. Yet you won mine, all that I had to give, Walter, and you will keep it still; not like this other one's' (here she smiled on Lillian); 'yet something not altogether worthless to think of now and then, and draw a sigh from you. I hope that I shall not be quite forgotten, Walter?'

'You will never be forgotten, Joanna, while the life that you have given still abides within me.'

'And if I had lived, you would have kept your word?'

'I would have made you my wife, so help me, Heaven!'

'Brave heart, brave heart!' continued Joanna. 'He tells the truth to man and woman.—You knew this before, Lillian, but he did not know you knew.—Give me your hand, Walter. This hand is mine,' she murmured, carrying it to her parched lips, 'and I have the right to dispose of it.—Now, Lillian, give me yours.' Then she took Lillian's hand, and placed it in Walter's. 'You are worthy of him; you will make him happy, as I never could have done. May Heaven bless you both!'

The physical exertion she had used had been very slight, yet she seemed greatly exhausted.

'Indeed, Joanna, you must say no more,' whispered Lillian, caressing her. 'Walter must go away for the present; you are doing yourself harm.'

'As you please,' murmured Joanna with a sad smile, 'though I do not think I can take harm. But before he goes—he is yours now, Lillian; I have made him over to you—may I ask of him to kiss me?'

Walter bent low, half-blind with tears, and gave Joanna his first kiss: it was his last one also; for she died within an hour or so, quite suddenly, in Lotty's arms, whom she took for Lillian, whose scanty strength had succumbed to the late excitement.

'Be good to him, dear,' were the poor girl's last words. 'He is worth all love can give him.'

### NARCOTICS.

THE indulgence in narcotics—something to dull, stupefy, and soothe the nervous system—is a predominant human weakness. Nature has been ransacked for narcotics. Tobacco, opium, betel-nut, Indian hemp, even some kinds of fungi, are employed for the desired object. When tobacco was first introduced into Europe, its use was nearly everywhere looked upon with dislike by the authorities. The efforts that were made to suppress it amounted to nothing less than persecution, and their want of success furnishes a curious illustration of the uselessness of legislative interference with the individual's legitimate freedom of action. It serves also to illustrate in some measure the strong hold which the taste for narcotics obtains over the mind, especially as tobacco is one of the mildest narcotics in use. Amongst ourselves, not to mention King James's well-known *Counterblast*, many petty restrictions were laid on the sale of tobacco during that monarch's reign, and the import duty was raised from twopence to six shillings and tenpence a pound. In England and elsewhere, remonstrance and penalties were equally unavailing. Tobacco made its way steadily into favour, and is believed to be now in use among not less than eight hundred millions of the human race.

Measures of a severe nature have been tried in China to check the use of opium, and have been quite as unsuccessful. However apathetic the Chinese may be in respect to most things, they will not submit to the withdrawal of their favourite narcotic. But in case of so dangerous a poison, some restrictions are as much needed as they are on the sale of spirituous liquors amongst ourselves; for the effects of habitual excess are not less deplorable than those of habitual drunkenness. Of forty prisoners confined in the House of Correction at Singapore, thirty-five were found to use opium; and of these, seventeen, who had been in receipt of eighteen shillings a month as wages, spent twenty-four shillings on opium, the difference being obtained by theft. From a sanitary point of view, the results are equally sad. The confirmed opium-eater in the East seldom lives beyond the age of forty, and may be recognised at a glance by his trembling steps and curved spine, his sunken glassy eyes and sallow withered features. The muscles, too, of his neck and fingers often become contracted. Yet incurring even this penalty

will enable him to indulge his vice only for a certain length of time. Unlike the healthy enjoyment which we derive from our appetite of hunger, and which Nature herself renews periodically, the enjoyment of the opium-eater gradually diminishes as his system becomes habituated to the drug. From time to time he must increase the quantity which he takes, but at length no increase will produce any effect. Under these circumstances he has recourse to a dangerous expedient: he mixes a small quantity of corrosive sublimate with the opium, the influence of which is thus for a time renewed. Then these means also fail; when the victim must bear the miserable condition to which he is reduced, until probably, sooner or later, he sinks into the grave. On the excitable temperament of the Malays and Javanese, a strong dose of opium causes a state of frantic fury amounting almost to madness, and this often ends in that homicidal mania which has been called 'running amuck'; in other words, in the individual attacking with his crease or dagger every one whom he meets, so that it becomes necessary to shoot him down with as little compunction as we do a mad dog. In Java, opium is not allowed to be sold except in an adulterated form, the risk of these evil consequences being thus in some measure lessened.

So far as the effects of opium on the system are concerned, it is almost entirely a matter of indifference in what way the drug is used. Whether it be taken in the solid form of pills, in the liquid form of laudanum, or inhaled from a pipe as heated vapour, it speedily exerts its pernicious and almost irresistible influence over the mind; so that few possess the iron will needed to relinquish the habit when it has once been fairly acquired. How completely even the most intellectual and cultivated minds may become enslaved was well illustrated in the cases of Coleridge and De Quincey, whose highly coloured descriptions of their experiences are said to have been productive of much evil amongst the educated classes of this country. These descriptions must not, however, be regarded as safe criteria of the usual influence of opium on the colder temperament of the North European. According to Dr Christison, it seldom produces a more striking effect on the Anglo-Saxon constitution than the removal of torpor and sluggishness, thus rendering the opium-eater a pleasant and conversable companion; but these small advantages, in turn, are purchased by a period of subsequent pain and depression, the misery of which it would be difficult to exaggerate.

Opium, besides acting as a narcotic, possesses a remarkable power as a restorative. By apparently checking the natural waste of nervous energy, it enables the system to support fatigue, beneath which it must otherwise inevitably have sunk. For this reason it is much used by the Halcarras, the palanquin bearers and messengers of India, who journey almost incredible distances, furnished with nothing more than a bag of rice, a little opium, and a pot to draw water from the wells. The Tartar couriers also use it to sustain them, when compelled to travel night and day in crossing the arid deserts of Central Asia; and in some parts of the East it is administered as a restorative even to horses.

It is difficult to come to any definite conclusion as to whether the physical character of eastern

races who habitually use opium as a narcotic has deteriorated in consequence. No doubt the general belief is that even moderate indulgence must necessarily be injurious, and it is easy to point to the enervated character of the Turks and other oriental races as a probable result of the habit. But at the same time it is a disputed point among physiologists how far this belief correctly represents the truth. The opinions of many men well acquainted with the East might be quoted in opposition to it; for example, Dr Eatwell, formerly of the East India Company's service, in writing to the *Pharmaceutical Journal*, has affirmed that, as regards the great mass of the Chinese, no injurious effects of the opium they consume can be noticed, the people being generally a muscular and well-formed race. Dr Macpherson has given similar testimony in respect to the Chinese, and Dr Burnes in respect to the natives of Scinde and Cutch; whilst, on the other hand, Dr Little of Singapore is of opinion that the native population of that island would be in danger of becoming extinct from the use of opiates, were it not constantly recruited by immigration. It is, however, evident that the question can only be satisfactorily answered by knowing the real extent to which opium-eating prevails among the different eastern populations, and of this no reliable statistics can be obtained.

There is a similar want of definite information in respect to the United Kingdom. Attention was partially drawn to the subject so long ago as 1844, by an inquiry that was made into the state of large towns in Lancashire; and since that time there is every reason to believe that the evil has largely augmented. The increase in the quantities of the raw material imported would alone be sufficient to render this probable; for whilst, in 1852, the importation amounted to 114,000 pounds, it had grown to 356,000 pounds in 1872. No doubt a large portion of this enormous quantity is employed in the manufacture of morphia or other alkaloids, and is either exported or employed for legitimate medicinal purposes; but it is difficult to account for an increase in twenty years of two hundred per cent., except on the supposition that the drug is more largely used as a narcotic than is generally believed. The facility with which this form of vice can be concealed, renders direct evidence on the subject difficult to obtain; but such evidence as can be procured tends to prove that the above supposition is correct. We have recently been informed by the medical attendant to the workhouse in one of our larger cities, that a week rarely passes without a case of opium-eating coming to his knowledge among those who seek admission to the workhouse; and that he has known women, when suffering from the depression consequent upon their enforced abstinence, even go down on their knees to beg that he would administer to them an opiate. Again, there is reason to believe that opium is a favourite stimulant with many underfed and overworked artisans and labourers; and from inquiries made by parochial officials, clergymen, and others, this would appear to be especially the case in agricultural districts. In the fenny districts of Lincolnshire, a belief being prevalent that opium acts as a preservative against the effects of a damp climate, many of the inhabitants have in this way become addicted to its use.

Another and even more reprehensible form of the opium evil among the lower classes is to be found in the practice of administering soothing mixtures to young children for the purpose of keeping them quiet. In one instance, a mother, because her child was unwell, has been known to place a piece of crude opium in its mouth to suck, the death of the child being naturally the consequence; and though cases of such gross and culpable ignorance as this are no doubt rare, it is certain that the administration of soothing sirups and cordials is too commonly resorted to. In large manufacturing towns, where mothers are often employed in factories during the day, their infants are frequently placed for the time in the care of nurses; and these women seldom feel any compunction in administering an opiate to a child who is troublesome. It cannot be too widely known how greatly such a practice tends not only to the direct increase of infant mortality, but also to the permanent injury of the constitution, by inducing convulsions and other similar nervous diseases.

Opium in one of its forms enters largely into the composition of many of the pain-killers and patent medicines so freely advertised for domestic use in the present day, and for this reason the greatest care is needed in having recourse to any of them. Taken, perhaps, in the first instance, to alleviate the torments of neuralgia or toothache, what proves to be a remedy soon becomes a source of gratification, which the wretchedness that follows on abstinence renders increasingly difficult to lay aside. The same must be said of narcotics, such as bromide of potassium and hydrate of chloral, frequently resorted to as a remedy for sleeplessness; the system quickly becomes habituated to their use, and they can then be relinquished only at the cost of much suffering. Indeed, the last-mentioned of these two drugs obtains over the mind a power which may be compared to that of opium, and is, moreover, liable to occasion the disease known as chloralism, by which the system ultimately becomes a complete wreck.

Looking at the whole question of the medicinal use of narcotics, it is perhaps not too much to say, that they should never be employed except with the authority of a competent medical adviser.

Turning again to the narcotics of savage or but semi-civilised races, we find a species of fungus (*Amanita muscaria*) employed by the natives of Kamtschatka and the adjoining provinces of Siberia. It grows plentifully in parts of Kamtschatka, and is there generally prepared for use in several ways. The inhabitants either gather it during the hottest months, and hang it in strings to dry in the open air, or leave it to ripen and dry in the ground, when it possesses stronger narcotic qualities. Small-sized specimens, covered with warty excrescences and deeply coloured, are also considered more valuable than the smooth pale ones. Sometimes it is eaten in soups and sauces, or is taken mixed with the juice of the whortleberry; but the more usual method is to swallow it whole, rolled into the form of a pill, and a single large-sized toadstool thus taken is sufficient to cause the narcotic effects during a whole day. These bear a very close resemblance to those of ordinary intoxication, and, like them, often end in complete insensibility. Whatever may be the natural temperament of the individual shews itself with unusual distinctness. A man who is fond of music

or of talking will be constantly singing or chattering; and secrets often thus slip out, the disclosure of which is the source of much subsequent trouble. In this form of narcotism, too, the power of estimating the size of objects is temporarily destroyed, so that a man wishing to step across a straw or a small twig will raise his foot as though about to step across the trunk of a tree.

The Siberian fungus is not the only narcotic in which this last peculiarity is found. Similar erroneous impressions are caused by the Indian hemp, which, though it is used in south-western Asia, and indeed, in the Brazils as well, is more properly the narcotic of the African continent, where it is known to the native races from the Mediterranean to the Cape of Good Hope. It is the same plant that is grown in Europe for the sake of its valuable fibre; for, though probably indigenous to India, it is able, like the potato and the tobacco plant, to adapt itself to a great variety of climates, and is grown even in the north of Russia. Its narcotic virtues depend on a resinous substance contained in the sap; and this is much more abundant in tropical climates than it is in temperate. Indeed, the European plant is almost devoid of it, though it possesses a strong odour which has been known to make people ill who have remained long in a hemp-field. Thus, when the dried plant is either smoked or eaten, its effects are both rapid and powerful. In Morocco, where the dried flowers are generally smoked, a single pipe not larger than an ordinary tobacco-pipe is sufficient to intoxicate. Among the Arabs and Syrians, the usual method is to boil the leaves and flowers in water mixed with butter to the consistence of a syrup, which is called *haschisch*, and as it has an extremely disagreeable taste, is eaten in a confection of cloves, nutmegs, and other spices. But however the narcotic may be used, the pleasure it affords is much the same in character. It has been described as consisting in 'an intense feeling of happiness, which attends all the operations of the mind. The sun shines on every thought that passes through the brain, and every movement of the body is the source of enjoyment.' But the most remarkable peculiarity of the Indian hemp has yet to be mentioned: a dose of the resin has been known to occasion that strange condition of the nervous system called catalepsy, in which, notwithstanding the force of gravity, the limbs of the unconscious patient remain stationary in whatever position they may be placed.

The use of the coca-tree as a narcotic in Peru and Bolivia is of very great antiquity. When the Spaniards landed under Pizarro, they found the natives chewing the dried leaves, in exactly the same way in which they have continued to chew them down to the present day. Efforts were indeed made, soon after the subjugation of the country, to put a stop to the practice, for the plant had acted an important part in the Peruvian religious ceremonies, and its use was looked upon by the conquerors as an obstacle to the spread of Christianity. Nevertheless, the Indians persevered in spite of every prohibition and severity. Before long, too, the owners of mines and plantations discovered that it was to their interest to connive at the habit, as, with its aid, their labourers were able to perform more work on a given quantity of food than they could do without it. It has thus gradually

become the universal custom to allow from fifteen to thirty minutes, three or four times a day, for the purpose of chewing. At these times the first object of the Indian is to make himself as comfortable as possible, for the coca fails to produce its effect unless the chewer be perfectly quiescent. He stretches himself at full length in the shade, on a couch of dry leaves or soft turf, and rolling a few of the coca-leaves into a ball, conveys them into his mouth; adding immediately, to bring out the full flavour, a small quantity of unslaked lime, or of the alkaline ashes of certain plants. When thus engaged, the apathy he displays to everything around him is something marvellous. No entreaty on the part of his employer will induce him to move, and if he be a confirmed *coquero*, he is indifferent even to drenching rain or the roar of wild animals in the neighbouring thicket. In what way the pleasures of the coca-leaf manifest themselves is not known, but they must evidently be of a very seducing kind, thus to render men insensible to personal danger.

Notwithstanding the wide prevalence of the use of narcotics, little or nothing is known of the way in which their different effects are produced on the system; and the problem is complicated by the number of active substances that enter into their composition. Opium, besides other more ordinary ingredients, contains no fewer than eleven peculiar organic compounds, all of which are believed to share in producing its usual effects. It has, however, been noticed that many symptoms of narcotism bear a close resemblance to those of insanity. The wild laughter of a man under the influence of the deadly nightshade cannot be distinguished from that of a maniac, and the false impressions as to the size of objects, caused by the Indian hemp and the Siberian fungus, are a permanent feature in the malady of many lunatics. It has been suggested by Dr Carpenter that much light might be thrown on the connection between the mind and the body by studying the phenomena of drunkenness, and it seems probable that those of narcotism in different parts of the world might be made to yield equally rich results. Of one thing we may be quite certain. The use of tobacco has become a positive vice. The wastefulness of money which it causes, without a compensatory advantage, is alone deplorable.

### PENNY ICES.

IN going through the busy streets of London, one cannot help noticing a new trade that has been struck out—the sale of penny ices, conducted by means of wheeled barrows on the side of the thoroughfare. Likely enough, the vendor is surrounded by spendthrift little boys, who lap in the frozen ‘cream’ as blissfully indifferent to its composition as they are unconcerned about the process by which the phenomenon of freezing is brought about under a boiling sun. This happy indifference is not exactly confined to young gentlemen who take their refreshment at barrows in the streets, and perhaps it is as well that it should not be. As a general rule, it is perhaps better not to inquire too closely into the production of what we eat and drink. But the freezing of cream at a time of year when dogs are popularly supposed to go mad from heat, and

people are every day falling down from sunstroke, is a phenomenon of so striking a character, that, but for our familiarity with it, it would probably arrest the attention of most of us.

It is one which certainly ought to arrest attention, for it is one which illustrates in a very interesting way not only the operation of natural forces which are continually working mighty and innumerable changes on the face of the earth, but—what will probably strike most minds as something even more curious and interesting still—it shews how the Creator has, as it were, interposed to check the too violent operation of His own laws, and to arrest the rapidity of changes which, without some such check, would speedily reduce this beautiful earth of ours to a condition of chaotic ruin and utter desolation.

Nothing can be simpler than the actual process of freezing adopted by our locomotive manufacturers of penny ices, and indeed by confectioners generally. It consists merely in putting into a metal cylinder whatever is to be frozen—new milk, fresh eggs, loaf-sugar, and fresh butter, are the ingredients which the Confectioners’ Journal gives for ice-cream—surrounding it with equal quantities of broken ice and salt, and rapidly spinning it round, so as to produce a little friction.

Now, everybody knows, or may know by trying it, that ice alone would not freeze the contents of the cylinder. It would simply melt slowly away, of course making whatever was near it very cold, but not cold enough to freeze. Indeed, it would seem ridiculous to suppose that the temperature which would melt the ice could possibly freeze the cream that was in the middle of it, especially when we raised that temperature by causing friction. Common-sense might suggest that while the cream got colder, the ice and the water around it would get slightly warmer, and that the result would be the immediate temperature of the two.

The supposition, however, would not be nearly so ridiculous as it would appear, and common-sense would be quite wrong as to the facts of the temperature.

The cream certainly will not freeze with ice alone around it, but it will come a great deal nearer to freezing-point than might be expected; for, although it will keep on giving out its heat to the surrounding ice, it will not make the ice in the slightest degree warmer, even though the process be aided by friction. So long as a particle of ice remains unmelted, the ice itself and the water it is in will stand at one fixed temperature, however much heat may be imparted to it; and unless the cream is in contact with something that ever communicates warmth to it, it will continue to get colder and colder so long as an atom of ice remains near it.

The explanation of this is to be found in a law which, like that of gravitation and many other natural laws, we can see in operation, without in the least degree comprehending it. The law is this: that where a solid body like ice becomes a fluid body like water, a certain amount of heat is always absorbed and concealed by the fluid. In the same way, when a liquid like water becomes a vapour like steam, a certain amount of heat is absorbed and concealed by the steam. The cream in the cylinder gives out its heat to the ice; but instead of the heat making it warmer, it helps to melt the ice, and then totally disappears in the

water. It does not make the water warmer any more than it did the ice; it is hidden or *latent* heat. It cannot be detected in any way either by the sense or by the thermometer; but it is quite certain that it is there, and if we convert the water back again into ice, it will immediately make its appearance, and will affect the thermometer.

A solid is never converted into a liquid, or a liquid into a vapour, without the consumption of more heat than would be required to effect the change, if it were not for this mysterious provision of nature; and if we can contrive to produce the rarer body from the denser—the liquid from the solid, or the vapour from the liquid—very rapidly and abundantly, as we do when we mix ice and salt together, and set a metal cylinder rapidly revolving in the midst of it, everything near it, including the cylinder and its contents, will be speedily robbed of its warmth, and reduced to a temperature below freezing-point.

Thus it is, then, that we are able to produce frozen cream in the London streets during 'dog-days.' We take advantage of two natural laws, with one of which everybody is familiar enough. Everybody knows that when water is reduced in temperature to 32° Fahrenheit it becomes ice, and that when ice is exposed to a temperature above 32° it is converted into water. Everybody knows that from the surface of the ocean water rises into the air in the form of vapour; that when the vapour comes in contact with something colder than itself, such as a stratum of cold air or the top of a mountain, it condenses into clouds, and if still further chilled it falls in the form of rain, or as snow, sleet, or hail, to be again melted and evaporated. But, by itself, the law which effects these changes would bring about the most disastrous consequences. It would produce them all by a series of violent shocks, which would often be more terrible and destructive than earthquakes. Seventeen volumes of water will expand into about eighteen volumes of ice; and even with the slow and gradual process of freezing—which nature has arranged for us, we see that water-pipes are burst, vessels of all kinds, from bottles to reservoirs, are riven and cracked, and even rocks and mountains are rent and torn by the irresistible force of the expansion. But suppose all this took place instantaneously; that the first cold gust of wind that swept across a body of water after it had cooled to 32° froze it at once into a solid mass; or that the water filling a crevasse in a mountain-peak were thus suddenly congealed and expanded; or that the tremendous volumes of water that are often rolling over our heads in the form of clouds were liable at any moment to congeal into ice, and come crashing down by the ton! And a thaw would often be even more ruinous than a frost. An accumulation of snow and ice on a mountain-peak or a rising ground, or even a house-top, would be simply a reservoir liable to burst at any moment, and come down in overwhelming and devastating torrents. All these and a thousand other disasters are prevented by the wise and beneficent interposition of the other law which we see at work on the ice-vendor's barrow.

Nature ordains that in every fluid a certain amount of heat shall be hidden away as a reserve force, to be brought out wherever there is a danger of too sudden a change. Nobody could tell that

the heat was there; but the moment the surrounding cold becomes so great that the fluid is in danger of being suddenly congealed into a solid, the latent heat at once betrays itself, mitigates the cold, and renders the process a slow and gradual one. On the other hand, the solid which the ice-vendor puts around his tins no sooner begins to dissolve, than the fluid it produces begins to absorb heat with such rapidity that everything around it is robbed of its warmth, and liquefaction is arrested. The change, which but for this would have been almost instantaneous, is effected slowly and by degrees; and if, notwithstanding this loss of heat, we still keep up a rapid thaw by adding salt to the ice, and by revolving the vessel, the cream within it, and everything else around, must be laid under contribution, and must part with its warmth, even though it be frozen hard, and that in a sultry thoroughfare on a broiling August afternoon.

#### HE GIVETH HIS BELOVED SLEEP.

BY ANTONIA DICKSON.

A LITTLE child rests on a bed of pain,  
With an aching head and a throbbing brain;  
A feverish flush on the soft cheek lies,  
And a wistful look in the sweet blue eyes,  
As the sick child moans: 'How the slow hours creep!  
Will the Lord not send to His little one sleep?'

And the mother smoothed from the child's brow fair  
The clustering locks of her golden hair,  
And murmured: 'My darling, we cannot tell;  
But we know that the Father doth all things well;  
And we know that never a creature in pain  
Addressed a prayer to His mercy in vain.  
Time has no line that His hand may not smooth;  
Life has no grief that His love cannot soothe;  
And the fevered brow shall have rest at last,  
In the healing shade from the Death Cross cast.  
Look up, my precious one; why shouldst thou weep?  
The Lord giveth aye to His loved ones sleep.'

And the little one gazed with a glad surprise  
In the loving depths of those patient eyes,  
Then lifted her lips for one long embrace,  
And turned with a smile on her weary face.

And the mother smiled as the early morn  
Marked the deep peace on the childish form,  
And cried aloud in her thankfulness deep:  
'The dear Lord be praised, Who hath given her sleep!'

Ay, mother—she sleeps, in that charmed repose,  
That shall waken no more to earth's pains and woes,  
For the Saviour hath gathered His lamb to His breast,  
Where never life's storms shall her peace molest.  
His dear love willed not that Time should trace  
One sorrowful line on that innocent face;  
Others, less favoured, might suffer their share  
Of the midnight toil and the noontide glare;  
Others might labour, others might weep,  
But 'the Lord giveth aye to His loved ones sleep.'

## SOME EARLY RECOLLECTIONS.

### SECOND PAPER.

IN looking back to these long-past times in the little country town by the Tweed, I have hardly done justice to that respectable body, the local militia, or 'locals,' as they were familiarly called, who came into existence two or three years before the regular militia made their appearance in the place. I think the date of the locals was about 1808. The period of the year chosen for their drill was in June, when the days were long, the weather was fine, and there was no particular pressure in rural occupation. The turnips had been all sown, and little would be in hand till harvest. Now was the time for that pleasant outing which could not but be acceptable to farm-labourers—a holiday for a fortnight in the county town, in circumstances varied and agreeable. Changing their rustic attire, they were for fourteen days to exhibit themselves in the attractive guise of soldiers—a red coat, white breeches, and black leggings, with a row of leaden buttons to the knee. It was a good turn-out, superior to the slovenly trouserings, which did not come into fashion till the conclusion of the war. To get into the locals was a kind of privilege, not only on account of the exemption from ballot, but for the pleasure of an annual holiday. During the fortnight, the members of the corps were billeted at free quarters, were provided with rations, and had absolutely no work to do but to pipeclay their breeches and belts, and scour the barrel of their gun. The parading, marching, and firing were mere amusement.

The higher class of officers were county gentlemen or their sons; the subalterns were well-to-do tradesmen. The sergeants were mostly men who had been in the army, and were preferred from their knowledge of regimental business. To one old sergeant of particular mark was assigned a double duty. He took charge of all the dresses and accoutrements in an adjoining feudal keep, and on annually taking the field, was, as a good disci-

plinarian, intrusted with the command of the 'awkward squad.' The squad usually consisted of about a dozen individuals, who, though unchallengeable in bodily aspect, laboured under the misfortune of not readily knowing their right foot from their left. When put in the ranks, there was no getting them to keep the step, and they were otherwise so odd in their movements, that they were remitted for cultivation to the old sergeant, who, in a secluded part of the town green, had a desperate job in bringing them into anything like decent military order. From the perplexities in which they were, as to managing their legs, standing upright, and looking straight forward, the awkward squad were objects of daily amusement to the school children.

In their drill, when in line, the locals were often commanded to 'fire a volley and charge bayonets after it,' and in this, with little practice, they acquitted themselves wonderfully; there being no enemy in front to charge against. Firing at targets with ball-cartridge was less successfully executed. But we have to bear in mind that the gun was the old 'brown Bess,' with which instrument, it has been said, not more than one in sixty bullets ever took effect. On one occasion, at this ball-practice, there occurred a misadventure. Willie Paterson, a weaver, noted for his buckish appearance on Sundays with a pair of boots, which, according to fancy, sometimes figured with tops, and at other times with tassels, became a member of the locals, no doubt with a view to escape being balloted for the militia. He was not quite aware of the dangers attending ball-practice. In grounding his musket after loading, Willie accidentally touched the lock with his foot. The weapon went off, and shot him in the shoulder. Willie dropped, and was carried home. The case roused general sympathy. He was viewed as a martyr to duty. Presents poured in upon him, and he was like to be killed with kindness. Instead of being a misfortune, the wound, which was by no means severe, proved to be the luckiest thing that could have happened. From the gifts of money he received, he was able to build a house, and set up as a small shopkeeper. In this

last respect, he was not particularly qualified by scholarship. I can recollect that some fun was caused in the town by his having, in writing to a merchant, requested him to send a gross of *organs*, instead of a gross of *oranges*. Willie Paterson has long since passed away, but I see that his neat two-story house remains as a memorial of the fortunate misadventure in the locals.

Among my early recollections are those connected with French prisoners of war. To the little town a few had been sent to live on parole in 1803, and there they continued in the light of familiar inhabitants for a period of eight or nine years. Though called French, only two or three deserved that appellation. The most of them were Dutch, Walloons, or Danes—unfortunate men who had been captured in connection with the French service, and sent to spend their lives on a small weekly allowance in an inland Scottish town. The two or three Frenchmen walked about in a quiet genteel way, doing nothing in the shape of work. One of them was a slim gentlemanly looking man of middle age, with gray silk stockings to the knee, and a small queue dangling over the neck of his coat. His name was Monsieur Boutelle. He lived in the close adjoining my father's house, and there my brother Robert and I, taking an interest in him, and occasionally doing him a trifling service, such as presenting him with a dish of small trouts, had the honour of making his acquaintance, and familiarising ourselves with the French language. The Dutchmen sent as prisoners on parole naturally took to the river and its tributaries, in which they employed themselves fishing for trout or eels, the boys in the town helping them to dig for worms as bait, and pointing out the spots where they were likely to be successful in their pursuit. They seemed to have no difficulty in learning English, and became at length quite companionable with the natives. The Walloons and Danes were a different set. They occupied themselves as weavers, and as such were almost merged in the general class of artisans. Two or three years later came a *détenu* of a different class. He was seemingly the captain of a ship from the French West Indies, who, by some special grace, had been permitted to bring with him his wife and a negro servant-boy named Jack. Black Jack, as we called him, was sent to the school, where he played with the other boys on the town green, and at length read and spoke like a native. He was a good-natured creature, and became a general favourite. Jack was the first pure negro whom the boys at that time had ever seen.

None of these classes of prisoners broke his parole, nor ever gave any trouble to the authorities. They had not, indeed, any appearance of being prisoners, for they were practically free to live and ramble about, within reasonable bounds, where they liked. In 1810, there was a large accession to this original body of prisoners on parole, to whom, however, on account of some special circumstance, I shall afterwards refer. Meanwhile, therefore, I pass on to a remarkable episode in connection with prisoners of war who were not on parole, but kept under restriction.

In the heat of the war in Spain, depots for the reception of crowds of the common class of prisoners were established in various parts of the country. The nearest of these, and which I on one occasion visited with my father, was at Penicuik, about ten miles from Edinburgh. Here, on a level space in the depth of a valley, was a group of barracks, surrounded by tall palisades, for the accommodation of some hundreds of prisoners, who, night and day, were strictly watched by armed sentries, ready to fire on them in the event of outbreak.

The day on which we happened to make our visit was a Sunday, and the scene presented was accordingly the more startling. Standing in the churchyard on the brink of the hollow, all the immediate surroundings betokened the solemnity of a Scottish Sabbath. The shops in the village were shut. From the church was heard the voice of the preacher. Looking down from the height on the hive of living beings, there was not among them a vestige of the ordinary calm of Sunday—only *Dimanche*! Dressed in coarse woollen clothing of a yellow colour, and most of them wearing red or blue cloth caps, or party-coloured cowls, the prisoners were engaged in a variety of amusements and occupations. Prominently, and forming the centre of attraction, were a considerable number ranked up in two rows, joyously dancing to the sound of a fiddle, which was briskly played by a man who stood on the top of a barrel. Others were superintending cookery in big pots over open fires, which they fanned by the flapping of cocked-hats. Others were fencing with sticks amidst a circle of eager onlookers. A few were seated meditatively on benches, perhaps thinking of far-distant homes, or the fortune of war, which had brought them into this painful predicament. In twos or threes, some were walking apart to and fro, and I conjectured they were of a slightly superior class. Near one corner was a booth—a rickety concern of boards—seemingly a kind of restaurant, with the pretentious inscription, '*Café de Paris*,' over the door, and a small tricolor flag was fluttering from a slender pole on the roof. To complete the picture, fancy several of the prisoners, no doubt the more ingenious among them, stationed at small wickets opening with hinges in the tall palisades, offering for sale articles, such as snuff-boxes of bone, that they had been allowed to manufacture, and the money got by which sales procured them a few luxuries.

Altogether, the spectacle to me, as a boy, was very extraordinary, and has left an indelible impression on my memory. What has since struck me as the drollest thing about the scene, was, that the multitudinous diversions and occupations should have been going on at full blast in the hollow of a pretty Scottish dell on a Sunday forenoon, almost within the sound of psalm-singing in the parish kirk. I venture to say, at least, that the congregation in the church, if they had cared to listen, could not have failed to hear the merry strains of the vivacious French fiddler. In the present orderly times, when everything is inquired into and debated, we cannot imagine that the eccentricities of the prisoners would have escaped public censure. The very circumstances specified serve to illustrate the exceptional condition of affairs during the war. Society was too much taken up with the question of national safety to

seriously concern itself about the conduct of these Frenchmen; while the government was probably fain to let them amuse themselves any way they liked, so long as they were amenable to discipline, and did not attempt to make their escape. Possibly the prisoners were not without visits from religious instructors, but I did not see or hear of any evidence to that effect.

Though far from being ill-treated, yet, hemmed in pretty much like wild beasts in a menagerie, and with literally nothing to do in the way of useful employment, the prisoners at Penicuik could not but fret, and, in despair, try to get out. They were under no parole, and perhaps felt that they were entitled to procure their liberty if they could do so by any species of artifice. Occasionally, two or three made the attempt, at the risk of almost certain death; for the sentries were vigilant, and authorised to fire upon any one trying to make his escape. What were the efforts which these unfortunate *détenus* made to burst out on a large scale, may be judged from the following incident.

One afternoon, on coming out of school, and emerging on the main street, my companions and I were startled with the spectacle of a party of French prisoners of war under a military escort. Even to boys, who are not very sensitive, it was an appalling scene; something at least which I can never forget. The poor wretches in their miserable attire, mostly without shoes, and faint from hunger, walked slowly and painfully within the circle of soldiers towards the county jail, the only place of security in the town. There they were immured for the night, and succoured with some provisions, which they thankfully received. Soon it became known that they had escaped from Penicuik, and in a way interesting to record. From one of the barrack-like buildings in which they were confined at night, they contrived to excavate a tunnel beneath the courtyard, the palisades, and the outer promenade for sentries, as far as the woody bank beyond. There were some serious difficulties in the undertaking. The excavators had to work with imperfect tools, such as bits of the iron hoop of a barrel. A greater difficulty consisted in getting rid of the excavated earth without exciting suspicion. This caused a great deal of trouble, but somehow the pocketful of loose stuff that were brought to the surface were happily got rid of. There was another very serious difficulty. Digging the tunnel in the required direction, and just as wide as would allow a man to creep through, it was almost impossible to determine on the point where the exit could be safely effected. By burrowing too far, they would get under the steep bank, and be unable to emerge to the surface. If they emerged too soon, even by a few feet, they would be exposed to the fire of the sentry. The whole enterprise was critical. It was a matter of death or life, and only certain daring spirits, ardently sighing for liberty, would engage in the terrible risk. One may imagine the months of agonising labour, digging night after night in that hideous tunnel, the dimensions of a common drain—the constant apprehensions of discovery—the trouble in carrying away and concealing the excavated material—the fears, the hopes attending the final issue.

So skilfully were matters managed, that none of the guards or prison officials was aware of the bold

attempt at escape that was to be made. The tunnel was completed; everything was ready for bursting forth. So far there had been an extraordinary success: the worst was to come. All things considered, the idea of getting clear off was little better than madness. The party were twenty-three in number. All were dressed in the yellow prison garb, which would everywhere reveal their character. They were unacquainted with the country. No more than two or three of them could speak English. The project was absurd, pitiable. The only rational conjecture I have been able to form regarding the apparent hopelessness of the attempt was, that the party designed, if possible, to reach a humble cottage, known as the Clay House, at Acrefield, in the immediate neighbourhood of the small town in which I lived, and where by some private understanding prisoners of war were received, and aided in escaping from the country. But even to get to the Clay House, without being seen, would be no easy matter. It was ten to twelve miles distant in a southerly direction, and was obscurely situated away from the main thoroughfare.

Whatever might be the scheme of operations, the party selected a moonlight night for the enterprise. With the prime engineer and leader in advance, the party, in single file, crouching down, and following close at one another's heels, stealthily crept through the tunnel to its extreme end, where it was thought to be safe to burst into the open air. The calculation as to the proper spot for issuing just within the loose scattered wood on the bank had been pretty correct. The leader, having cautiously loosened the earth until he saw the glimmer of the moonlight, pushed the incumbent mass upwards with his back, and in an instant was on his feet on the open ground, and hastening away among the trees up the acclivity. The others, one by one, followed, but not with equal success. The nearest sentry, seeing the torrent of fugitives, levelled his musket and fired, killing one dead on the spot. The alarm being thus given, other sentries fired. Following in pursuit, five were captured, and taken back to prison. The fugitives were now reduced to seventeen.

We may conceive that the hurried scrambling flight of the poor wretches, with dropping shots of soldiery in their rear, formed an exciting scene. It appears that one of the party, named Deschamps, had at times, under escort of a soldier, been permitted to visit shops in the village on errands connected with the prison, and had thus, by looking about him, and talking to the natives, learned the nature of the country around. His knowledge so acquired was now brought into use. After pausing for a few minutes to gain breath in the woods to the west of the village, he represented the propriety of pushing on in a southerly direction across a wild moory plain, full of peat-mosses, where some refuge could be obtained; and thereafter by crossing a hill get into a valley, in which was a small river tributary to the Tweed. His guidance was implicitly followed. Before dawn the party had ensconced themselves in the deep cuttings of the moss, where, in momentary apprehension, and peering across the heather, they were on the watch for pursuers. The only food they had was a little bread, which they carried in their pockets, supplemented by morsels of a raw turnip, which one of them had picked from a field

in the course of his flight. So passed over the first day, without any cause for alarm.

After dusk, they stole from their hiding-places in the moss, and, under guidance of Deschamps, crossed the hill above Leadburn on the south, and got into the vale of Eddleston Water. Holding down the valley, they reached the picturesque and secluded recess of Cowie's Linn. It was an admirable hiding-place, but its very seclusion rendered it untenable. They had nothing to eat but turnips, on which alone they subsisted the second day. To make matters worse, Deschamps, as scout to the party, had slipped down a rocky bank, and lacerated one of his legs so badly that he was scarcely able to walk. In the extremity to which they were put, it was evident that unless they reached the neighbourhood of a town, they must perish of starvation. At night, they resolved to advance, even at some risk of detection. Still pursuing their way down the valley, Deschamps limping dreadfully and half dragged on between two companions, the party at about two o'clock in the morning reached the farm-steading of Winkston. There, without leave, and in sheer desperation, they took refuge in a barn among straw, in which they buried themselves and fell fast asleep.

At this point they were within a mile of the Clay House, and if it was their intention to push their way thither, the feat might have been accomplished by turning down a byway to the right. For the time being they enjoyed some repose in the barn at Winkston. Here was an opportunity, such as seldom occurs, for a man doing a kindly act to houseless and forlorn strangers—criminals they were not—offenders in any degree they were not—but victims of a war into which they had been dragged by conscription, and whose heroic efforts to escape, as well as their destitution and sufferings, were enough to rouse the feelings of any one with a spark of humanity. The farmer was a person of a coarse nature—anything but a favourable specimen of the tenants in the district. When in the morning he was informed who were his guests, he proceeded to take a look of them in the barn, and found them to be in about the most abject condition possible to be endured by human beings. Did his conduct resemble that of the good Samaritan? Quite the reverse. Roughly, he asked them why they were there. One of the party, who could speak a little English, earnestly besought shelter for a few hours and something to eat—they would pay for bread and milk. Without a word in reply to the sad appeal, the farmer sullenly turned the key upon them—locked them up in their agonising distress—left them, it might be, to die. He forthwith despatched news of their capture to the military at Penicuik, and had the miserable satisfaction of delivering up the whole to a company of soldiers. How this hard-hearted man—whose name I suppress—was for years afterwards execrated throughout the neighbourhood! Conscious, perhaps, of the disrepute into which he had fallen, on account of his cruelty to the poor Frenchmen, he shrunk into a gloomy recklessness of character. The simple people about said he was 'under a feydom'—a familiar Scottish phrase only to be translated by saying that he was 'under the dominion of fées or fairies,' something supernatural. At all events, this unhappy person had a dismal ending. One night, he madly attempted to cross the Tweed

on horseback at a particularly dangerous ford, when the river was roaring 'from bank to brae' in full flood, and was swept away and drowned.

In the deplorable condition already described, the party of French prisoners reached the little town, and, as has been said, were secured in the county jail. Refreshed with food and a night's rest, they were brought out of the prison in the morning about nine o'clock, and by the military officer in command were ordered to march back to Penicuik. From the crowd of boys and townsfolk who were spectators of the scene, there arose something like a cry of horror. The unfortunate wretches could not march; they could barely stand; and piteously implored compassion. Deschamps, who had figured as a leader, presented a sight which is fresh in my remembrance after an interval of more than sixty-four years. Drawing up the leg of his ragged trousers, he, with dramatic gesture, called the officer's attention to the state of his limb. It was a universal ulceration. Though speaking in French, he required no interpreter. The words were the voice of nature, which all could understand. The officer felt the force of the appeal. He ordered carts to be procured. There was accordingly a lull in the proceedings until the carts and horses made their appearance.

Let us, if possible, picture the grouping on the occasion. In the centre, in front of the jail, stood or sat on the street the woe-begone prisoners. Hanging about on their skirts, but ready for action, were the soldiers, the officer with sword drawn pacing backwards and forwards. Outside, at a respectful distance, were the miscellaneous onlookers. Among these was May Ingram, a tall woman of masculine character, who, though married, was known only by her maiden name. In the 'dear years,' she had headed a meal-mob. Yet May, with all her exterior roughness of character, had in her the milk of human kindness. On this memorable morning, she put to shame persons of higher pretensions. Perceiving that Deschamps was helpless, and suffering from a frightful sore, May rushed away to her poor home in quest of rags and emollient salve; and returning in time, bound up the wound, and aided in imparting a degree of comfort to the unfortunate Frenchman. The carts arrive. The cavalcade moves off, and we see it disappear round the corner at the east end of the town, on its way to Penicuik. In the throng who linger behind, May Ingram pathetically expatiates on the nature of her surgical operation and the sufferings of the poor creatures generally. French as they were, she observed, 'they were aye somebody's body!' Looking back on this occurrence in my boyish days, the painfulness of the recollection is assuaged by a remembrance of this poor woman's truly Christian act of charity to a totally friendless being.

The next time I visited Penicuik was long after the conclusion of the war. The site of the prison was entirely changed in character. It was a scene of peaceful and prosperous industry, consisting of the extensive paper-manufacturing works of the Messrs Cowan. Around it were still the woody banks which had been the scene of the extraordinary escapade of the band of *détenus*. Near the foot of the bank was seen among the trees a handsome monumental structure, erected almost entirely through the munificence of the late Alexander

Cowan, a man noted for his generous yet unostentatious benefactions. It bears an inscription in English and French, with a line in Latin from a Roman poet, believed to have been suggested by Sir Walter Scott. We read with interest, as follows :

The mortal remains of  
309 prisoners of war,  
Who died in this neighbourhood  
Between 21st March 1811 and 29th July 1814,  
Are interred near this spot.

*Grata quies patriæ, sed et omnis terra sepulchrum.*  
[Grateful is it to repose in one's own country, but all the world is a tomb.]

Certain Inhabitants of this Parish, desiring to remember that all Men are Brethren, caused this Monument to be erected in the Year 1830.

*Près de ce lieu reposent les cendres de  
309 prisonniers de guerre,  
Morts dans ce voisinage  
entre le 21 Mars 1811 et le 26 Juillet 1814.*

*Nés pour bénir les vœux de vieillissantes mères,  
Par le sort appelés  
À devenir amants, aimés, époux, et pères,  
Ils sont morts exilés.*

Plusieurs habitants de cette Paroisse, aimant à croire que tous les hommes sont frères, firent élever ce Monument l'an 1830.\*

W. C.

## WALTER'S WORD.

### CHAPTER XLVIII.—HOMEWARD BOUND.

FOR a few days after the return of the captives, it seemed probable that Walter would have lost not only his plighted bride, but her also to whose loving arms she had bequeathed him. The knowledge of her father's sufferings in the brigand camp, and of the fate which he had so narrowly escaped; her rival's death; and the disclosure of Reginald's perfidy, had so tried Lilian's feeble frame, that it almost lost its foothold upon existence. For weeks she lay, prostrated as before, and only able to see Walter for a few minutes; and it was well nigh winter before she could get about, and, leaning on his arm, face the mild rigours of the Sicilian air. In the meantime, he was, of course, thrown much into the society of Mr Brown, who seemed as though he could never sufficiently shew his contrition for having so unjustly banished him from it, upon that memorable evening at Willowbank. The merchant had recovered his old ways and habits of command with miraculous elasticity with respect to other people, but to Walter he never failed to exhibit a deferential as well as an affectionate regard. It was, however, expressed in a characteristic way; not demonstratively as to words and manner, but in a sober practical fashion, such as

\* Near this spot repose the ashes of 309 prisoners of war, who died in this neighbourhood between the 21st March 1811 and 26th July 1814.

Born to bless the affections of aging mothers, designed to love and be loved, to become husbands and fathers, they died in exile.

A number of the inhabitants of this parish, happy to believe that all men are brethren, caused this monument to be erected in the year 1830.

became a pillar of commerce. 'I had never believed,' said he one evening, as they were smoking together on the veranda of the hotel, 'that the phrase, "His word is as good as his bond," could be taken in a literal sense; but you indeed have proved it to be so. That you should have come back again from all this life and liberty'—he pointed to the swarming Marina, and the sparkling bay that bordered it, flecked with many a sail—to death and torture, just because you had given your promise to do so, without an inch of stamped paper, is a very fine thing, my lad. I had come to know you better by that time; but yet I never thought so well of you as to believe you would have returned empty-handed to that den of thieves.'

'Well, as to my word being as good as my bond, Mr Brown,' answered Walter, laughing, 'that is not so great a compliment as it seems, for I fancy my bond would not be worth much.'

'It would be good for fifty thousand pounds, my man,' observed the merchant gravely.

'How so, Mr Brown?'

'Because that is the sum I am going to give you and Lilian for your marriage present. Why not, sir? If I had escaped Corrali's hands by any other means save those you contrived for me, I should have paid the money into the brigand treasury; and surely one may at least prefer to put it in the pocket of an honest young Englishman. Then the saving my life may be reckoned as some value received, I suppose; not to mention my daughter's life, which, had I been put to death, would, I verily believe, have been sacrificed. Moreover, I am under an immense obligation to you for unmasking that scoundrel, Sir Reginald. What a pretty existence he would have led poor Lotty, and how all my hard-earned gains would have been frittered away on the race-course or the gambling-table, if it had not been for you, my lad! No, no; I won't have a word of thanks, for the obligation will still be upon my own side, after all is done. Pooh, pooh! The money shall be settled upon Lilian and her children, then, if you wish it to be so; though there will be plenty more for them, I daresay. What's hers will be yours, you know, and being a prudent young fellow, I daresay you'll find the income sufficient.' And Mr Christopher Brown chuckled, as, at one time, not so long ago, and in a certain locality, now white with snow, which he could almost catch sight of from where they were sitting, he had hardly thought to chuckle again.

'Have you heard anything more of Sir Reginald, lately, sir?' inquired Walter, after some more talk to the same effect, in which the baronet's name had again been mentioned.

'Yes; I have had a telegraph from his lawyer, inclosed from Naples, this very day: "*My client accepts the terms proposed to him, and will give the undertaking required.*" Of course he will. So long as he gets his thousand a year, paid quarterly, he will be content to remain separated from his beloved wife. She will be free enough from any molestation from him, you may depend upon it.'

Walter nodded, and sighed; he was thinking of the old times when Reginald Selwyn had been a hero in his eyes at school and college. Had he been base from the beginning? he wondered. Was it a false glitter that had dazzled all eyes concerning him, or had his nature deteriorated from circumstances? Had want of money made him value it

too highly? and when fortune seemed to be within his grasp, had he been unable to resist the temptation to snatch at it? He had been always selfish, and somewhat hard, but surely not so heartless and cruel as these last days had proved him to be. Nor could Walter forget the impulse of old friendship that had caused the wretched man to follow him along the Marina yonder, as he went to his doom, and strive to save him from it—though only by making him partaker of his crime.

'I am afraid,' sighed he, 'Lotty will not receive this news with the same satisfaction as yourself, Mr Brown. After all, this man was her first-love.'

'First fiddlesticks!' exclaimed the old merchant impatiently. 'You would try to persuade me that my daughter is a fool, to my face! What has she ever got from this man but hard words and insults? Why, I have seen her start when he spoke to her, as though a gun had gone off. No, no; if first-love ever lasts for ever, man, it is only when one has had no experience of it. Not that I mean to say you will soon get tired of Lillian, you know; that's quite a different matter.'

'Indeed, sir, I think that I shall not do that,' answered Walter, blushing; for he could not but reflect who had been his first-love, and how it would astonish his future father-in-law to learn that it had not been Lillian, but that counterfeit presentment of her (as she had been), her sister. Ill-usage, and the destruction of her brightest illusions, had altered poor Lotty, indeed, since that memorable occasion when he had travelled in her company to Penaddon; but, for the moment, he seemed to see her as she had looked that day.

'Has Sir Reginald returned to London?' inquired Walter, after a long pause, during which, both he and his companion were deep in thought.

'No,' replied Mr Brown; 'or, rather, he did return, but found the place too hot to hold him. The news of his conduct here had arrived before him. I hear, from one of my correspondents, that he was cut at his club, which, it appears, is the severest chastisement society can inflict, though I daresay he is too thick-skinned to feel it.'

'You are wrong there, sir,' answered Walter gravely; 'that is just what he would feel—the very punishment, of all others, under which his undoubted courage would not sustain him.'

'Still, it would have been more satisfactory to learn that he was hanged,' observed the old merchant grimly; 'instead of which, he has only been transported.'

'Transported! How do you mean?'

'Oh, I forgot I had not told you. He has gone to live in Paris, with—with—it was Mr Brown's turn to blush now, and he did it in a very unmistakable manner—'with that aunt of his, of whom we used to see so much at Willowbank, Mrs Sheldon. There must be something good about that woman, to make her thus stick to him in his disgrace, and give him what countenance she can.'

'Doubtless; yet I think she was a designing woman.'

'Very likely,' answered Mr Brown dryly; 'widows often are.'

Then there was another pause, even longer than the preceding. 'Walter, my lad,' observed the old merchant, as he threw away the end of his cigar, 'what on earth was it made you come to Sicily?'

'Well, sir,' answered Walter, smiling, 'I was ad-

vised to do so.' Of course there would have been no harm now in confessing the true reason for his exodus, but that would have reopened the whole matter of Reginald's ill conduct—the suspicions that Lillian had entertained of him, &c.—and the topic had been already sufficiently debated.

'Advised? What! by a doctor, do you mean? Considering how fortunate the issue has been for me, I think he deserves a fee.'

'Well, no, sir; it was not a doctor, but a very good friend—a painter. If it had not been for his suggestion, I certainly should not have had the opportunity of doing you the service which you are pleased to value at such a fancy price.'

'Then that man's pictures shall never want a buyer,' cried Mr Brown excitedly. 'What's his name and address?'

'His name is Pelter, and he occupies lodgings in the same house with me in Beech Street. He is a very good artist, though by no means a very successful one; his style'—

'I don't care what his style is,' interrupted the merchant in his old arbitrary way, 'for I mean to like it, whatever it is. I shall buy what he can't sell, and give him orders for all he paints for the future. If he is your friend, my lad, he is my friend, and I shall make a point of patronising him.'

'Indeed, sir,' answered Walter, smiling, 'I hope you will not attempt to do that.'

He had a letter from his friend, in his pocket, at that very time, the second he had received from him—though Jack was as dilatory with his pen as with his brush—since the Corrali affair had been noised abroad; preaching Bohemianism and independence of all sorts, with a private and particular exception in favour of a man who had won an heiress, as a simple knight of old might carry off a king's daughter in a tournament, by his courage and conduct among brigands. 'I was convinced, my dear Walter, from the first, that, sooner or later, you would swerve from the faith, and become a domestic character. You will have trouble in the flesh—not to mention the spirits—but I spare you. I believe nature intended you to be a married man in what is satirically termed "easy circumstances;" nor should I be surprised to see you (afar off) glistening in the sun, even as those who wear polished boots in the daytime. It is the privilege of some, whose friends have been thus turned away from them, to become godfathers to their children, but I am afraid I am hardly fit for even that connection. Still, there will be a link between us, old friend, though it may not be publicly acknowledged. I am indebted to you for many an hour of "sweet companionship," the memory of which will always be a treasure to me; the old house here is desolate enough without you, and I dare not go into your rooms; yet it is well for me that I have known and loved you. But "this is sentiment, sir," as old Tintac says, when he has concluded his bargain, and can eulogise "a picture of the affections," as his own. Talking of pictures, Nellie Neale has been here to break to me the news that she can no longer be a model, except of the domestic virtues. She is going to be married to a respectable young fellow in her own rank of life, with which prospect she bids me tell you she is quite content. This is to me a "dark saying," unless, indeed, she flatters herself that she might have had Walter Litton, Esq. for the asking. With

that young gentleman, it seems it is always Leap-year. Your relations with the Self-made One are indeed a subject for congratulation, and must have afforded you enormous opportunities; surely, surely you have not neglected to take sketches of him when in captivity. Let me suggest a series—*Corralli after Brown: Brown before Corralli: Brown on the Mountain; a Storm: Brown in female Brigand Costume, escaping: Brown laid lifeless by (the wind of) a Musket-bullet.* Keep these by you in the rough; and if anything should disturb your present relations with him, threaten to touch them up—in which my assistance may be of some service, and publish them. *Verbum sap.*

This was a letter, though very significant of the writer, which Walter could hardly shew in its entirety to Mr Brown, so he confined himself to a *viva voce* description of his friend's characteristics.

'I see,' observed the old merchant good-humouredly; 'this young gentleman is as proud and independent as his friend; he will have no patron but the dealers, won't he? Then the dealers shall buy them—for me.'

The old merchant was as good as his word. It was most surprising—and to no one more than to Jack himself—how very much the demand for Mr Pelter's pictures increased among the trade from the spring of that date; the effect of which did not much appear indeed in the attire or mode of life of that modest artist, but was very perceptible in the furniture of his studio; for, partly hidden, partly bulging forth under the folds of a picturesque Spanish cloak, hung low, for the purpose of concealing it, was always to be seen in that apartment a vast circular object bound with iron hoops. Jack took in his stout by the barrel.

His apprehensions of a separation from his friend, let us add, were altogether without foundation. Lilian was by no means one of those women who exhibit their devotion to the object of their choice by isolating him from all whom he held dear before his marriage; she made his friend her friend, and bound her Walter closer to herself, if that were possible, by that new tie. Jack was a frequent and welcome guest at Willow-bank, and had at least one prejudice in common with its proprietor: they stood shoulder to shoulder against the practice of putting on evening attire, except on very great occasions. At dinner-parties in the dog-days, Mr Brown was compelled to wear black broadcloth, whereas Jack sent his excuses, and sat at home in his shirt-sleeves, with his kind heart full of pity for the victims of society. He had the run of the house, except one Bluebeard's chamber, in which were hung his own pictures, until one day a great City magnate, who knew what was good when he saw it, even out of a soup-tureen, offered to buy the whole lot for twice the fancy price that his host had given for them. Mr Brown hesitated as to whether he should sell, and send the difference by cheque to Jack—which would probably have cost him his friendship. As it was, he adopted another plan. The next time Jack came, he was shewn into that very room, and just as his brow was getting black with pride and shame (for he guessed all in a moment)—'No wonder you are rather moved, Mr Pelter,' said the old gentleman, 'for I could make fifteen hundred pounds by those pictures to-morrow. However, old Ingot has taken

a fancy to your works, and I reckon I shall never get another bargain out of you again.' A remark which had not only delicacy but truth to recommend it, for there is now many a R.A. whose signature on canvas counts far less than that of plain Jack Pelter. 'It is as good as my name on stamped paper,' boasts Mr Christopher Brown, 'or as our Walter's word.'

But we are sadly anticipating matters. These things occurred of course long after the two chief personages in the history had been made one.

In the early spring-time, when the flowers were thick upon the grave of Joanna, which was in the very spot which he whom she loved had at one time thought himself to rest, Walter and Lilian were married. It was a very quiet wedding, and yet it was a double one, for Francisco and Julia were united on the same day; nor did the merchant forget the share which the young Sicilian had had in effecting his release from captivity, or that his bride had been Lilian's tender and faithful nurse for many a weary week. Her place as attendant upon Mrs Walter Litton was supplied by a handsome young woman, wearing the garb of woe, which, however, became her admirably, and who was not so prostrated by the loss of one swain but that she had already given hopes to several others that they might occupy his shoes. A more charming *soubrette*, in fact, than Lavoeca was transformed into—nor a more modest one withal, in spite of her little flirtations—it would have been difficult to find. She left, however, all native lovers despairing, and stepped on board the *Sylphide* fancy-free. The whole party went straight to England in the yacht, their original idea of visiting Rome being abandoned. In vain the banker and other English friends painted the beauties of Italian scenery, and the interest of classical antiquities, in the most attractive colours, as also the safety of the high-ways and railroads. There were brigands in Italy as well as in Sicily, and Mr Brown was resolved to run no risks. The state of Lilian's health had alone detained him thus long upon foreign soil, and he was heartily glad to quit it. He had lost, not indeed fifty thousand pounds, he was wont to say, but still a good many pounds—of flesh—while partaking of the hospitality of Captain Corralli, and his health needed to be recruited at home.

Let us take a last look of our friends as they stand upon the deck of the *Sylphide* and wave their hands in farewell to those upon the quay. The consul is there, who strove so gallantly, although in vain, to assist poor Walter in his strait, and who has long got to know and like the young fellow; the banker also, at whose hospitable table—though he little thought to have been able to accept an invitation from him—Walter has often dined, and talked over with him that matter of the 'Brown Ransom,' which is to this day the stock story of the house of Gordon. Francisco is there with his new-made bride, and kisses his brown hand in graceful good-bye, while she sheds silent tears. Signor Baccari is also in tears, by no means silent ones, but his grief at the departure of his lodger is no less genuine than demonstrative. Again and again he commends Walter to the protection of the saints, and bids him beware of brigands—a baleful product, which he fancies to be indigenous to every soil. The yacht is loosened from her moorings, sail after sail clothes her delicate spars, and off she glides towards

England. The figures of those upon the quay grow fainter and fainter, till only the fluttering kerchief can be made out which marks Julia's presence; but the noble hills which are being left for ever are still discernible. To one of these, that stands up straight and sheer to eastward, Walter points in silence, and presses Lillian's arm.

'Yes; that was once my prison,' she answers, for in it was Joanna's cavern. 'I do not, however, regret my captivity, since but for it you would not have been mine, Walter.'

Here she pauses, gazing up into his face with inexpressible love; then, as if remorseful for forgetting the woes of others in her own exceeding happiness, her eyes wander to Lotty—husbandless—deprived of what she has gained. 'She is happier thus, than she could ever have been with him,' whispered Walter, in answer to her thought. And indeed, as she stood smiling cheerfully, with her hand upon her father's arm, and in loving converse with him, it might well be hoped that that well-nigh broken heart would heal.

THE END.

### THE FLORA OF MADAGASCAR.

THE forms under which life manifests itself in the great African island excite deep interest in the mind of the naturalist. He who visits it after having explored Africa and India, will find himself in a new world; the plants have a peculiar aspect, often of a type which is unknown in other countries. When the traveller lands at Tamatava, his attention is at once arrested by the beauty of the trees and strangeness of the plants. The ground is one mass of verdure; bushes and reeds spring out of the tufts of grass, cocoa-nut palms rise to a great height, and the mountains bathed in blue vapour complete the picture. Lemon-trees—peculiar to the country—offer a welcome shadow from the heat; the Indian acacia showers a profusion of its yellow blossoms; the beautiful *lochnera*, allied to the periwinkle, throws out its long stems, terminating in a mass of rose-coloured flowers; and the *Palma christi* displays its large leaves, sometimes green, sometimes purple.

On the shore, the *Pandanus* attracts attention, trees of a singular appearance, abounding in the marshy parts of Madagascar. They possess large roots, which issue from the trunk up to a considerable height, in appearance like ropes, and attaching the stem to the ground. The wood is very poor, with a smooth bark, and long pointed leaves; one kind bears clusters of sweet fruit, which the natives hold in great esteem; this species grows to the height of twelve or sixteen feet, with the leaves at the top spread out like a parasol. In most damp places grows the kind of palm which is invaluable to the inhabitants—the *Sagus*, or sago-tree. When old and dry, the leaves cover their huts; when young and tender, they are made into mats and ropes, and also form an excellent food. From the interior of the trunk the starch is extracted known through the world as sago.

Near the rivers, or in damp valleys, the eye is enchanted by the splendid foliage of the *Ravenala*, or traveller's tree, one of the most characteristic representatives of Madagascar. Truth and error have alike made a poetical legend of it. When it is spoken of, the imagination pictures the exhausted traveller dying from the agonies of thirst, restored

at once by the pure water of this tree. Alas for this fiction! it only grows where there are plenty of springs. Sailing on the river Jarouka, and stopping to climb the hills, a beautiful landscape presents itself to the eye: the ravenalas cover all the valleys, some rising to the height of thirty feet; and at the top of the strong stem, a gigantic fan spreads out, of fifteen, twenty, or twenty-five enormous bright leaves, on stalks from two to three yards long. Between these, a few branches appear, bearing flowers and fruits; the latter, on opening, shew about thirty seeds wrapped in a silky envelope of a bright blue or violet. The reservoirs of water are very simple: the rain which falls on the leaves runs down a trench in the flower-stalk; these are large at the base, and retain the liquid. When this is pierced with a lance, a stream runs out, and the natives at work in the heat, draw from this source, to save the trouble of going to the neighbouring torrent. It is, besides, a most invaluable tree: the leaves are made into plates and cups; they serve to cover the roofs and walls of houses; the bark is made into planks, and the trunk into beams. Unique of its kind, those who have seen the Malagaches use it say it should be named the builder's tree.

On the edge of the forests the *Strychno* is generally to be found, its poisonous seeds furnishing the alkaloid but too well known as strychnine. There is, however, one kind which bears fruit about the size of the quince, wrapped in a hard envelope, the sweet flavour of which is much prized by the natives. It is on the borders of these forests that the botanist will stand in ecstasy before a wondrous sight. Over the old trunks, or on some decayed tree, fall long stems of large and strange flowers, orchids of the genus *Angraecum*. They take possession of the trunk and branches, bury their roots in the bark, throw out gracefully twined stems, with two rows of bluish-green leaves, and four or five flowers unequalled for beauty, firm as wax, of milky whiteness, and a spur like an enormous tail about a foot in length. Here, too, are the passion-flowers, with edible fruits; some growing as shrubs, others as climbing-plants, having magnificent violet flowers, and seeds as large as eggs.

In the larger forests, the superb trees, unknown out of Madagascar, towering above all the vegetation around, are the *Chrysopias*. The top is spread out like a parasol, and the branches terminate in bunches of flowers, formed of five petals, of a dazzling purple, contrasting admirably with the foliage. When the bark is cut into, a yellow juice flows abundantly, which thickens when it comes in contact with the air, and makes an excellent resin for fixing knives into the handle. Out of one of the trunks of this tree the Malagaches make a pirogue, or boat. Everywhere on the eastern coast there grows a tree of remarkable elegance, with panicles of small rose-coloured flowers; it is the *Taughinia*, the most dreaded tree in the island. The fruit furnishes a deadly poison.

As a general rule, aquatic plants of the family of *Naiades*, so widely spread over the streams and pools of Europe and Asia, do not attract particular attention; it is necessary to go to Madagascar to see a very remarkable specimen of this type. In the torrents and streams near Tamatava grows the *Ouvirandra fenestralis*—according to Sir William Hooker, the most curious production of nature. It

has thick roots, extending in all directions, and forming numberless crowns; from this base rise tufts of large leaves, which float on the surface of the water, supported on stems longer or shorter in length according to the depth of the stream. From the centre of these rises a stem in the flowering season, which divides into two, and bears small red flowers. The leaves are real specimens of living lacework, graduating through every tint, from the palest green to the darkest olive, and give to the plant its singular beauty and strange character. The veins in them are disposed with regularity, and look like the frames of well-lighted windows. During the dry season, the whole withers away, only to spring up again when the rains pour down, and the torrent rushes along. It furnishes to the natives a good vegetable, the root being much esteemed. For a long time this plant was believed to be unique in its peculiar class; but about thirty years ago, M. Bernier, an ardent student of natural history in Africa, met with a second species, though much less singular in appearance; and a third kind has since then been observed in Senegal.

In the eastern part of the island, where rivers are abundant, the traveller often comes upon most delicious landscapes when the morning sun shines upon them. Green water, the banks covered with beautiful flowers, small scattered villages, trees reflected in the lakes, palms, and every variety of fern, with the fresh dewy meadows, make up an enchanting picture. Besides the reeds and aquatic plants which abound, is a curious type discovered by M. Petit-Thouars, who named it *Hydrostachis*. It consists of a tuft of leaves hanging down into the water; from the centre rise stems of small flowers arranged like ears of corn. Of a very modest appearance, they require the eye of a botanist to perceive the difference existing between them and the forms found in other countries. The well-known and exquisite blue African water-lily is spread in profusion over stagnant waters. As in India, the bamboo occupies a large place; near the shore, at the least breath of wind, these slender canes bend, the long leaves are agitated like feathers, and a sort of shiver seems to pass through the entire field.

In the more desolate regions where sandy plains stretch far away, trees are few and stunted, but there is something to interest the botanist even here. Beside the aloe, grow varieties of the caper tree, one having leaves of a brilliant green, spotted red stems, and white flowers; another, covered with a woolly down, bears yellow flowers. On the chalk hills grow *Dombeyas* and *Bignonias*, which have not been found in any other land. Even in this sad region M. Bojer has discovered a splendid tree, the *Colvillea*, unique of its kind. It reaches the height of twenty yards, with an elegant foliage, the crown of branches clothed with red bark spotted with brilliant scarlet; the flowers, hanging upon red stems, are grouped in splendid clusters, of a yellow orange shaded with purple. The effect is truly magnificent.

After climbing the hills near Maroumby, the forest of Analamazaotra is reached, which passes through the whole centre of the island, varying in width. Trees, shrubs, creepers, ferns, plants of all kinds, are here massed together, and form an impenetrable thicket. Where man has cut a road, ravines, marshes of mud, quagmires, lakes, precipices, and

rocks, make the work most painful. In the presence of this sublime disorder, the luxury of vegetation spreads shade and freshness, or, at intervals, permits the bright rays of the sun to penetrate. Without doubt, many new specimens would be found here by the side of those well known to other parts of the island, but no botanist has yet installed himself in a grotto for a season or two to study this rich entanglement.

A different aspect altogether is described by the few travellers who have scaled the hills, crossed the great central forest, and reached the highest summit of the chain. Here, it seems like a different land; palms and ravenalas have disappeared with all tropical vegetation; the height above the level of the sea is considerable, and the climate is that of the temperate region. Nevertheless, the uneven soil and heaped-up rocks produce a grand effect; and when the highest point is gained, an imposing sight astonishes the gazer, as the immense plain of Ankay, bounded by two chains of mountains, stretches before him. When a brilliant sun lights it up, and strongly defined shadows bring out the smallest details, the panorama is magnificent; the eye rests on the village of Mouramanga, where the different roads meet; these, like a ribbon of ochre, cross the valley, and winding round the sides of the hills, appear again in the distance as a golden thread till lost in the blue mountains.

The *Cratæva excelsa*, thirty yards in height, grows in the mountains, and is a magnificent tree, of the caper family. Strength, grace, and beauty unite to make it a splendid addition to this richly dowered land. At the base the trunk is nearly two yards thick, and at the top the branches extend in a nearly horizontal line; the leaves are of a bright green veined with red; whilst the young shoots are altogether purple, and wave under the slightest breeze upon their long thin stalks. At the season of the year when the foliage is in its greatest beauty, the clusters of flowers appear of a pale scarlet rose tint. The natives use this tree to cut very wide planks for shutters. The *Astrapea cannabina*, which is distinguished by large oval leaves and white pendent flowers, is very common in the mountains, and is valuable, as the bark takes the place of hemp.

For several centuries past the Malagaches have cultivated rice in many varieties; it is supposed to have been introduced by the Arabs, and grows well in the low grounds, as also on the hills. The ignama, with its enormous roots, is most valuable as a vegetable. It is of the same family as our wild arum, but grows to a great height, with large leaves and pretty flowers, producing a good effect when grouped in masses near a picturesque site. Cultivated from time immemorial in India and the South Sea Islands, it is probably from thence that it has been transplanted to Madagascar, as well as the great cardamom, which has become so abundant, a beautiful plant, bearing very elegant flowers and scarlet fruit, with a slightly acid and agreeable flavour.

Nature has here bountifully supplied the native with all his simple wants: he can gather fruit and dig up roots for his food, and procure leaves and bark, which supply materials for his dress, with wood for his dwelling. The strangeness of the vegetation of Madagascar would almost lead one to believe that this island has never been united to

Africa or Asia ; though so near to the former continent, it has few resemblances to it, and may be considered as vying with the tropical richness of Asia.

### MORLEY FELL.

#### IN TWO CHAPTERS.—CHAPTER II.

SCARCE had he set his foot upon the fell, than, issuing like shadows from the wood he had so lately left, there came forth two men, speedily joined by a third.

'Well, Bill,' muttered one of the two to the last comer, 'this is a rum go : our game's gone to earth somewhere.'

'Ay, curse him! the bird's flown,' responded Bill, who was none other than our former acquaintance, the master of the deceased Sandy. 'I tould thee we suld be o'er late ; but I'll be even wi' em yet.'

'Hist!' whispered the third man, clutching Bill by the sleeve, and pointing towards the fell.

'By —, there he goes!' uttered Bill in great excitement. 'Noo, ma lads, let's all slip awa to th'ould wall. We maun keep together; he's a devil to deal wi'.'

Without more ado, they soon gained the wall; and had Harry gazed more earnestly, on looking round, he would have seen them half-concealed, just about to slip over it. On they went; they reached the fell; step by step, each choosing his own path, up the side they crawl, carefully picking their way, and pausing to rest only behind the larger boulders of rock here and there jutting out. They are desperate men, bent upon a desperate task. Revenge pure and simple actuates one man—he is Billy. He had easily induced his companions—his companions in more than one outrage which might have sent them all swinging—to join him in his plan, a plan which promised them some fun, and which, at anyrate, promised one of the three the possession of a good breech-loader. And now they are but a short way below him. O warning instinct, warn him once again! But instinct now is quiet. Ah, nothing now can save him! On they stealthily creep, those lawless men. God alone knows what treatment Harry will experience at their hands. How must his guardian angels with pitying eyes look on, that one so young, so promising, should die. Can nothing save him? God alone can save him now. Then let us be content; if God is for him, who can be against him? Harry is climbing unconsciously but pretty vigorously now; but the men are gaining fast upon him. Already they are pausing for a supreme effort, before they make their rush, when, in the providence of God, Harry, in scrambling along, loosens a large stone; he nearly slips, but recovering himself, turns to see how soon in mad career it may reach the bottom. An instant more, and he had been too late. With a startled shout of alarm, he sees two men only a couple of yards below him, and had he not by some half-dozen springs, light and rapid as the chamois, leaped into comparative

safety, they would have had him in their grasp. In that one glance he had seen enough, and more than enough, to convince him of his dangerous position. In the upturned face and vindictive eyes of the man just below him, he recognised clearly enough the villainous features of his old antagonist; and now, as he rested for an instant to get his wind, he saw not only one but three men straining every nerve to come up with him, and heard their eager shouts as they followed in pursuit. Recovering his breath and his nerve at the same time, he now turned, and commenced to climb steadily, knowing the fatal consequence of one false step; he tried hard and successfully to steady his nerves, and husband his strength by not giving way to hurried haste. So on they scramble. His heart beats quicker as he feels that they are rapidly gaining on him; he is fast losing wind and courage, for, as they struggle panting nearer and nearer, he can tell that they mean no play.

Suddenly his foremost pursuer halts, apparently almost beaten. Now is Harry's chance once more to collect himself. He immediately sits down, facing the man below him, and pulls out his flask—empty—every precious drop gone! Billy eyes him without speaking, but with the ferocity of a wild beast. Harry wisely does not waste his breath in talking. Billy is the first to move, followed by his companions; he does not plunge away now as he did at the beginning of the chase, but quietly and yet with speed works his way up. Harry too sets himself deliberately to work; he knows that his only chance now is to gain the top at least a minute before the men come up, for he has already had experience of the way in which hill-men can in an incredibly short time make their way to the bottom again. A very awkward and abrupt piece of climbing comes now, which Harry at any other time would have gladly shirked; but the difficulty is past, and he turns with a degree of assurance he has not felt before to see if it will in any way damp or hinder his pursuers' ardour, while he gains once more his breath. His breath is nearly all knocked out of him again, though, by seeing his pursuers strike off to the left, and climb with redoubled vigour and seeming ease a path circling round the projecting rock, and which he wonders that he missed seeing. It was evident the men knew their ground, and poor Harry shuddered to think of the consequences, if, by unforeseen difficulties, he is at length brought to bay. The weary chase once more proceeds. Harry rather sickens at the thought of being hunted in this way, and I am proud to believe his statement that in that awful hour he thought of and wished for me. He could hardly credit his senses—Londoner as he was—that all this was taking place in England. Once more he halts, and planting himself firmly on the ledge formed by a sheep-run, he awaits the human hounds running steadily on the trail. For the first time he challenges Billy as he draws near, and aiming his gun, cries: 'Stop! If you come on, one of you must die.'

Billy's comrades pull up, but only for an instant. 'Gun ain't loaded,' he sputtered out, knowing that Harry would have used the same persuasion long

since, if the piece had been really charged. Harry seized the gun by the muzzle, and whirling it over his head, threatens a smashed brain-pan to the first who comes within reach; his higher ground too makes him look formidable. But the undaunted Billy, signing to the two ruffians beside him to climb up right and left, creeps a little closer, but quite out of Harry's reach. This was too much for Harry: that three men should make a simultaneous attack upon him on all sides in such a place must be fatal to him, he knew, should he manage to dispose of even one or two of his antagonists. He turned and fled. Once more he struggles gamely on; he nears the summit—the top is gained; no: the fell rises up still higher. His throat is parched, his legs feel not his own; climbing, and such a climb as this, they have not been accustomed to. Faint and in despair, he almost gives up; the thought of Maud, however, comes to help him; while there's life there's hope; he springs to his feet, and now the real summit is close by. With hands bleeding, clothes torn, blinded by his terrible exertions, and scarce hearing, with a terrible singing in his ears, another feeble struggle lands him on the top. At full length he lies for a few seconds, while the cold breeze invigorates his exhausted energies, and then, with a murmur of thanks to God, he hastily crosses the ridge, about thirty yards broad. As he sees the huge stones and fragments of rock scattered here and there, he has thoughts of trying the effect of hurling them upon the wretches below; but again thinking that they must be close upon him now, and feeling quite unequal to the desperate task of settling three men in as many minutes, he dashes to the other side, and steadying himself by sitting on his heels, he begins to slide at a good pace down the slope, made slippery by the short and stunted grass. No sooner had he got well under weigh, than his pursuers reach the top on the other side, and despite their anxiety to commence the descent, where, from greater practice in sliding, they hope at length to attain their object, like Harry, they are compelled for a minute to stop, before they resume the chase. On glancing below, Billy chances to see poor Harry in difficulties. He had been sliding along fairly well, when the ground suddenly became rougher, and loose stones more frequent; he was compelled, therefore, to assume an upright position, and scramble down as best he could; but as every one knows who has tried it, it is easier to start than to stop when once one has set off. Harry was delighted at the rapidity of his new motion, as compared with the slower rate of sliding; he had good legs, and kept his feet where many would have lost them; but faster and faster he went; his strides down the fell-side were almost ludicrous, had they not been so dangerous. In vain he tried to moderate his pace; he went like the wind; he felt in another instant that he would be dashed to atoms; his only chance was to throw himself backwards. This he barely accomplished, for he was almost powerless, but his heel catching in a small tuft of gorse at the same moment, he spun round like a top, and turning a few somersaults, he only came to an anchor by laying hold of another tuft. He felt himself terribly bruised, and out of breath; and perceiving a warm something gushing down his cheek and neck, he found, by putting up his hand, that the hard rock had inflicted a fearful wound upon his scalp; he had

a large gash too upon his forehead. Billy from above scarcely observed all this, before, with the swoop of an eagle, he rushed upon his prey; the other two men evidently feared a like catastrophe with that of Vernon, if they shewed too much haste, and they felt that the matter was secure in Billy's hands. On looking up, Harry saw that he must arouse himself, or all would soon be over.

The ground was here smoother, and he tried the sliding down again, directing his course towards his gun, which had been hurled from his grasp by the fall. Scarce had he seized it as he swept quickly by, than, by the stones and rubble which tumbled pell-mell past him and upon him, he knew that Billy in another second or two would reach him. O Harry, you have struggled nobly; do not give in now! But Harry's progress not only becomes slower; he suddenly stops, comes to a regular stand-still as he crouches on a little patch of furze. He must be lost. Billy, excited, furious, triumphant, comes like a thunderbolt upon him. Why, the very shock of a heavy man like that would simply smash him. At the very moment that Billy, with the spring of a tiger, actually launches himself in the air in his furious downward course upon the very spot, Harry, by a slight movement to one side, is saved. Billy makes a convulsive clutch at him as he goes crashing by, and then, after a couple of somersaults in the air, comes down with a heavy thud, and lies motionless and still. Harry is upon him in a second, and, with upraised stock, is about to give him his quietus, sufficient at anyrate to put an end to the pursuit, when, starting from the fallen form, he continues a headlong course to the bottom of the fell. The man's face had been towards him, and in the staring eyes and open mouth, from which blood was pouring fast, he saw death, death!

How he reached his uncle's house he knew not; faint, dizzy, and covered with blood, he had a confused idea that two men were hard after him. As a matter of fact, he had been pursued for quite half a mile by Billy's companions, now eager to despatch him, and to give them time to quietly leave the country, for a moment's inspection had assured them of their leader's fearful end, and they dreaded the consequence of immediate discovery. Poor Harry! he hastened through the shrubberies, and then leaning against a little iron gate leading through the garden, he paused for a moment to collect himself, and thought of his miraculous preservation. As he passed his hands through his matted and blood-stained hair, the frightful appearance he must present occurred to his mind, and the necessity of gaining his room before any alarm should be given to the house. He therefore bethought him of the easiest by-path that would conduct him most quickly and secretly round, not through the open grounds. With wary eye and anxious breast, he sped along, and on sharply turning a corner, he nearly ran into Maud's arms. There was one dreadful scream; it was heard all over the place. 'My darling, it's nothing, it's nothing,' he cried; 'I'm all right;' but as he advanced, his face turned as into stone; with open eyes, parted and blanched lips, Maud seemed to repel him with her hand, and then, with another piercing and heart-rending shriek, she fell senseless on the ground. At that instant there appeared upon the scene the gardener, a housemaid, Harry's uncle, and the butler. Of course

the housemaid went off into hysterics. They bore poor Maud indoors. In less than an hour she awoke to consciousness, but not to reason. Day after day she would lie and murmur: 'Poor Harry! poor Harry!' Harry, poor fellow, returned that weak to town. His uncle had heard his explanation; in his grief, had pitied, reproached him; had kissed him, and cursed him. But when, on sending a body of servants to the fell, no trace of the dead man was to be found, he broke out into bitter words of grief and invective, hard to be borne. Nothing was to be heard of the three villains at all; the scramble for life must have been an hallucination or an invention of Vernon's own brain, after meeting with an accident which had left such severe marks upon him. Such a man as Billy had, indeed, been noticed in the neighbourhood, and now most of all when dead, he might have been expected to remain for a few hours on the fell, until he was discovered; but he was nowhere to be found. Harry returned to his sympathising but perplexed and distracted father. Billy preceded him to town by three days, accompanied by his allies, without having accomplished much during their poaching expeditions in the country. He bore such a mark upon his visage as made him look more ruffianly than before the adventure, which had caused the breakage of a blood-vessel and temporary insensibility. It is satisfactory to know that he not long afterwards paid the penalty for being concerned in some fresh misdemeanour against the laws of the land in which he lived. A certain deep scar upon his face gave conclusive evidence as to his identity, and he was transported for life. Harry yearned for the good news which never came; Maud continued in the same wretched state. Before the year was out, to crown the misery which preyed upon poor Harry, his uncle died; he had never recovered from the shock of that day, which brought such wretchedness to his house.

In answer to a letter which he at length ventured to his aunt, he was told that Maud was under more careful treatment than his, and that she should prefer to hear no more from a murderer and destroyer. Young Vernon, for a few weeks, gave way to an indescribable melancholy, and it was only through the tender sympathy of his father that he survived. He then devoted himself to hard reading, passed a very creditable examination; and to his men and superior officers alike in India, as a young lieutenant, was only known as the strictest disciplinarian, and the sternest and most uninteresting companion in the mess. The unhappy state of his mind had the usual effect on his health, and hence his return to London, and his appeal to my sympathy and friendship. As a dying man, he requested me, when he was gone, to search out his aunt, and convey to her his last message of forgiveness for the harsh treatment he had experienced at her hands; whilst he assured me that if by his death he could have secured health and happiness to his once bright and merry darling, he would have died long since. And now at length his tale was told. He gazed at me with earnest eyes. I could only press his wasted hand, and promise that I would sacredly carry out his wish. He slept. I watched over him that night. The succeeding day he slept continuously. Towards evening the doctor called. He had seen from the first that he could do little in such a case. He

looked fixedly at his patient as he lay in a sound slumber, felt his pulse, and then, turning to me, said: 'You are Mr Lawrence?'

'Yes,' I replied, 'I am.'

'Ah!' he said, 'I've heard him mention you. You see what your poor friend is suffering from? Well, stay with him as long as you can, please. You've done him pounds worth of good already.'

And what had I done? By being a quiet and sympathetic listener, I had brought that feeling of relief to the poor sufferer which undoubtedly ensues when the burden of sorrow is lightened by being borne on the shoulders of two, instead of being endured by the strength of one alone. Harry and I spent that week quietly enough; he slept, and I read and thought. When awake, he always sought me with an anxious look, which immediately changed to a peaceful smile, when I cheerfully spoke or affectionately pressed his hand; but he never spoke of getting better. When he thought of life, the old wretched look came back; when he thought of the grave, eternal rest seemed all that he desired. My thoughts at last took a definite shape. I explained to Harry that he must allow me a day for business in the country, and that then I would return to him. The next day I took the train for Stonebridge, a small town in Devonshire. Acting upon what I could glean from Harry's uncertain information, strengthened by the *Postal Directory*, I was about to play the last chance. Mrs Vernon had, some time since, sold everything, and left the neighbourhood of Waterthwaite; and now, as I walked through the principal street of Stonebridge, and neared the good lady's supposed residence, I felt as though walking into the lion's mouth.

'Does Mrs Vernon live here?'

'Yes, sir,' answered a very respectable-looking housemaid; 'but she's out for a drive, sir, and won't be back for some time.' I had pulled out my card-case; and seeing me look very much annoyed and perplexed, as indeed I was, she added: 'But if it's anything important, Miss Hamilton is at home, sir.'

'Miss Hamilton!' I exclaimed; 'Miss Maud Hamilton?'

'Yes, sir,' timidly replied the astonished maiden.

I knew not what to think of it; the girl must be an idiot to imagine that I could have any business with the poor imbecile Maud. However, stirred by some inward feeling, perhaps only a wish to see the unfortunate lady, in whom I now felt, on Harry's behalf, so great an interest, I sent up my card, and requested to learn from Miss Hamilton's lips when I might expect the return of Mrs Vernon, as I had important news. This was followed by a request to walk up-stairs into the drawing-room; and in another second, a side-door opened, and a young lady advanced most gracefully into the room. She looked pale and very thin, but if sadness reigned in those beautiful eyes, reason reigned there too. My gaze must have been too earnest, for, with a slight blush and a little confusion of manner, she expressed her regret that Mrs Vernon was out, and feared that she would not be at home for an hour or more. My resolve was taken. 'If you will be so good as to seat yourself,' I said, 'I daresay I can explain the nature of my visit to you quite as well as to Mrs Vernon; I come from an old friend of Mrs Vernon.'

'Oh, indeed ; pray, be seated,' she said.

I had conned over and over what I should say to Mrs Vernon, but I had hardly expected to meet with Miss Hamilton. I began quietly and cautiously ; but I had scarcely spoken a few words, when I saw that she had guessed my errand, had understood that Harry Vernon was the subject of my thoughts. I had a difficult task to perform ; she had turned deadly pale, and clung to the cushions of the sofa on which she was seated for support.

'I feel rather tired with my journey,' I broke in with : 'may I ring for a glass of wine ?' I rang the bell, and the poor girl had sufficient strength of nerve to say : 'Bring in some wine.' I hastily poured out a glass of sherry, which I forced her to take ; and then, as the cat was out of the bag, I quickly concluded all I had to say. I did not tell her how desperately ill and near death's door Harry was ; but her tears flowed freely, and she held out her hand to me, to express the thanks which she could not then utter, as I told her enough to convince her that it depended on herself whether misery or happiness was to ensue from my visit. Of course I had to wait for Mrs Vernon's return, and of course that lady was much surprised to find me at her house, and her daughter in an excited state of mind. The tale was once more and more connectedly told ; and my urgent appeal to humanity's affection and sympathy, added to Maud's tears, had the desired effect. The old lady was softened ; she burst into a flood of tears over her unfortunate nephew, and it ended in my leaving by the last train at night for London, to prepare Harry for their coming up to see him, to forgive him, and to be forgiven. I could hardly contain myself for joy, and any passengers in the compartment of the carriage next to mine must have been rather astonished by my bursts of laughter, my little shouts of self-congratulation, and my snatches of old songs, all the way from Stonebridge up to town. I was never so jolly in my life, and I'm afraid I gave Harry but little preparation. I could not conceal my gladness. 'Well, old man, I've done my business capitally ; I feel quite jovial ;' and I laughed again. 'Where do you think I've been ?' He stared at me with his great hollow eyes, as though he would read my soul. 'I've been to Stonebridge !'

'No, you haven't !' he almost shouted.

'Yes, I have,' I said, smiling ; 'and capital news too.' I then proceeded to tell him my adventures, not exactly at first as they occurred, for I first told him that his aunt was prepared once more to receive him with open arms. At last the great good news of Maud was told. He had two days in which to prepare himself for their arrival. Those two days did wonders, and though he looked like a ghost of his former self, yet he was able to receive them sitting in a chair, beside a cheerful little fire. No one witnessed the meeting between himself and Maud. I had quite enough pleasure in imagining it ; indeed, I could not have controlled myself to see it. It is needless to speak further of my delight, that best happiness of making others happy.

Mrs Vernon had the ultimate and satisfactory pleasure of at last seeing sunshine behind the black clouds which had so long beset her house ; and in her old age she stood with me beside the altar to witness there the union which had once so often been the earnest desire of her heart. Both

Maud and Harry looked older and graver than they might at such a time of life ; but if they were rather aged by early sorrow, they at least knew better how to appreciate every moment in after-life of true love and happiness.

## THE MONTH : SCIENCE AND ARTS.

It is perhaps not widely known that among the numerous scientific societies of this country there is an Anthropological Institute, that is, an association which devotes itself to the study of everything that tends to bring to light the history of mankind. In this Institute are merged two previously existing Societies, the Anthropological and the Ethnological, and the combination is likely to do more for the special object in view than could have been achieved by three separate bodies. Concentration of knowledge and power, including, of course, money power, is as important in science as in war ; and there are other societies, some of them archaeological, which might lay this fact to heart with advantage to all concerned. The Institute accepts facts from all quarters, for Great Britain and Ireland are comprehended in its scheme, illustrations from foreign sources are readily entertained, and the results are published in a *Journal*. For example, we find, in the last number of this publication, particulars of flint implements from various parts of the world—of a neolithic implement from Antrim—of incised flints—of non-historic stone implements from the Mediterranean—on the discovery of stone implements in Egypt—on skulls from Palestine, Tiflis, and Ashantee—on the Beothucs (a native people) of Newfoundland—on Indian remains from Labrador—on the Serpent in primitive metallurgy—on prehistoric and protohistoric comparative philology—on ethnic psychology—on mythological birds ethnologically considered—on school statistics—on the extinction of families—on the development of the mental function in man—and on the mental difference between the sexes. From these instances, the general scope of the Institute may be apprehended ; and as they are published in full, with the discussions for and against, and with lithographs and engravings to make the subject clear, intelligent readers have the opportunity to make themselves acquainted with much that is interesting in the scientific progress of ethnology.

Another association, scientific only in the antiquarian or philological sense, is the Society of Biblical Archaeology. The results of their studies are published in *Transactions*, and in a style which to many readers would be highly interesting. Inscriptions, cuneiform and Egyptian, are translated and discussed ; ancient legends are examined, dates are rectified, and such important subjects are treated of as the Synchronous History of Assyria and Judaea, and the Astronomy and Astrology of the Babylonians.

Dr Mann, in his annual address to the Meteorological Society, told the members that they must make up their minds to allow for the influence of

the sun, in all their meteorological observations. The importance of this remark may be judged of from the fact, that the sun's heat which falls on the earth is sufficient to keep 543,000 million steam-engines of four hundred horse-power, each working continuously. The central heat is such that the most stubborn metallic and rocky substances are fused and reduced to vapours. These vapours blaze; and by aid of the spectroscope, these substances can be identified, and the bright flames can be seen leaping up from the sun to a height of fifty thousand or a hundred thousand miles; thus, henceforth, the spectroscope will have to be used side by side with the thermometer and barometer. If the sun undergoes fluctuations, may we not suppose that the weather of our globe fluctuates more or less in sympathy therewith? To this question many observers now devote themselves, and every year throws a little more light on the problem of the connection between sun-spots and rainfall—as to their effect on heat and light—and on weather phenomena generally. Mr Meldrum, of the observatory, Mauritius, believes that he has discovered that a maximum of cyclones, and a maximum of rainfall, in the Indian Ocean, are coincident with a maximum occurrence of sun-spots. From these few particulars it may be seen that in solar phenomena there is a most promising subject for investigation, even though, as Dr Mann says, 'weather prophets may not be able to read in the sun's face the forecasts of tempests and of benign seasons; yet meteorologists will find there an interpretation of physical secrets that belong properly to their domain, and a field of philosophic generalisation that will add a power and dignity to their own grasp of their special methods of intellectual research.'

At Kromsminster, in Bavaria, weather observations have been made for more than a century. Discussion of these observations, and of other observations made in Saxony, leads to the conclusion that there is a periodicity in thunder-storms as well as in some other natural phenomena. Von Bezold says, in his paper on the subject, that in years when the temperature is high, and the sun's surface relatively free from spots, thunder-storms are abundant. Since, moreover, the maxima of the sun-spots coincide with the greatest intensity of auroral displays, it follows that both groups of phenomena, thunder-storms and auroras, to a certain extent supplement each other, so that years of frequent storms correspond to those auroras, and *vice versa*. It is pointed out that this 'connection between sun-spots and storms does not by any means sanction the supposition of a direct electrical interaction between the earth and sun, but may be simply a consequence of a degree of insolation dependent on the sun-spots.' The changes of insolation manifest themselves successively in different latitudes, and not contemporaneously.

Mention has been made in former columns of this *Journal* of the connection between fluctuations of the barometer, and storms, and the occurrence of explosions in coal-mines. The observations made, establish the fact that explosions follow a change of pressure and a change of temperature; and in the new Coal-mines Regulation Act it is now required that, 'after dangerous gas has been found in any mine, a barometer and thermometer shall be placed above ground, in a conspicuous position, near the entrance to the mine.' Of

course, the intention is that the instruments shall be watched, and precautionary measures taken in accordance with their indications. It is remarkable that explosions are fewest when the wind blows from the north.

A nautical contemporary points out that there is an 'analogy between the causes of explosions in coal-mines and the causes of the principal casualties to shipping;' and the conclusion is that observation of the barometer and thermometer may be as beneficial in one case as in the other. Much has already been done towards making the value and importance of these instruments known among our seafaring population, but much remains to be done, and the more widely the knowledge is spread the better.

In the last part of the *Journal* of the Royal Agricultural Society is an instructive paper by Mr Lawes on the valuation of unexhausted manures. If a tenant gives up a farm before the effect is exhausted of the fertilisers which he has put into the soil, it seems but reasonable that he should be compensated for that reserve of effect. But the question is a difficult one, for the nature of the manure, the nature of the soil, the method of farming, and other particulars, have to be taken into account. As Mr Lawes explains, 'wheat has been grown, without manure, and by different descriptions of manure, in the same field, for thirty-one years in succession, and with very similar results. Mineral manures alone have given very little increase of produce; nitrogenous manures alone, in the form of ammonia salts or nitrate of soda, have given considerably more produce than mineral manure alone; and the mixture of mineral and nitrogenous manures has yielded much more still, and more, of both corn and straw, than the annual application of farm-yard manure.' The most valuable manures are thus those which contribute most nitrogen to the soil and the crops.

The conclusions with which Mr Lawes ends his paper are, that, 'in the existing state of our knowledge, no simple rules, applicable to various soils and subsoils, climates, seasons, crops, and manures, can be laid down for the valuation of the unexhausted residue of previously applied manures which have already yielded a crop.' In the numerous discussions on this subject, it never seems to have occurred to any one that the simplest of all rules is to make everything a matter of contract between landlord and tenant. What more could any one have?

The result of Mr Lawes' experiments and other experiments recorded in the Society's *Journal*, which does not surprise us, is to demonstrate in the clearest possible manner, that grain crops may be grown year after year without injury to the soil, provided that the land be properly tilled, and that the right kinds of manure are made use of.

From time to time facts are discovered which add to the existing evidence that there is a rise of the land going on in the southern circumpolar regions: in Australia, Tasmania, and New Zealand, the phenomena are remarkable. Owing to the rise of the land in one place, certain lakes and a river disappeared. The natives, who had sold the land, squatted immediately on the places that had been occupied by the water, contending that they had never sold the lakes. In another place,

on the western coast of New Zealand, the high-water mark of the year 1814 is now two hundred yards inland, and many other facts might be cited. They prove, as Mr Howorth says, in a communication to the Royal Geographical Society, that the masses of land round about the south pole 'are at present areas of upheaval,' and that 'the earth's periphery is being stretched or extended in the direction of its shortest axis.' He draws attention to the 'very remarkable fact, that in all this area, exhibiting so many signs of rapid upheaval, there should be such a marked absence of volcanoes,' for the two or three in the north island of New Zealand, those in Tierra del Fuego, and Mount Erebus, are but few in so vast a circle. 'If,' says Mr Howorth, 'if volcanoes be the violent efforts of the eruptive forces of the earth, it is remarkable that they should be absent, or only present in such feeble examples in this area, and that we shall search such markedly rising areas as Australia, Tasmania, and South Africa in vain for them. My explanation,' he adds, 'of this absence, which involves some very heterodox views on the subject of volcanic energy, I must reserve for a future occasion.'

*On Iron as a Constructive Material*, is the title of a paper read before the Institute of British Architects by Mr Driver, who contends that false notions prevail with respect to the use of iron in building. One of these false notions is, that iron should be disguised, covered with lath and plaster, to make it fit for architectural purposes; which implies that iron itself is too intractable a material either for feature or ornament. As a case in point, Mr Driver takes the ordinary shop front, where a sheet of plate-glass and a wooden fascia appear to support the weight of three or four stories of brick or stone. The weight is in reality supported by an iron girder behind the fascia; and it is clear that the girder might be brought forward, and so constructed with panels and mouldings, that it would be sufficiently ornamental, and at the same time have the appearance of strength essential to proper architectural effect.

It is a prime condition of the use of iron in architecture that it should look like iron. Imitations are too much the fashion of the day. Iron, by reason of its strength, is susceptible of constructive effects alike new and beautiful; notwithstanding that so many distressingly ugly railway bridges and railway stations favour the impression that iron and ugliness always go together. Readers interested in the subject should get Mr Driver's paper as published by the Institute, and study his designs for pillars, bases, capitals, ribs, ties, brackets, for the heads even of bolts and rivets; they would then become aware of the great adaptability of iron as iron to the art of building and of architecture.

At a recent meeting of the same Institute it was mentioned that the glazed tiles made at the Doulton Works, Lambeth, will resist the destructive atmosphere of London. Architects and builders are unfortunately too well aware that ordinary glazed tiles crack or flake off after exposure to the weather, and have often longed for some of those indestructible materials with which the architects of the middle ages appear to have been well acquainted. What an advantage it would be if tiles of imperishable glaze could be produced! The surfaces of buildings might be

coated therewith; all the moulded and ornamental parts might be made of the same material; dust and soot would not lodge, or would be quickly washed off by the rain, and the beauty of the architecture would be displayed through long generations. The Lambeth Works have won a well-deserved reputation by shewing that pottery and modelling may be developed into exquisite forms of art; and if glazed tiles that never alter can be produced, there will be a further claim to distinction.

The heavy mineral baryta is now used largely in the arts: white lead or paint is adulterated with it to the extent of twenty-five or thirty per cent.; chlorate (which produces a green flame) and nitrate of baryta are employed as ingredients in fireworks; in the form of sulphate it makes a beautiful white coating for collars and cuffs and other articles of dress, and for cards. This permanent white, as it is called, is manufactured to the extent of five thousand tons a year. Carbonate of baryta is a strong poison, and is much used for killing rats. In France, the beet-sugar manufacturers use caustic baryta in sugar-refining; and a preparation of baryta is used by chemists in the production of peroxide of hydrogen, which is a valuable article in bleaching operations, in changing the colour of dark hair to light, and as a medical reagent.

Thirty years ago the digging of iron in Cleveland, north-east Yorkshire, was a very small affair. Last year (with deduction of a strike of two weeks) the quantity of ironstone raised in the same district was 5,435,233 tons; not without risk, for twenty-five miners were killed by accidents. We have it on the authority of the Iron and Steel Institute that the Cleveland 'output' was nearly one half of the whole production of iron ore in England and Wales in 1874.

In Mr Selwyn's Report on the Geological Survey of Canada, information is given of coal deposits in Canada, that is, in the Saskatchewan region. The coal is described as 'hard and bright, and jet-like,' in horizontal beds; and the area of the coal-field is stated as 25,000 square miles. We learn too that good coal has been discovered in Patagonia, at a point in the Strait of Magellan, where it is being worked under a concession from the Chilean government.

Professor Le Conte, of the University of California, has recently described what he calls 'the most extraordinary lava-flood in the world.' In Middle California, he says, it appears as separate streams; but in Northern California, in Oregon and Washington, it becomes 'an absolutely universal flood, beneath which the whole original face of the country, with its hills and dales, mountains and valleys, lies buried several thousand feet.' This great outpour of eruptive rocks extends from Nevada and Montana to British Columbia, and covers an area of from 200,000 to 300,000 square miles. Professor Le Conte is of opinion that it was all produced by volcanic eruptions in the Cascade Mountains. From this we learn that the more Western America is explored, the more does the magnitude of its natural phenomena become apparent.

The *New York Medical Journal* states that, in the Mount Sinai Hospital in that city, acute rheumatism is treated and cured by applications of cold. The method, we are informed, 'consists in

the use of cold baths, combined with icebags, to the inflamed joints. Every patient does not bear well the cold baths; but the icebags always prove grateful, and always remove the pain. The very curious point has been noticed, that if blankets are placed over the patient, or if in any way sweating is promoted, the cold loses its efficacy. It is found also that if the icebags are removed from the inflamed joints, the pain sometimes reappears, and when it does, a return to the icebags again relieves the patient.

In Paris, carriagee, or Irish moss, has been used as a substitute for linseed meal and other kinds of poultices, with good results. It does not ferment, and remains moist and inodorous for sixteen or eighteen hours when properly prepared by chopping and soaking.

Professor Dewar, in the conclusion of a lecture on the physiological action of light, delivered at the Royal Institution, remarked that 'it is possible, by experiment, to discover the physical expression of what is usually called in physiological language fatigue.'

How greatly would the prosperity and happiness of nations be increased, if quarrels could be adjusted by arbitration instead of the sword.

The Peace Society's Annual Report, just issued, shews that the active propagation of its principles, both at home and abroad, under the leadership of Mr Henry Richard, M.P., continues to be attended by an amount of success which must be very encouraging to its friends. Notwithstanding the recent disturbing war rumours, which are happily subsiding, it is clear, from the declarations which have come from various Continental States, that there is nothing which the peoples of Europe desire so much as peace. The Society's Report shews that the example set by the British House of Commons, in July 1873, in adopting Mr Richard's Motion on Arbitration, has been followed, during the past year, by the Legislatures of the United States (both the Congress and the House of Representatives), Belgium (the Upper and Lower Chambers), and Holland, all of which have adopted similar motions. The Canadian parliament has, this year, favourably entertained a resolution in support of international arbitration, although it was not pressed to a division. The subject is also about to be brought before the attention of the Danish legislature, on a proposal submitted to that body by three of its members. Several striking practical illustrations of the growing prevalence of pacific diplomacy as a substitute for war, have been afforded during the year. One was the case of China and Japan, which nations, when on the very point of hostilities, consented to accept the arbitration of the English ambassador at Peking, in November last, by whose award the threatened war was entirely averted. A dispute as to frontier territory, between Italy and Switzerland, has been amicably arranged this year, by the arbitral decision of the United States ambassador, at Rome; whilst the dispute between the British and Portuguese governments on the question of Delagoa Bay, is, while we write, under the arbitration of Marshal MacMahon, President of the French Republic. And at New York a New Court for Commercial Arbitration has been established, with the prospect of important good results.

The Report also refers with satisfaction to the growing interest taken in the Conferences for the

Reform and Codification of International Law, which have been annually convened in Belgium, Switzerland, or elsewhere, for several years past. The Society has continued its diligent use of the platform and the press. Amongst its special supporters, its *Herald of Peace* circulates monthly, forming a valued channel of intercommunication and information. By means of the Society's agents, about three hundred and twenty lectures and meetings have been held within the twelve-month. The Report further acknowledges the valuable foreign co-operation which the English Peace Society receives from kindred organisations and fellow-labourers in the United States, France, Holland, Belgium, Italy, and Switzerland.

We wish for the Society God-speed in its beneficent work.

#### GOING OUT WITH THE TIDE.

RAISE me up in my bed, wife;

There's the sound of the sea in my ear;

And it sings to my soul in a music

That earth is not blessed to hear.

Open the little window, wife,

Then come and sit by my side;

We'll wait God's sweet flood-water

To take me out with the tide.

I see the harbour-bar, wife,

And my dear little boat in the bay;

But who shall be able to guide her

When her master hath passed away?

I know that her helm, so trustily,

Will answer no other hand

As it answered mine, when I knew, wife,

You were waiting for me on the strand.

Our boys are all before us, wife;

Wee Jack is beneath the wave,

And blue-eyed Freddie sleeps, wife,

In yonder yew-bowered grave,

Where the early daisies cluster

Around his baby bed,

And the thrush sits chanting softer

In yon tree that shades the dead.

There's a chill runs through our hearts, wife,

When the harbour-bar doth moan;

But a darker grief will be yours, wife,

When you're left in the cot alone;

But a few more flows of the sea, wife,

And a few more ebbs of the tide,

Then God's sweet flood shall bring you

Again to your old man's side!

The red sun is low in the west, wife,

And the tide sinks down with the sun;

We will part with each other in love, wife,

For sweetly our lives have run.

Give me your hand, my own love,

As you gave it in days of yore;

We will clasp them, ne'er to be sundered,

When we meet on the far-off shore!

PRICE 1½d.

## SOME EARLY RECOLLECTIONS.

### THIRD PAPER.

MEMORY carries me pleasingly back to a particular Sunday evening in the summer of 1810. I had been at the parish church twice during the day, with my father and mother, and brother Robert. In the forenoon 'diet of worship,' as it was called, R. and I, to our shame be it said, instead of attending minutely to Dr Lee's scholarly discourse, slyly occupied ourselves in scratching with a pin the initials of our names on the book-desk. At the afternoon 'diet,' what with the effects of 'kail' for dinner between one and two o'clock, and the intense smell of sprigs of peppermint and southernwood, which the lads and lasses brought with them to the kirk—and perhaps also from the want of ventilation—it was barely possible to keep awake; the somniferous tendency being powerfully aided by the delightful hum of the preacher's eloquence. About two-thirds of the congregation, accordingly, took their nap, notwithstanding the snuff-boxes, which were covertly handed about. Poor R. was at this time a fair-haired boy of eight years of age, and I was two years older. Our age, perhaps, offered some excuse for a marked degree of irreverence: with our heads leaning on the bench before us, we fell sound asleep.

Having gone through the day in a perfectly constitutional manner, the inhabitants of the town felt that, towards evening, they might, in a mild and quiet way, indulge in a little recreation—not amusement by any means, only a smell of the fresh air. All depended on slowness and quietness. Anything like laughing, whistling, singing, walking hurriedly, or boisterous behaviour, was proscribed. You might do almost what you liked, provided it was done slowly and quietly, as if you were not doing it. The sin consisted in making a noise. A particularly industrious shoemaker in the town, in closing his week's labours on Saturday night, did not mind working an hour or two into Sunday morning, but always

quietly. Addressing his son, he would say: 'Get a' your chappin' ower before twal'; signifying that he must not on any account make a noise hammering his leather after twelve o'clock, but confine himself to the silent occupation of sewing—as if in that there could be nothing wrong.

On Sunday evenings, from the proceedings of the day, everything was agreeably calmed down to an unchallengeable quietude. People who had gardens walked out quietly—if by back-doors so much the better—and with their hands in their pockets quietly made their observations on the growth of the cabbages and gooseberries. Others quietly took a sauntering sort of walk to the river, and in a manner not to provoke discussion, spoke of the prospects of fishing for the season; perhaps introducing a somewhat playful anecdote about catching a salmon, but always in a subdued tone of voice, and never venturing beyond a smile. Some took a fancy for going a little more afield, and leaning over gateways, quietly made remarks on the crops, and threw out speculations as to the probable price of meal and potatoes after next harvest. A number, otherwise bent, took a fancy for visiting the churchyard, where an hour was quietly and pleasantly spent in making observations on 'the poor inhabitant below,' in the respective newly made graves. To all this there may be fault-finders. As long as human nature is what it is, I can imagine nothing more decorous or reverential than these modest and leisurely Sunday evening musings.

My father had no garden to speak of. His tastes did not lie in that direction. At all odd hours he fastened on books and devoured them. He was a diligent reader of the *Edinburgh Review*, by which, like others in remote places, he kept ahead on subjects of general importance. The *Quarterly*, which he would have equally devoured, had not yet appeared in the place. The only newspaper of which I have any familiar remembrance at this early period, was *The Edinburgh Star*. It was a twice-a-week journal, and, as things went, had a good circulation. My father could not afford to subscribe for *The Star*. All he could do was to be

a member of a club to take in the paper, which was handed about to one after the other, each member being allowed to have it in turn for a certain number of hours. Such, in the days of taxed and dear newspapers, was an almost universal practice, and in our community it was no way singular.

By some chance, which I am unable to explain, my father's tenure of the Friday's *Star* began on Sunday evening, at six o'clock, when the natives generally were out on their quietly sauntering perambulations. For three days he had heard nothing satisfactory of the war, and in his anxiety had watched the face of the alabaster timepiece on the wall of our little parlour, to see when the paper could with propriety be sent for. The hands on the dial having at length pointed to a quarter to six, I am requested to go for *The Star*. At the time, I am seated at a window trying to commit to memory that Scripture paraphrase of matchless beauty, which my mother prescribed to me as a study:

Few are thy days, and full of woe,  
O man, of woman born—

Laying the book aside, I obey the command to go for *The Star*, and, on the whole, being glad to get into the open air, I hurry off with a leather cap on my head, and a crisply plaited frill down my back in as good preservation as snoozing at church had permitted. I knew all about the mission, for it was not the first time I had been so employed.

The person to whom I was sent was a respectable candlemaker—his surname of no consequence. He was a short, stoutish man, who filled the office of Dean of Guild, which contributed to give him a certain dignified position in the town. Ordinarily, however, he was best known as 'Candle Andrew.' As a bachelor, though advanced in life, Andrew lived with his sister, who acted as housekeeper and shopwoman, and was usually called 'Candle Nell.' It was altogether a successful arrangement. The brother and sister made no sort of show. The business was conducted quietly and cheaply. In the front was the shop, in looking into which, over a half-door, you saw square bins full of candles of various dimensions and qualities, from penny dips up to moulds and long sixes. Candle Nell did not wait in the shop for customers. That would have been a downright waste of time. In the pauses of business, she occupied herself in a side-room, or in the kitchen behind, and only came out of her den when summoned by a bell, the string of which was a piece of whipcord, to which was attached an old key by way of handle. I have had the honour of pulling the key, and buying from Nell a pound of long sixes.

On the present occasion, being Sunday, the shop was shut, and entrance to the premises was by a side-door, the first on the right-hand in going down the close as you went to the candle-work. To that door I proceeded. It was opened by Nell, and I was ushered into the kitchen until she announced the object of my visit. All was quiet

and decorous. I was invited to step into the room. Here sat Candle Andrew in his Sunday's best, with an under red-silk waistcoat, and his bald head lightly powdered. Before him lay a large open folio volume of Matthew Henry's Bible, covering nearly the whole table. Above it, and just about the same size, lay *The Star*. This was a peculiarly convenient arrangement; for Matthew Henry could be made uppermost or undermost according to the character of the visitor. The shift could be effected at a moment's notice. It being only 'Willie for the paper,' all was right. Matthew Henry was undermost. Candle Andrew, whom I esteemed to be a great man, as Dean of Guild, with his powdered head and red under waistcoat, was so kind as speak to me, and what he said (while folding up the newspaper) was momentous. 'Great news, Willie, my man—terrible battles in Spain—thousands o' French prisoners—a number o' them brought to Leith wi the *Thetis* frigate, and I wadna wonder if some were sent here. However, there's *The Star*; and please to give my compliments to your mother.' Little did I think that what Candle Andrew had hinted at was destined to shape the whole existence of my brother and myself, indeed the whole family, father and mother included.

Inspired by the notion that there was something important in the intelligence, I hastened home at perhaps too high a rate of speed to be quite legitimate on Sunday evening. Before I arrived, my father had received a glimmering of the news. A neighbour had called to say that there was to be immediately a great accession to the present French prisoners of war on parole. As many as a hundred and eleven were already on their way to the town, and might be expected in perhaps a day or two.

There was speedily a vast sensation in the place. The 'locals' had just been disbanded. Lodgings of all sorts were vacant. The new arrivals would on all hands be heartily welcomed. On Tuesday, the expected French prisoners in an unceremonious way began to drop in. As one of several boys, I went out to meet these new prisoners of war on the road from Edinburgh. They came walking in twos and threes—a few of them lame. Their appearance was startling, for they were in military garb, in which they had been captured in Spain. Some were in light blue hussar dresses, braided, with marks of sabre-wounds. Others were in dark-blue uniform. Several wore large cocked-hats, but the greater number had undress caps. All had a gentlemanly air, notwithstanding their generally dishevelled attire, their soiled boots, and their visible marks of fatigue. They were accompanied by no guide, but had seemingly been told to find their way to their destination as they best might. Before night, they had all arrived; and through the activity of the agent appointed by the Transport Board, they had been provided with lodgings suitable to their slender allowance.

This large batch of prisoners on parole were, of course, all in the rank of naval or military officers. Some had been pretty high in the service, and seen a good deal of fighting. Several were doctors, or, as they called themselves, *officiers de santé*. Among the whole there were, I think, about a dozen midshipmen. A strange thing was their varied nationality. Though spoken of as French, there was in the party a mixture of Italians, Swiss, and Poles; but this we found out only after some intercourse. Whatever their origin, they were warm adherents of Napoleon, whose glory at this time was at its height. Though not greatly fraternising with the prisoners of war who had been already in the town, they were benefited by their experience, and the knowledge they had acquired of the language. Receiving friendly hints from these previous residents, they settled down in a wonderfully composed manner. Obviously, the new-comers were a distinct class from the older set. They were lively, with minds full of the recent struggles in the Peninsula. Expressively, they spoke of the treachery they had experienced in Spain, where, as prisoners of war, they were constantly exposed to the assassination of those who affected for them the greatest friendship. I recollect one of them saying that every Spanish lady carried a dagger, which she would not scruple to use. Perhaps the atrocities committed by the French troops in Spain might have been pleaded in extenuation of this general reproach on the country. Now, matters were very different, for which these strangers appeared thankful. Drifted by the fortune of war into a small and hospitable Scottish town, they felt themselves in a haven of rest.

It was a material assuagement of their condition to find that the keeper of the principal hotel was almost a countryman. He was a Belgian, spoke French, and was in many ways useful to them. One thing disconcerted them. There was no billiard-table in the town; and, Frenchmen generally, without the solace of billiards, are in a hapless condition. The privation was got over by the spirited enterprise of a grocer, who believed he might turn the penny by getting up a billiard-table. It was a bold and rather costly venture, and I am far from certain that it answered commercially. The billiard-table was procured, and set up in a small building near the Tweed, and it became the daily rendezvous of the Frenchmen during the whole time of their stay.

People may amuse themselves playing at billiards, but the recreation cannot exactly be called a means of livelihood. How did these unfortunate exiles contrive to live—how did they manage to feed and clothe themselves, and pay for lodgings? Thereby hangs a tale, which we will by-and-by come to. The allowance from government was on a moderate scale. I doubt if it was more than a shilling a head per diem. In various instances two persons lived in a single room, but even that cost at least half-a-crown a week, which made a considerable inroad on revenue. The truth is, they must have been half-starved, but for the fortunate circumstance of a number of them having brought money—foreign gold pieces—concealed about their person, which stores were supplemented by remittances from France; and in a friendly way, at least as regards the daily mess, or *table-d'hôte*, the richer helped the poorer, which was a good trait in their

character. The messing together was the grand resource, and took place in a house hired for the purpose, in which the cookery was conducted under the auspices of M. Lavoche, one of the prisoners, who, as is not unusual with Frenchmen, was skilled in cuisine. My brother and I had some dealings with Lavoche. We cultivated rabbits in a hutch built by ourselves in a back-yard, and sold them for the Frenchmen's mess; the money got for them, usually eightpence a pair, being employed in the purchase of books.

Billiards were indispensable, but something more was wanted. Without a theatre, life was felt to be unendurable. But how was a theatre to be secured? There was nothing of the kind in the place. The more eager of the prisoners managed to get out of the difficulty. There was an old and disused ballroom. It was rather of confined dimensions, and low in the roof, with a gallery at one end, over the entrance, for the musicians. In the days of yore, however, what scenes of gaiety had it not witnessed! Walter Scott's mother, when a girl, I was told, had crossed a dangerously high hill in a chaise from the adjacent county, to dance for a night in that little old ballroom. Now set aside as unfashionable, the room was at anybody's service, and came quite handily to the Frenchmen. They fitted it with a stage at the inner end, and cross-benches to accommodate a hundred and twenty persons, independently of perhaps twenty more in the fiddlers' gallery. The thing was neatly got up, with scenery painted by M. Walther and M. Ragulski, the latter a young Pole with artistic tastes. No license was required for the theatre, for it was altogether a private undertaking. Money was not taken at the door, and no tickets were sold. Admission was gained by complimentary billets, distributed chiefly among persons with whom the actors had established an intimacy.

Among these favoured individuals was my father, who, carrying on a mercantile concern, occupied a prominent position. He felt a degree of compassion for these foreigners, constrained to live in exile, and besides welcoming them to his house, gave them credit in articles of drapery of which they stood in need; and through which circumstance they soon assumed an improved appearance in costume. Introduced to the family circle, their society was agreeable and in a sense instructive. Though with imperfect speech, a sort of half-French, half-English, they related interesting circumstances in their career. R. and I, desperately keen to learn, but with poor opportunities of doing so, listened with greedy ears to the discourse of the Frenchmen, which had the double advantage of increasing our stock of facts and improving us in the knowledge of the French tongue.

How performances in French should have had any general attraction may seem to require explanation. There had grown up in the town, among young persons especially, a knowledge of familiar French phrases; so that what was said, accompanied with appropriate gestures, was pretty well guessed at. But, as greatly contributing to remove difficulties, a worthy man of an obliging turn, and genial humour, volunteered to act as interpreter. Moving in humble circumstances as a hand-loom weaver, he had let lodgings to the French captain and his wife, with the black boy,

and from being for years in domestic intercourse with them, he became well acquainted with their language. William Hunter—for such was his name—besides being of ready wit, partook of a lively musical genius. I have heard him sing *Malbrouk s'en va-t-en guerre*, with amazing correctness and vivacity. His services at the theatre were therefore of value to the natives in attendance. Seated conspicuously at the centre of what we may call the pit, eyes were turned to him inquiringly when anything particularly funny was said that needed explanation, and, for general use, he whisperingly communicated the requisite interpretation. The actors, of course, looked upon him as a valuable appendage to the establishment.

At the small French theatre, so extemporised, my brother and I had the pleasure of seeing performed some of the favourite comedies of Molière, and other dramatists. The actors did not attempt the lofty tragedies of Corneille, nor pieces in which there is a host of characters. They confined themselves chiefly to what was comic, and requiring at most half-a-dozen performers. A favourite with them was a piece by a French dramatic writer now little heard of, in which there appears a buffoon called Jocrisse, whose performances always raised shouts of laughter. The actors had a difficulty as regards the female characters, which was only got over by dressing up two or three of the more effeminate-looking as actresses. One of these was M. Avril, who acted the part of young heroines. By means of attire borrowed from my mother, and a proper amount of padding and painting, he made a fair appearance in the character of Lucinde in *Le Médecin Malgré Lui* (The Physician in Spite of Himself), by Molière. In this grotesque piece, the character of Sganarelle, who acts the sham physician, was well represented by one of the taller and more robust of the prisoners, M. Lestange. Geronste, the father of Lucinde, who pretends to be deaf and dumb, was played by Gotto. I remember the laughter which burst from the French part of the audience when Sganarelle imposes on Geronste by that famous passage as to the situation of the liver and the heart. At one time, he said, the liver used to be on the right, and the heart on the left side, '*Mais nous avons changé tout cela.*' The natives present who were unacquainted with the language, appealed to Hunter. 'What's that—What's that he says, Will?' 'He says it used to be the fashion to have the liver on the right, and the heart on the left side, but that the doctors have changed all that now!' So put up to the joke, the natives heartily joined in the laugh, though rather tardily. Dear old William Hunter, with his ready dexterity in illustrations of Scottish humour, how my brother and I in later years regretted his loss! As for the French plays, which were performed with perfect propriety, they were to us not only amusing but educational. Life, to be worth anything, is made up of happy recollections. The remembrance of these dramatic efforts of the French prisoners of war has been through life a continual treat. It is curious for me to look back on the performance of pieces of Molière, in circumstances so very remarkable.

Ragulski, the clever scene-painter, who executed charming sketches in water-colours, was fated not to finish as a prisoner of war on parole. He was one of the few midshipmen, all of whom were

suddenly ordered to lose their parole, and to be confined with the common class of prisoners in the depot at Penicwick. To subject a number of persons in the rank of gentlemen to this cruel indignity may seem to be almost incomprehensible. In that rancorous war, however, the British government, with all its noted generosity of character, felt constrained to lay aside common principles of action. The alleged cause for the extraordinary procedure was that Napoleon had withdrawn the privilege of parole from English midshipmen held as prisoners by the French, and that this severity took place by way of reprisals. However that might be, the blow fell heavily on Ragulski, and a number of others; all of whom received orders to assemble at the market cross at six o'clock on a certain morning. In obeying the peremptory summons, poor Ragulski called in passing, with a wallet on his back, to bid farewell to my father and mother. It was a melancholy parting scene. I accompanied him down the street to the cross. Here, several of those prisoners who were not ordered off, attended the departure of their less fortunate companions. One of these sympathising friends was Captain Durisi, who, I observed, had some confidential talk with Ragulski at parting. There was much shaking of hands, and kissing on the cheeks. A company of soldiers that had been sent for the purpose, with fixed bayonets, environed the party; and all were marched off. I saw them no more, but have reason to believe that Ragulski contrived to escape from the prison—a step he probably considered to be no way dishonourable, seeing that he was now bound by no parole.

There was a hue of romance in the affair. A lady in reduced circumstances in the town, with two daughters, who were dressmakers, had let lodgings to Captain Durisi. Between Emily, one of the daughters, and the young Frenchman, there sprang up a fervent attachment, and through her connivance, as it was always understood, Ragulski and another escaped prisoner found a refuge for a time at that conveniently obscure retreat, the Clay House. There they remained, until they succeeded in getting out of the country. It is pleasant to know that Emily was not unrequited for her obliging succour to the friends of her admirer. She in due time, when circumstances were a little more propitious, became Madame Durisi, and for years afterwards gracefully figured among the fashionable society of Paris. Lately, in passing down a by-street in the little town, I glanced at the window of a modest dwelling at which I recollect having seen Emily industriously pursuing her work as a seamstress, and thought of her strange transition thence to a brilliant salon in the Rue de Bac.

It might not have been a great sacrifice for Ragulski to have suffered confinement; for, as it happened, it would only have been for a short period. Moved, perhaps, by a relaxation in the severe measures of Napoleon, the British government released the French midshipmen whom they had imprisoned, and stationed them at various places on parole. Not foreseeing this act of clemency, Ragulski and another prisoner, as just mentioned, made their escape. At the close of the war in 1814, all the French prisoners of war whatsoever were set free to go where they pleased; those at Penicwick being sent home in shiploads from Leith.

Previous to this event, at the beginning of 1812, the party of prisoners on parole, of whom I have been recalling fragmentary remembrances, were ordered to depart to a town in a south-western county. The order sent a shiver through the community. The Frenchmen were generally liked. Those among them who were doctors, or *officiers de santé*, had often lent their aid in medical consultations with local practitioners. Above all, a number of the *détenus* were in debt to the townspeople, who, by their abrupt removal, foresaw an irretrievable and ruinous loss. To some of the original prisoners who had come to the place as early as from 1803 to 1806, the order conveyed no comfort. They had, as it were, become naturalised, and did not wish to go away. Monsieur Boutelle was inconsolable. All his relations in France were dead, and he looked forward to closing his days in this the place of his exile, and to being buried in a green spot in the churchyard known as the 'Strangers' Nook.' It was hard for him, at his advanced age, to migrate to a new and unknown scene, leaving friends behind him. What should he do to demonstrate the depth of his emotions? There was an interval of a week for preparation for the journey. During that time, he daily and most assiduously gathered fir cones in a neighbouring plantation, and brought them home as fire-lighters in pocketsful to his old and infirm landlady. In his poverty, they were all he could offer her in acknowledgment for years of friendly attentions.

No vehicles were provided for the transit of the prisoners to their place of destination, sixty miles distant. They might find their way thither the best way they could. At his departure from the narrow close, where for eight years he had tranquilly passed his existence, Boutelle was a sight to move any one. With his thin legs protected by black gaiters, the little bit of queue peeping over the collar of his brown great-coat, a bundle in one hand, and a stick in the other, he seemed to be ill fitted to undertake a journey, which could not be effected, even with occasional rides in a cart, in less than three or four days. I escorted him for a couple of miles on his route, relieving him for that distance of the weight of his bundle. At parting, the warm shake of the hand, and the courteous bow of the aged gentleman, can as little be forgotten as his last words: '*Dieu vous bénisse!*'

The departure of the prisoners of war on parole was the signal of my father's doom. He struggled on awhile, but it was useless. In his credulity, he had given the Frenchmen credit far beyond what was discreet or reasonable; for in their peculiar position they were in no respect legally amenable to ordinary obligations. They left a profusion of promises, but these came to nought. My own conviction is, that a number of them perished at Waterloo. At anyrate, they were no more heard of. Now that they were gone, arose agonising considerations. Ruin, dark pitiless ruin, impended over my father and his family. No hand was held out to save. None offered a word of sympathising compassion. Then came the storm which swept everything away. Yet, was not this fierce hurricane of commercial ruin and domestic anguish a beneficent act of Providence? Out of the disaster caused by an imprudent confidence in these exiled Frenchmen came, in good time, something to excite a high sense of gratitude. Driven, with his chil-

dren, to seek fortune elsewhere, my father brought them to Edinburgh, and there, after a long course of years, one of them lingeringly remains to record these imperfect Early Recollections. w. c.

### ABOUT CROWNS.

THERE were times when his crown was the indispensable companion of every king. Not that he always wore it, like the monarchs of melodrama, but it was his personal property, always kept within easy reach. He carried it with him on his journeys; when he rode at the head of his feudal chivalry on the battle-field, a jewelled coronet on his helmet took its place; he wore it at his court; it was the one great mark of his royal dignity by which men could feel he was a king. It would seem that some of these old sovereigns slept with the crown upon a table beside their beds; there is, however, no reason to suppose that they actually wore it during the hours of repose, though they are often represented as doing so by the illuminators of mediæval manuscripts. Of course, this is only a conventional sign indicating that the sleeper is a king, for assuredly the head would lie very uneasily that wore a crown for a night-cap.

The oldest of the crowns of Europe is the Iron Crown of Lombardy, now restored to its resting-place of centuries in the cathedral of Monza, the sunny little town, which, from the Alpine slopes, looks down upon imperial Milan, whither many a time its treasure was borne to be placed on the brow of a German Kaiser at his second coronation. His first was at Aachen, by the tomb of Charlemagne, where he received the silver crown of Germany; his second at Milan; his third at Rome, where the pope conferred on him the golden crown of the Empire. But the Iron Crown was the most venerable of all. For thirteen hundred years the Iron Crown has held the foremost place amongst the diadems of Europe, for it was formed by the skilful hands of Roman goldsmiths in the sixth century, and sent by Pope Gregory the Great to the Gothic Queen Theodolinda, when she had freed Lombardy from the Arian heresy. Its form is simple, as one might expect from its ancient date. It is a broad flat ring or diadem of gold, adorned with enamelled flowers and precious stones; stones not cut into facets, as in modern jewellery, but emeralds, sapphires, and rubies in their rough uncut form as they came from the mine. But inside this circle of gold and jewels is a thin band of iron, from which the crown takes its name, and this iron, tradition asserts, is one of the nails of the true cross hammered out into a ring. Long and angry have been the battles fought by antiquaries on this point. Those who deny its authenticity, headed by Muratori, certainly bring weighty arguments to the support of their view; but the tradition has survived all their learned folios, gallant champions have fought pen in hand in its defence, and still, in the language of the people the crown of Monza is called *il sacro chiodo*, 'the holy nail.' It graced the imperial front of Charlemagne and a long succession of German emperors, ending with Charles V. But the last sovereign who wore it was Napoleon I. In May 1805, he assembled at Milan the dignitaries of the Empire, the representatives of his royal and imperial allies, and a splendid

circle of marshals and generals, and in their presence he placed it on his head, repeating the proud motto of the Iron Crown: 'God has given it to me; woe to him who touches it!' In 1859 the Austrians, retreating from Lombardy, took the Iron Crown with them to Mantua, and subsequently to Vienna. There it remained until, by the treaty which ceded Venetia to Italy in 1866, it was restored to its old home in the sacristy of the cathedral at Monza, and there it rests to-day amid the other treasures of Theodolinda—her jewelled comb, her golden hen and seven chickens (the symbols of Lombardy and its seven provinces), and the crown of her husband Agilulph.

Next in age to the Iron Crown, but far exceeding it in value and beauty of workmanship, are the crowns of the old Gothic kings of Spain, discovered seventeen years ago near Toledo. They were found in some excavations which were made in an ancient cemetery at Fuente di Guerrazar, two leagues from that city. They are eight in number, and their intrinsic value is estimated at two thousand pounds. The largest, a splendid circle of gold one foot in diameter, bears the name of King Receswinthus, who reigned in the middle of the seventh century. This diadem is adorned with fine rubies, pearls, and sapphires, and round it runs a row of little crosses of carnelian and gold. From these crosses letters of gold and carnelian are suspended by golden chains, and these form the words *Receswinthus Rex Offere*—King Receswinthus offers (this). From these again hang twenty-four drops of gold and pearls, and below these are twenty-four pink rubies, each cut into the shape of a heart, so that a gorgeous fringe of golden chainwork and jewels adorns the crown, and a large jewelled cross is suspended from it in front. The second crown, supposed to be that of his queen, is not so rich as the first, but it too is adorned with precious stones, and fringed with rubies. The other crowns are of a very plain pattern, and are supposed to be the coronets of Gothic nobles. The inscription on the crown of Receswinthus shews that it was offered to a church, for it was not an uncommon thing for kings in the middle ages to hang their crowns above the altars of some famous sanctuary. Thus Canute gave his crown to Winchester Cathedral, and many of the cathedrals of the continent either have, or formerly had, royal crowns in their treasures. On one of the smaller coronets there is an inscription indicating the church which possessed these splendid crowns. The inscription is in barbarous Latin, and it may be translated: 'In the name of the Lord, Sonnita offers this to Santa Maria di Abaxo.' Now, a church of that name stands at the foot of the hill on which Toledo is built, full two leagues from the cemetery. How, then, did the crowns make their way to it? Not by theft, or they would not have remained there long. Probably, when, fifty years after the reign of Receswinthus, the Moors came pouring into the valley of the Tagus, and took Toledo, some Gothic priest or noble removed the crowns from the church, to save them from the plundering infidels, and, unable to take them with him in his flight, buried them in the cemetery of Fuente, hoping, doubtless, to come back for them at no distant day. But years on years passed before the Christians returned to victory from the Asturian hills, and then no one knew where the rich treasure was concealed, and

there it lay for eleven hundred years, until in our own days an accident brought the buried crowns to light, and the bright jewels which had passed long centuries in darkness, once more flashed in the sun.

Another ancient crown now in the regalia of the Austro-Hungarian empire has a singular history. It is the famous 'Sacred Crown of Hungary.' Tradition says that it was formed by the hands of angels for the sainted King Stephen; but history gives us the true story of its twofold origin, for the crown is partly Roman, partly Byzantine, and is, in fact, two crowns united, one above the other. The first was sent by Pope Sylvester II. to Stephen when he was crowned in 1001. It was a golden diadem, enriched with pearls and precious stones. Seventy years later, Duke Geyza, one of the Hungarian nobles, received as a present from Michael Ducas, emperor of the East, a splendid Byzantine crown; and when he became king of Hungary, he joined this circlet to the diadem, so as to make of the two a single crown. From the broad jewelled ring which forms its base spring four arches of gold. At the base of each is an enamelled portrait; the largest represents our Saviour; the others, Geyza himself, and the emperors Ducas and Constantius Porphyrogenitus. Four smaller enamels on the front of the crown represent the archangels Michael and Gabriel, and saints George and Demetrius. Besides the pearls, the stones which adorn it are sapphires, amethysts, and rubies, many of them rough and uncut, like those of the crown of Monza. At the back is a very large sapphire, surrounded by four green stones, on the precise character of which jewellers are not agreed.

This crown was regarded as the palladium of the Hungarian nation. It was more than a mere mark of sovereignty. They seemed to look upon it with a superstitious awe, as almost a living thing. It had its palace in the castles of Ofen or Vizegrad; the two nobles who were responsible for its safe keeping were among the highest officials of the kingdom; and under their orders they had a strong guard of picked men, who garrisoned the palace honoured by the residence of the Sacred Crown. No king could rule until it had been placed on his brow; if he died between his election and coronation, his name was struck off the roll of kings; and even a pretender acquired a quasi-right of sovereignty if he could, by fraud or force, secure possession of this double crown. In 1301, there was a disputed election to the vacant throne. The rival claimants were Robert of Anjou and Naples, and Prince Wenzel the Younger of Bohemia. War raged between the rival parties, and the prince had suffered some defeats, when his father Wenzel, king of Bohemia, came to his aid. Marching into Hungary, he occupied Ofen, seized the Sacred Crown, and taking it with him, returned to Prague, accompanied by his son. The Hungarians then gave up both claimants, and elected Otho of Bavaria; and, by some means which history does not record, most probably by paying down a good round sum of money, Otho succeeded in inducing old Wenzel to give him up the crown, without which his election would have been of little use to him.

In order to reach his new kingdom, he had to pass through the territories of Austria. Now ensues a series of strange incidents scarcely credible regarding the crown, which was for a time

contended for by rival kings, and at length lost. At last, being found, Joseph II. brought it to Vienna, but it was soon sent back to Hungary. During the revolution of 1848 it was in the hands of the Provisional Government, and on the defeat and flight of Kossuth, it mysteriously disappeared. Some said it had been brought to London, others that Kossuth had broken it up, and sold its jewels in Turkey. Neither report was true. A few months after, a peasant offered for a sum of money to restore the missing crown, and pointed out a tree, amongst the roots of which Kossuth and his friends had buried it, in order to deprive the Austrians of this symbol of sovereignty. It was solemnly restored to the castle of Ofen. 'It is only now,' said an Austrian statesman, 'that we are really reigning again in Hungary.' Only a few years ago the crown was brought from its castle under happier auspices, to be placed on the brows of Francis Joseph, as a symbol of the reconciliation between two great nations, when, after the crushing blow of Sadowa, Austria yielded all the claims of Hungary.

The ancient crown of Scotland, now in the castle of Edinburgh, has had adventures not unlike some of those of the Hungarian diadem. It is supposed to have been made for King Robert Bruce, and is formed of two circles of gold, the upper one being surmounted by a row of crosses and fleurs-de-lis, while the lower and broader ring is adorned with precious stones in their rough unpolished state. From this rise two arches of gold, which unite in a ball and cross. Even when the Stuarts became kings of England, they came to Scotland, after their English coronation, to receive this crown at Scone. Charles I. indeed wished to have the crown and regalia of Scotland sent up to London, in order that the ceremony might take place there, but this was regarded as an infringement of the rights of the kingdom, and he had to come to Scotland, where he was crowned, June 18, 1633. When, after his father's death, Charles II. asserted his rights in Scotland, he was crowned at Scone on January 1, 1651. On Cromwell's advancing across the Border, the crown and regalia were sent away from Edinburgh to the strong castle of Dunnottar, on the shores of the North Sea, lest they should fall into his hands. They were placed under the protection of a picked garrison, commanded by the Earl Marischal and Ogilvy of Barras, a veteran soldier. Several guns were sent to reinforce the castle, amongst others Mons Meg, and the great embrasure through which this monster was fired is still shewn at Dunnottar. On the 3d of January 1652, the Cromwellian general, Lambert, having closely invested the castle, summoned it to surrender. The summons was rejected, and the siege began. Ogilvy had previously asked that a ship might be sent to carry off the crown, sceptre, and sword of state; but Charles had not been able to comply with his request. It soon became evident that the castle could not hold out long, and it was therefore necessary to devise some plan for saving the regalia. The chief agent in the plot was the wife of the Rev. James Granger of Kinneff, a small church four miles from Dunnottar. She obtained from General Lambert permission to pass through his lines, in order to visit the lady of the castle, and on her return secretly brought away the Scottish crown. Her maid followed her, bearing two long bundles of lint, as if for spinning, but in one

of them the sword of state was hidden, and in the other the sceptre. On reaching Kinneff, she gave them to her husband, and that night they went into the church, raised a flag of the pavement in front of the pulpit, dug a hole, and buried there the crown and sceptre. In another part of the church they hid the sword in the same way. When, on the fall of the castle, the regalia were found to be gone, great was Lambert's indignation. Tradition says that he suspected the Grangers, and tortured them in vain in order to extort their secret. But suspicion was at length lulled to rest by the report that the crown had been sent abroad. Occasionally, the minister and his wife went by night into the church to change the cloths in which the crown was wrapped, in order to preserve it from the damp; and at the Restoration they gave up the regalia in safety to Charles II. A grant of two thousand marks rewarded Mrs Granger for her faithful service. After the Union, when, on account of the strength of the Jacobite party, the English government very unwisely exhibited, on many occasions, the mistrust with which they regarded the sentiment of Scottish nationality, the crown and regalia, as its most striking emblems, were shut up in a strong coffer in the crown-room of Edinburgh Castle. This took place in 1707, and there they remained for more than a century, until they were again restored to light by the commission appointed for that purpose in 1818.

Of the modern crowns of continental Europe, perhaps the most remarkable is the well-known triple crown or papal tiara, or perhaps we should say tiaras, for there are four of them. The tiara is seldom worn by the pope; it is carried before him in procession, but, except on rare occasions, he wears a mitre like an ordinary bishop. Of the existing tiaras, the most beautiful is that which was given by Napoleon I. to Pius VII. in 1805. It is said to be worth upwards of nine thousand pounds. Its three circlets are almost incrustated with sapphires, emeralds, rubies, pearls, and diamonds; and the great emerald at its apex, said to be the most beautiful in the world, is alone valued at sixteen thousand francs.

Napoleon had another magnificent crown made for himself in 1804. It was this crown that he so proudly placed upon his head with his own hands in the cathedral of Notre-Dame. It is a jewelled circle, from which spring several arches, surmounted by the globe and cross, and where the arches join the circle there are alternately flowers and miniature eagles of gold. After his downfall, it remained in the French treasury until it was assumed by another Bonaparte, when Napoleon III. made himself emperor in 1852. It is now in the regalia of France, which have only just been brought back to Paris from the western seaport to which they were sent for security during the Prussian invasion, just as the Scottish regalia were sent to Dunnottar. If we may judge from some of the German photographs of the Emperor William, the crown of the new German Empire is of a very peculiar shape, apparently copied from the old Carolingian diadem. It is not a circle, but a polygon, being formed of flat jewelled plates of gold united by the edges, and having above them two arches, supporting the usual globe and cross.

There are several antique crowns in the churches of the continent. One of the most interesting is that in the treasury of the cathedral of Aix-la-

Chapelle, which is an offering sent there by Mary, Queen of Scots. It is a gold circlet adorned with jewels and pearls. A still older crown is preserved in the great church of Namur. It is that of the Crusader king, Baldwin of Jerusalem. It consists of a jewelled diadem of gold, ornamented with leaves and trefoil, and in two of these ornaments are thorns said to have been taken from the crown of our Saviour. The tradition recalls the words of another king of Jerusalem, the chivalrous Godfrey de Bouillon. When, after the taking of Jerusalem, the crusaders made him king, and offered him a crown, he is said to have put it aside, saying: 'I will never wear a crown of gold in this city, where my God once wore a crown of thorns;' a reply worthy of Tasso's hero, the deliverer of the Holy Sepulchre.

### STEPHEN BELL, THE USHER.

IN EIGHT CHAPTERS.—CHAPTER I.

IN Onslope, a market-town not very many miles from London, stands, or did stand, some years ago, Hanover House, a large and flourishing academy for what is termed middle-class boys, who there received a middle-class education. There were about a hundred and fifty boys at Hanover House, and what they were taught—in the days before such minute and worrying inquiries about education were made—did very well; in fact, quite as much was done as any reasonable parent could expect, whether in teaching or feeding, for thirty-five pounds a year.

At this academy was an usher named Stephen Bell, who was the junior usher in two senses; he was the most recent addition to the staff; and as he taught no accomplishments or classics, but was simply an arithmetic and English master, he ranked below some of the others. But in another sense he was not a junior, as he was about fifty years old, and looked fully his age. He was a tall, hard-featured, silent man, who was seldom seen to smile, was not known to have any acquaintances beyond the few he had made in Onslope, or any friend in the world save his meerschaum pipe; and as he had repelled the advances of the far more fashionable and gentlemanly persons who were his coadjutors, he was regarded by all as a morose sullen fellow. Yet no particular ill-temper or vindictiveness was ever laid to his charge, and so it seemed that his was rather a solitary than a sullen temperament; at anyrate he was a lonely and avoided man in his little circle.

Few duties were more distasteful to the staff at Hanover House than one which fell according to *rotas*, to each in turn—always excepting the Rev. Josias Hamden, B.A., who, as a sort of exhibition or prize tutor, was exempt. Each in his turn, had to stay at Hanover House through the vacations, to take charge of such pupils as did not go home. The academy having a West Indian connection, there were usually several boys who had no English home; and, as newest comer, Stephen Bell had passed his Christmas holidays without a murmur at the school. But when midsummer came, Mr Barfield, the second master, was dreadfully mortified to know that it was his turn, and that the tour on the continent he had so long planned was still impracticable. Great, then, was his delight on finding that Mr Bell had

not the slightest objection to repeating his vacation stay, and in fact seemed rather pleased at the option of doing so being allowed him. In an hour he was the most popular of the ushers, for each of his comrades saw an escape from the most detested part of his duty. It is true that among themselves they suggested reasons which detracted from the credit due to Bell, such as reminding each other that he could save his board for five weeks, as the vacation-usher was, of course, provided for at the academy; and they hinted, too, that such an unsocial being was hardly likely to have many invitations. Nevertheless the fact remained the same, that he was the only man among them who was ready, of his own free-will, to pass in a house they all hated, and in a town of which they had all grown heartily sick, the period of the year when liberty was most coveted. Mr Barfield in the fulness of his heart proposed making Mr Bell a very handsome present, which he could well afford to do, as he was the wealthiest among the ushers—the pupils, indeed, whose friends, as a rule, were not extremely affluent, talked of a brewery in which his father was a partner, and of the fabulous riches which, in consequence, he owned—but Bell would accept nothing more than some choice tobacco from a certain eminent firm in London. This Mr Barfield ordered directly he knew his comrade's wish; and Bell, who probably looked forward to five weeks' uninterrupted enjoyment of his meerschaum—for he was much addicted to the weed—was soon gratified by the receipt of a large parcel of his favourite mixture.

Now the vacation approached, and all the young heads, which will to all time be upon young shoulders, were turned with delight at the prospect of going home; a thousand invitations were given and accepted, which were never afterwards kept or thought of; those who were leaving the school cemented eternal friendships, which did not last over the threshold of Hanover House; and, strangely enough, all the West Indian boys were this half-year invited by friends, relations, or merchants who were the English agents for their parents, to pass the holidays away from school. This was the first time such a thing had ever occurred, and had it not been arranged that little Alfred Rainwood, the youngest boy in the school, was to stay during the vacation, the usher would have had no one in charge at Hanover House. Alfred Rainwood was not yet ten years old, and was a slight and delicate child for his age; he had no father or mother, but was placed at the school by a firm of solicitors somewhere in London. He was so young that he had not reached Mr Bell's classes, as he and a few other juveniles were taught by an articled pupil, so the usher knew very little of him, and he knew very little of the usher.

The tender age of the solitary lad made it impossible for Bell to set him any but the lightest tasks during the holidays; indeed, had it been known earlier that he alone would have remained, none of the masters would have been kept back on his account. As it was, the vacation began with all the usual bustle of departing boys, their uproar and glee; the last box had been dragged out, the last hat waved from the last omnibus, and Alfred and the stern-visaged tutor alone remained to represent the school. The poor little scholar wiped away a few natural tears which rose

to his eyes as he gazed from a window on one side of the schoolroom, down the high-road in the direction of the railway station. His eyes had filled on seeing the last crowded omnibus disappear, but his grief was only momentary; for he had never known a dearer home than this school, or a kinder friend than Mrs Garney, the master's wife, who was, in truth, a kind and motherly soul, fit to have the charge of young children; and very much liked and respected by those who were older. So in his case there was not the exquisite bitterness which some poor boys have felt, when the hollow bang of the closing doors has shut the last gay holiday-maker from their sight.

Alfred was at one window of the schoolroom, at another was the silent usher, looking in the same direction as the boy looked, but doubtless with very different thoughts; he seemed, indeed, quite unconscious of his companion's presence. The child glanced timidly up at his teacher once or twice, as though anxious to address him, but the face never turning round, he at last slipped from the form on which he stood, and very quietly, with sidelong glance at Mr Bell, stole from the room. The usher, who hardly remembered his little charge, continued to gaze from the window long after the last vehicle had disappeared: then, filling his inseparable pipe, he sauntered slowly in the wide gravelled area, which formed the playground at Hanover House, and slowly paced its limits until the sound of the familiar bell—which usually appealed to so many expectants—called him in to tea.

The next day the usher, who was not a resident tutor, presented himself, with his invariable punctuality, at five minutes to nine, although Master Rainwood's studies were only to occupy from ten until eleven, and three till four o'clock, with an allowance of half-holidays entirely at Mr Bell's discretion. When ten o'clock came, came also the child, timidly, as was his wont, up the long, white, and empty schoolroom, to where Mr Bell sat, thoughtfully pulling his whisker, and looking, in the eyes of the scholar, very grim and terrible; but he spoke gently to the boy, more gently than seemed in keeping with his hard lined face. The easy lessons were gone through, and Alfred was then told he might amuse himself as he pleased, until the afternoon.

The boy again disappeared quietly, the usher lighted his meerschaum, and strolled about the playground, seeming to have no inclination to leave the premises, which, to his associates, felt so much like a prison. After a while, however, he sauntered with his aimless, listless walk, into a library which the boys had for their use, and there he stood gazing on the books, as though debating which to choose; in reality he had sunk into a reverie, which rendered him quite unconscious of the books, the room, the school. Suddenly, a small hand was laid upon his, and a very weak voice said: 'If you please, sir, may I have a book?'

Recalled to himself, the usher looked round, and looked down, and there was the childish face, the light hair, and blue eyes of the scholar. 'Have a book, my boy!' responded Mr Bell, with a sort of heartiness in his tone, which was assuredly not usual with him; 'certainly. What kind of book would you like?'

'Any one, sir,' said the child; 'any one that has

a good deal about pirates, or robbers, or wild beasts, or uninhabited islands, or shipwrecks.'

The usher took his pipe from his mouth, and looked with a strange smile at the frail little pigmy who was speaking, and then he stroked the boy's silken hair.

'Pirates, robbers, wild beasts, and shipwrecks!' he said. 'Uninhabited islands too! I suppose it is natural, though. Did you ever read *Masterman Ready*?'

'No, sir,' said the child. 'Is it very pretty and dreadful?'

The usher smiled one of his quiet smiles again, and again, with a thoughtful air, stroked the boy's curls, and looked at him as though he was looking far beyond him. He made a long pause ere he spoke. 'It is a wonderful book,' he said at last. 'But you shall read it, and tell me what you think about it then.'

'Is it true?' was of course the next question.

'Well, I won't say that everything happened as there set down,' returned the usher; 'but I can say that I never read it without believing every word of it.' He took the book from the shelf, and gave it to the child; and as he did so, moved by some sudden impulse, he stooped and kissed his forehead; then taking a volume for himself almost at random, he again sought the playground, and walked or sat, and smoked and read, save for the afternoon lesson and his tea, until twilight.

On the next day, at the conclusion of the morning's lesson, the usher said: 'I think I shall go to Lord Oakmount's park to-day, and fish. Would you like to go with me, Rainwood?'

The boy assented with a flush of surprise and pleasure which told how few had been his excursions.

'Very well, then,' continued Bell; 'I will let Mrs Garney know; and if she has no objection, I will take you with me; and that we may have a good long day, I will obtain permission for cook to pack up our dinners, and we will take them with us.'

This, as a delicious gipsying idea, somewhat like their being outlaws too, and certainly very like parts of *Masterman Ready*, so delighted the boy, that he could not say how pleased he was, but his smile told all.

Mrs Garney's consent was soon obtained, and indeed that kindly soul told the cook, when giving instructions about the dinner, that she was heartily pleased to see Mr Bell taking so much to poor Alfred, and that she should go to Margate—for the Garneys were quite fashionable people in their way, and made nothing of spending a fortnight or three weeks at a watering-place. It was owing to the pleasure she felt, probably, that the usher found, when he came to unpack the basket, a small flask of Mr Garney's particular port wine. But this is anticipating.

The two went together to Lord Oakmount's park; a splendid demesne of some seven hundred acres, with preserves and fish-ponds which were the envy of every sportsman and angler for a dozen miles round; and though it was excessively difficult for even the farmers thereabouts to obtain the right of a day's fishing, yet the usher had unlimited leave. His influence was with Walter Lamsett, the chief-keeper, a man well stricken in years, and reputed to be of a surly temper; he lived at the lodge. The lodge, by-the-bye, was by no means a

small house; it had been built by the earl specially for the use of Lamsett, after he had married and a family was growing up around him, so that it was much larger than is usual with lodges. Here lived the keeper with his only unmarried daughter, who, although his youngest child, was well past thirty years of age; and a certain service which the usher had been able to render him, had induced Lamsett not only to regard Bell as a friend—to which result the usher's taciturnity had perhaps contributed—but had caused him to obtain the freedom of the fish-ponds for his benefactor.

The heavy gate swung behind the usher, and its noise brought to the door Priscilla, the keeper's daughter. She greeted Bell very warmly, yet respectfully; indeed, there was a sort of awe in her manner, which, however, the usher seemed in no way to notice. Miss Priscilla begged him to take a cup of tea at the lodge on his return; and on his hesitating, said that she was sure the young gentleman would be tired, and require rest; her father too was out, and he would be so vexed if Mr Bell went back without sitting down in the lodge for a few minutes; indeed, he might think she had not made him welcome. Bell listened to this, looked at the boy's small white face and large eyes, with the grave absent manner which was so natural to him, and then accepted the invitation, much to the gratification of Miss Priscilla, who blushed like a much younger woman, while speaking to him. For was he not one of the masters at Hanover House, supposed, from that fact, to possess extraordinary powers of watching for mistakes and blunders in the conversation of those who spoke to him! Then the usher and his companion went on, and were soon lost in a wilderness of trees, ferns, and under-wood, nor did he once look round; had he done so, he might have seen, unless the flowers on the window-sill had hidden her, Miss Priscilla watching them as long as they were in sight.

The usher fished, and Alfred read *Masterman Ready* for some hours, and then, when the sun had dipped pretty low in the west, they prepared to leave. Not a dozen sentences had been spoken between the seemingly ill-assorted companions, but it was perhaps the happiest afternoon Alfred had ever passed. There was a sense of wildness and of forest-life, in lying there under the giant trees, by the side of an unknown lake, with mystery in the thickets beyond, but with a feeling of safety too in having his elder with him; freedom in the soft breeze which played around him, and in the carolling of the birds, and the occasional scamper of a hare or rabbit. The two, as already said, had scarcely spoken, save when Bell pulled in a fish; then the boy's eyes would sparkle, and he would utter an ejaculation of delight, which the usher would notice by a sympathetic smile: and so had the day worn until it was time to leave the lake.

So the boy closed his *Masterman Ready*, over which he had been furtively crying for several minutes, for he had nearly finished the book; the usher gathered his tackle, and they returned to the lodge. Here was their tea set out in great state; not only all the best china service, but Miss Priscilla too was seen in her Sunday black silk, and adorned with her watch and chain, for a visit from a master and a scholar at Hanover House was no ordinary matter. Little Alfred had never been

made so much of in his life, and he thought Miss Priscilla the nicest and kindest lady he had ever known, as he told Mr Bell when they came away. When they did leave, the keeper's daughter, in a somewhat old-fashioned style, thanked them for the honour of their call, and begged them to accept two beautiful nosegays, to remind them of their visit. Alfred kissed her very heartily for the flowers, while Bell, relaxing from his usual hardness, assured Miss Priscilla that he needed nothing to remind him of Oakmount Lodge and its inmates, but that he should, nevertheless, prize the flowers very highly. As Alfred said, when they got into the high-road, Miss Priscilla turned so beautifully red when they were bidding her good-bye, that she was like a rose herself, and it was in following up this remark that he pronounced her to be the nicest and kindest lady he had ever seen.

More the child might have spoken, but just then they were overtaken by a strange gentleman, who was walking a little faster than their sauntering pace, but who slackened as he reached them.

'Had much sport, sir?' said the stranger, with a glance at the usher's basket.

'Not a great deal,' returned Bell.

'I believe, however, that the ponds at Oakmount are reckoned very good,' continued the stranger. 'You are a privileged one, I presume, as I hear it is not easy to get a day's fishing there.'

Bell, as was his wont, stole a half-furtive glance at his new companion, in lieu of answering. He was a smartly dressed man, who was not very young, but who had a style about his attire which seemed to indicate a wish to be thought so. He was dark; wore plenty of jewellery; his moustache was too black and glossy to be quite natural; he had dark, quick eyes; and a profusion of black hair. This much Bell noticed before the stranger spoke again.

'And are you going to make an angler of this young gentleman? One of the pupils from Hanover House, I presume?—I thought so; but surely it is almost holiday-time.'

'Yes,' returned Bell, 'it is now the vacation; but he remains at the school during the holidays.'

'Indeed!' exclaimed the stranger.—'And do you like the school, my little friend? Don't you wish you were going home, eh?' With this, he sought to take Alfred's hand; but the child shrunk from him, and crept closer to the usher.

'He is a very shy child,' said Bell, in an undertone; 'and he has no home to go to, such as you are thinking about.'

'Oh, indeed!' said the other, elevating his eyebrows, as though he understood the reason of the boy's shrinking. 'But let me ask, have I the honour of speaking to Mr Bell?'

'My name is Bell,' said the usher; and a somewhat deeper glow flushed for a moment into his cheeks, as though the inquiry startled him.

'I thought so,' exclaimed the stranger. 'Pray, do not think me over-free; but I have heard of you. I am staying at the *Oakmount Arms*; and you know how, in these little country towns, the people will talk; so they talked of you among others, and very highly they spoke of you. I am out of tobacco, I find; and as I fancy I am a judge, I should like to try that mixture you are smoking.—Thanks.' He took a pouch from Bell, and filled his pipe. 'This is very capital tobacco,' he continued; 'but I think I have some as good at

my rooms. You will come round there to-night, and try it. Do promise.'

'I fear, not to-night,' said Bell slowly. 'I have one or two little engagements.'—

'Then to-morrow,' interrupted the stranger. 'Come, now; it will be a charity. I have been here a week, and shall have to stay some time longer; and really I don't know what to do with myself. This makes my invitation but a poor compliment, I know, but indeed its acceptance will be a charity.'

'I do not see how'—began the usher; but the other broke in with energetic arguments; and finally Bell promised to call at the inn on the next evening, at which the stranger expressed his delight, and gave him a small thin card, on which was engraved, 'Mr Lawrence Prior.'

## CHAPTER II.

The following day passed as its predecessors had done; the usher heard the pupil repeat his easy lessons, sauntered and smoked a few hours in the playground, had a long talk about *Masterman Ready*, and then, in the evening, found himself at the *Oakmount Arms*. Like many other silent men, and like the famous parrot, if he spoke little, he thought the more: the usher had many times during the day speculated upon the reason, if reason there were, of Mr Prior's taking such a sudden fancy to him. But when he kept his appointment, his first impression was that the stranger had really made his acquaintance from not knowing what better to do with his time; at anyrate, he was very glad to see Bell, and made him particularly welcome. Although he spoke of the nuisance of being obliged to pass several weeks in a wretchedly dull town like Onslope, he did not explain what his business was; but, whatever its nature, it justified or compelled his keeping a very handsome dogcart and very fast trotter, which were placed unreservedly at the teacher's service, if a ride of a dozen miles were at any time agreeable to him. This proposal was specially pleasing to Bell, who rarely had such a treat; and a certain dislike which, he was compelled to own, he had at first felt for his new friend, soon wore away, and, either at the *Oakmount Arms*, or behind the fast trotter, he found himself in his company every day for a week after their first interview. A freer, more generous man than Mr Prior—from a tavern point of view—it would be impossible to conceive; he appeared absolutely hurt if his friend offered to pay for anything, and his well-filled purse was ostentatiously displayed, to shew that he had the ability as well as the will to do the honours.

They parted somewhat earlier than usual one night with an agreement to meet the next afternoon, early, and drive to Cradley Common, there to dine at a certain woodside tavern, famous for the views it commanded. The teacher went a little out of his way to call at Hanoover House, partly to let the housekeeper know that he would not be there the next day, partly to see Master Rainwood before he went to bed. He left his message, and saw Alfred, who kissed him, and bade him 'good-night,' saying, as he did so: 'I wish, Mr Bell, you were going to sleep in my room. I should like you to tell me about all the books you have ever read.'

Bell laughed, and, as had grown his habit, passed his hand through the child's hair, and then patted his head. 'Good-night, my boy,' he said; 'you will hear enough of my stories some day, I warrant. When we go fishing again, if you ask me, I will tell you some strange stories of a friend of mine, who went abroad, and had some strange adventures.'

'Then we will go soon!' exclaimed the frail little fellow, who, like most delicate boys, had a craving for narratives of life and scenes he was the least fitted for.

The usher went home to his lodgings, two very humble rooms, in a small unfinished street at the country end of the town, where his reputation as a scholar, and his quiet, unobtrusive habits, had made him a great favourite. He enjoyed a quiet turn in the garden, with his beloved pipe, for twenty minutes before he went to bed; and as his landlady drew the curtains and closed the shutters of her back-parlour, she deemed that her lodger, as he paced thoughtfully round and round the little domain, was revolving in his mind deep and profound subjects, known only to scholars. But the good lady was much mistaken; he was thinking of the interviews past, and the interview coming, with his generous friend, Mr Prior. If Mr Prior supposed that the quiet, dull manner of his new acquaintance indicated a slow and unobservant temperament, he was very much mistaken, but perhaps Mr Prior had no such opinion; however this might be, the usher's reflections had reference to his new friend. 'If he has anything special to say to me,' he thought, 'he will say it to-morrow. The place is a very lonely place, and fit for confidential talk; he could say anything he pleased at the inn, of course, but some men feel a sense of freedom in getting to a lonely, out-of-the-way spot. He *must* have something to say. Why has he been so carefully sounding me as to my position, prospects, and whether I am in debt, unless he wants— And yet I don't know.' Bell smoked and walked with a still more thoughtful air. 'Not a night have we been together,' his reflections continued, 'but he has been artfully, and unsuspectingly, as he thought, pumping me. Telling me all his own affairs, too, with such candour; it's a pity some of his anecdotes did not agree with each other. I wonder who he is.'

It is evident from this brief abstract of the usher's train of thought, that unbounded faith in his new friend was not one of his weaknesses. Nevertheless he was punctual to his appointment on the next day, as was Mr Prior; the fast trotter and the dogcart were duly brought round, and away they rattled to the admiration of the three or four loungers who saw their departure.

The day was brilliantly fine; a little too warm, perhaps, for complete enjoyment, but the fast trotter conquered even that objection, by rattling the dogcart along so swiftly as to raise a breeze, and in some forty minutes they were at their destination. The *Plough*, for such was the name of the hostel they sought, was, as has been said, but a roadside public-house, but it was a roomy old-fashioned one, and being so situated that it commanded an extensive prospect, it was much frequented by pleasure-parties and excursionists. The favourite spot within its limits was an arbour, which was built on a knoll at the end of its

bowling-green, for here the visitor could sit and gaze over the greater part of three rich English counties; and here, then, sat Mr Prior and his friend, at tea. Tea had been ordered in deference to Bell's simple tastes; he was an old-fashioned fellow, he owned, but go without his tea he could not, and would not. This at first rather vexed Mr Prior, who was anxious to outshine himself in liberality this day, and proposed that, in honour of the exquisite scenery which lay before them, they should have out champagne, if the house kept it; or, failing this, they would have port or sherry. This temptation not sufficing, stronger drinks were proposed in turn, but steadily declined by the usher, and so perforce, tea was ordered.

Looking round somewhat quickly, Bell fancied he caught his companion's eye fixed on him with an expression almost savage; but as their glances met, Mr Prior broke into a laugh, and said: 'Do you know what I was thinking about, old fellow?'

The usher looked at him for a few seconds without replying, but this was not uncommon with him, and then said: 'No.'

Simple and natural as this reply was, there was something in the manner of the speaker which disconcerted his companion, who coloured a little as he went on: 'I was thinking what a queer fellow you would be on the seas, or in any loose-living country—I have been in some of the kind myself. Why, you couldn't live among the people for a week, with your old-maidish ways.'

'As the twig is bent, the tree is inclined, you know,' returned Bell; 'and I believe I was always fond of a cup of tea. Yet I like a social glass too, as you are very well aware.'

'But you are so confoundedly cautious—I mean particular,' urged Prior, who hastily checked himself, and changed the expression; 'one would think that you were a bishop at least. But here comes our tea, so now you will be happy.'

Bell smiled, and they sat down to the meal, which in his quiet way he seemed to enjoy, but which Mr Prior scarcely touched, although he extolled the quality of everything; nor, although he said twenty times more in praise of the scenery than did his companion, appeared he to be at his ease, for his speech wandered now and then, as though his mind was not in harmony with it, and he would rise and sit down again, and change his seat continually.

When tea was over, they strolled about the grounds, and over the common outside, for a long time, Mr Prior being again most pressing in his offers of stimulating liquor, till at last they had some. In obedience to his orders, wine was brought to where the trunk of a felled tree lay at the edge of the common, and there they sat watching the sun sink behind the woods, and the moon rise on the opposite side, without very much being spoken, save when Prior occasionally pressed more wine on his companion. The teacher drank pretty freely, but it was remarkable how closely he watched his friend as he poured out the wine; and once, when Bell had risen to get a light for his cigar, he found on his return that his glass had been filled: he feigned an accident to spill it. Prior was very sorry for this, and was anxious to supply the loss, but Bell refused to allow him, as there was but one glassful left in the bottle; and by an exercise of friendly authority he made

Prior drink it himself. The latter then went to the inn for another bottle, for, as he said, it would be a pity not to enjoy themselves thoroughly while they were about it. The night being very warm, he left his hat on the tree, and directly he was hidden from sight, Bell took it in his hands, hastily turned up the lining all round, and then replaced it. 'He seems all right,' he muttered; 'but I have been half afraid all the time that he was trying to put some powder in my drink. I thought it might be in his hat; I suppose I must be wrong, for I don't see what he could get by it. However, here he comes.' Mr Prior returned, and by the time the second bottle was finished, the moon was high in the heavens, and it was time to leave.

'Let us have just one turn round the common before we go,' said Prior; 'I will tell them to put the horse in the trap, and we shall be back by the time all is ready.'

'Agreed,' said Bell; and the order was accordingly given.

Prior was extremely anxious that they should have just one glass of brandy neat, to keep the wine down, before they started for their final stroll; but Bell was firm, and the idea was abandoned. They sauntered on in silence until their walk led them over the crest of a low hill, where they paused for a while to admire the beautiful effect of the moonlight, and each remarked upon the silence and solitude of the spot. While they stood there, Prior, as though he had that instant made up his mind, flung away the cigar he was smoking, turned suddenly to Bell, and said: 'Now, old fellow, will you make your fortune? You can do it, if you like.'

Bell, who had drawn hastily back at the other's unexpected movement, recovered himself at once, and answered coolly enough: 'How is it to be done?'

'Easily,' returned the other. 'But before I go any further, and say what I cannot unsay, just answer me this—are you tired of being poor, and are you willing to be rich without being too nice about the means? And are you willing to leave England for good and all?'

'You know that I am poor,' returned the usher; 'you have taken care to assure yourself of that; and I suppose you judge me to be a man of few scruples, or you would not be talking to me in this strain.'

Prior nodded, and smiled.

'I have very little to keep me in England,' continued Bell; 'the only bond I have is my situation, which I would throw up to-morrow, if it were made worth my while.'

'So far, so good,' said Prior; 'but that is not all. I want a man who is willing to do what is required of him, without caring whether it is strictly legal or not. A man who will carry out instructions, so long as he is himself safe and well paid, without troubling his head about the risks or motives of those who employ him.'

'You need say no more, to indicate the kind of man you want,' returned Bell; 'but allowing I am your man—and I believe I am—how came you to pick me out?'

'Because no one could do the work so well as yourself,' replied Prior; then lowering his voice, a perfectly needless precaution, he continued—'because you have the care of young Rainwood, and he must be got out of the way.'

Despite the habitual self-possession and command which Bell possessed, he turned with an exclamation of amazement at this speech.

'He must be got out of the way, as I said, for good and all,' repeated Prior, very slowly, and fixing his eyes with a searching expression on the other's face.

'Do you want me to kill him?' asked Bell, in his usual calm tone.

'No; I don't,' bluntly replied his companion. 'So far as I am concerned, I should be glad if he were dead, and would pay any one well who brought it about; but the preposterous scruples of those for whom I act, bar this plan. No; simple kidnapping and absconding are all that is wanted. Take him to South America, we will say, and bring him up there. He may still be called Rainwood, if you think it better, for it is no more his name than—than'—

'Than Prior is yours, probably,' said Bell quietly, finding the other paused for a comparison.

The man laughed, and said: 'I will not say whether you are right or wrong. But if you go into this business, you shall deal with persons whose names you may know, and who are solvent parties. Once for all, too, remember this—that if any accident happens to the brat, in any unhealthy country, you won't be held to blame. There are some who are too puritanical to agree to the safest course, but who would be thankful to any one who exceeded his commission a little when he was away. That, however, is a matter for the future; all we need talk of to-night is how to secure him; his living or dying afterwards will not affect you, except that you can never come back to England while he is alive, I should fancy.'

'You talk like a man of business,' said Bell; 'and evidently consider that I am one; but you have given me no hint yet as to what I am to have if I join you.'

'By Jove! sir,' exclaimed Prior, seizing and shaking his companion's hand, 'you are the man for me. No beating about the bush, but coming straight to the point. Now, then, for particulars.'

In the conversation which followed, and which lasted beyond the time at which they had intended to start, Prior unfolded his plans more minutely, and with every appearance of candour. He said that Alfred Rainwood was the grandson of a rich man, whose son had made an imprudent marriage. The son's wife was dead, and the young man, having seen his folly, would now contract a very eligible marriage, to his own benefit and his father's gratification, but for the existence of this child. Alfred would be heir to the entailed property, let his father marry whom he pleased, and have what children he might. Now, if he were away, say to a country from which he was never likely to return; away, too, from all danger of being recognised by those who knew the secret and who might make money, Prior owned, by threatening to betray it; then, circumstances would be changed. If even he came back in twenty years' time, the speaker urged, it would be next to impossible for him to find a clue, or to follow one if he had it. But a judicious man would prevent all possibility of such an occurrence, if that judicious man knew that he was to receive an annuity as long as the child lived, and as much by way of compensation, in case of his death, as would amount to ten times the yearly amount in one

sum; that man, if he possessed half the faculties his friends gave him credit for, would see that no such accident as his returning was possible.

The usher listened very gravely, and showed a perfect understanding of the scheme, and at its conclusion, asked whom he was to see on the matter beyond Mr Prior, and when his share in it was expected to commence. Prior reiterated his vehement expressions of delight at the other's remarkable capacity for business, and at once handed him a card bearing the name and address of a firm of solicitors known to stand among the highest in the country. 'You shall see the principal,' he said; 'I suppose such a man will be sufficient for you; but, of course, he will only talk of remuneration for the care of Master Rainwood, whose health requires him to go abroad, with compensation in the case of his death, or of his being removed from your care. You are not to discuss with him as to how the youngster comes into your charge.'

Bell signified his assent; and as the dogcart had long been ready, they mounted; and during the drive home, Prior was in wonderful spirits; indeed, the wine seemed to have taken much greater hold of him than it had done of the usher. He boisterously expatiated on the wild enjoyments of life in a new country, depicting scenes which might, perhaps, have roused a man of half Bell's age, but which were hardly so potent at his time of life, and so the usher reminded him.

'Don't you think,' he remarked, at the conclusion of one of these rhapsodies, 'that I may have seen as much of this kind of thing as I care to see? I am not a boy, you know.'

'Boy! No, of course not!' exclaimed his companion; 'I don't do business with boys; give me men with heads too old to be easily turned. But you have the life and pluck of a dozen green boys in you, and when you get abroad— But there! it is impossible to make a man who has never been in foreign countries, understand their pleasures and delights.'

A very curious smile stole for a moment over the usher's face, or so his friend imagined; but it might have been the mere effect of drawing afresh at his cigar, or the shade of a tree by the roadside, for ere Prior could assure himself that he was smiling, his face was as grave and cold as ever. They shook hands warmly at parting, and agreed to meet on the morrow; then Bell turned, and walked up the long silent High Street, which lay still and white in the moonlight; he was visible for a long time, a black spot moving slowly on, until a bend in the road shut him from Prior's view. For the latter had stood and watched him thoughtfully, with no trace on his features of the uproarious glee he had so lately exhibited; and when he lost sight of his quiet companion, he said, with something like a sigh: 'I am glad it's done. I knew my man, however; I was sure of him from the first. But he is a cold, selfish beggar, and as suspicious— How he watched me to-night! If I had been going to rob him, he could not have been more on his guard. But I managed him. I knew I should. You can always lead a greedy man—that is one comfort. Other weaknesses or passions are eccentric, and sometimes puzzle you, but love of gain never does. You have only to bid high enough, and it is a solved problem. But hang it! I am getting philosophical and oracular. Problems too! That comes of talking to a school-

master, I suppose.—Just a drop of brandy, my dear, in a bottle of soda; I shall not take any supper to-night.' This last phrase was addressed to the barmaid, for, during his soliloquy, he had sauntered up the inn-yard to the bar; and after this cooling draught—from which no human being surely ever derived the slightest benefit, despite its traditional sobering powers—he went to bed, feeling, as he mentally owned, 'rather floored' with his day's exertions.

### C A T S.

Cats from time immemorial have been favourites with the old and the young, the rich and the poor; and though at times persecuted by some thoughtless schoolboy, have upon the whole been received into the 'bosom of the family.' Dr Johnson sent out to purchase oysters for his pet Hodge when he was old and sick, and fancied no other food; and the poet, not content with cutting one hole in his library door to let his mouser in and out, fashioned a second smaller hole for the necessities of the kitten. What would Whittington be in history, or in our love and reverence, without his cat? Puss, however, generally falls to the favour of womankind. The Arab endows the cat by miraculous interposition at the beginning of the world, with the spirit of a gentle woman; and Dr Stables, with whom cats are 'darlings,' assures us in his book on *Cats*, that one sitting purring on the hearth-rug to the music of the hissing tea-urn, blinking her eyes before a bright fire, is the very personification of feminine virtue. Indeed, in this favourable view of pussy's lady-like character, he was preceded by Mr Broderip, who tells us, in his *Zoological Recreations*, that the cat is closely connected with the untranslatable word 'comfort'—a word that has neither name nor representation out of Great Britain. The doctor gives us but little if any, reverse to this amiable picture; but surely out of doors all likeness to womankind must cease, for we cannot be so ungallant as to follow the simile on to the tiles, or compare a cat parliament, with its unearthly noises, to the sweet and dulcet vocalisms of the gentler sex, however gossiping may be their tendency. If cats could always be kittens, redolent of fun and mischief as a school-girl, we might be disposed to admit some resemblance, but the comparison becomes flighty and far-fetched when it reaches our chimney-pots. However, cats are so greatly petted under the doctor's pen, that they can afford a little wholesome detraction. It is an interesting sight that of a cat teaching a kitten its future duties, in which domestic cleanliness, as well as mice-hunting, bears an important place. Some instances are given in which greediness is reproved by the mother, but not one in reproof of the errors of late hours. What open atmospheric influence is it that changes cats' nature, swearing and spitting at each other—fur-pulling and blood-letting being then their great delight, which nothing short of a descending boot or the discharge of a loaded blunderbuss seems sufficient to disturb?

Their self-denial under the harsh and trying treatment of children is one of the cat's greatest traits. Baby may squeeze Tom almost flat with the grasp of an infant Hercules, drag him by the tail, and otherwise cause cries of anguish to escape from the patient creature; but during all this manifest

suffering, its formidable talons remain sheathed in 'the velvet of its paws.'

We are told that the temper of a cat is to be known by the demeanour of its tail. When the tail is erect, it is pleased; when angry, it lashes it; and when excited and about to spring, the tail quivers. Mr Broderip says the tail changes in its expression as its owner outgrows its early innocence, and develops its treacherous and cat-like nature. The tail of the kitling before the blood of mice has reddened its incipient whiskers has no deceit or malice in it; it is carried about honestly bolt upright, rigid or oscillating in a paroxysm of fun. It lengthens or limbers, until, as the mature puss sneaks round the chicken coop or prowls in the larder, its air and motion betray all its changeable nature. The tail of the veteran mouser varies as content or passion sways its owner. Purring in your lap, puss waves it coquettishly, or droops it in drowsy satisfaction. But the same tail, when its proprietor is cornered by your terrier, becomes a veritable bottle-brush, in which each particular hair stands on end, as if electrified with anger.

A cat's liking for fish is proverbial, and its aversion to water equally so. Yet cats have often dived after fish and brought them ashore, and they have been known, after being transported many miles, to swim rivers, in their irresistible anxiety to return to their homes. How artfully a cat will pick a gold-fish out of a glass globe! Indeed, some admirers maintain that fish is puss's only weakness, which alone prevents its being perfection. We knew a cat that went grayling-fishing with its master, and would, if allowed, have gone in and landed every fish, in defiance of the hook.

A black cat was always associated with witches, for 'they together went to sea, each one in a riddle or sieve, and went in the same very substantially with flagons of wine, making merrie, and drinking by the way in the same riddles or sieves.' The two or three white hairs which almost invariably shew on the chest of black cats, if taken in ale, was supposed to be a sure protection against sorcery. Superstitious notions about cats are endless; but are happily now dying out. At one time, it was actually believed that if a cat were admitted to a nursery, it would let blood from a child's temple by licking it with its rough rasp-like tongue, under which operation the child would become exceedingly drowsy, and waste gradually away.

An old farm-house in Derbyshire obtained the notoriety of being haunted. It was visited by a member of the society for the 'laying of ghosts,' who, sitting up with a goodly supply of toddy, and a broomstick, routed the goblin at the deadly hour of night, having found her swinging to the bell-handle, which communicated with most of the chambers, and to which bell-pull, country fashion, a hare's foot had been attached. The habit of cats lifting latches has frightened many a lone woman, for the animal has the cunning to hide until the door is opened, and then to creep in unobserved. Cats attracted by cream will get their heads fixed in the mouths of jugs, and then the noise made by their attempts to release themselves, will suggest to the shivering wakers the notion of burglars; while housebreakers, in their turn, have been known to imitate the noise of cats, to cover the operations of their picks and files. It may, however, be well to know how to remove the noise

of cats from a too close approximation to your windows. A few sprigs of valerian thrown on a distant meadow will collect them in conclave for many nights together. They are likewise passionately fond of the little garden-flower nemophila. They no sooner scent it, than they throw themselves upon it, and roll over and over with the greatest sense of enjoyment.

Chickens are a cat's *bonne bouche*, and eggs they do not despise. A butterman gave a cat a broken egg. Fatal gift! from that day puss would seize every opportunity to roll an egg off the counter. If the smash was unheard, she would lap up the yolk, rubbing the shell amongst the sawdust, to prevent discovery, and then mount again amongst the eggs, to repeat the character of Humpty Dumpty.

That birds, however apparently safely hung in cages, are unsafe from the skill and cunning of the cat, may be gathered from many instances of the extraordinary leaps they are capable of making to attain their prey. We are told by a reliable authority that when his cat was a year old, he was seen several days in succession to take his position on a show-case four feet high, licking his chops, while watching a canary in a cage, suspended from the ceiling eight feet from the case. The ceiling was eleven feet high from the floor, and the cage an ordinary cylindrical one. While thus observing the cat, and thinking how remote was his chance of plunder, the animal suddenly sprang at the cage and caught his claws in it. His weight swung the cage up against the ceiling, spilling seed and water, and terrifying the canary. After swinging to and fro for several times, the cat dropped to the floor uninjured. Our informant measured the distance from the top of the cage, and found it to be ten feet; so that the cat made an ascent of six feet in eight, or upon an incline of nearly thirty-five degrees. The surprise here is that the bird escaped; for it is during its terror, and while beating itself from side to side of the cage, that the hooked claws of the cat are prepared to receive it; and if any portion of the bird is caught, it is rapidly pulled through the wire, and the cat and bird disappear before the spectator can recover his astonishment.

It is supposed that hitherto the culinary value of cats has been confined to China and Japan. Our Eastern friends may have long held the monopoly, but the Parisians now follow suit. According to *Galignani*, there are a few cat-butchers in that city of gourmands, who will give a good price to the rag-pickers for a puss dead or alive, provided it be fresh and fat; their skins are sold to the furriers, their fat to the frying-shops, and their flesh to the low eating-houses. A certain amiable naturalist who has tasted almost everything under the sun, says, that a well-fed cat is superior to an Ostende rabbit. Prodigal as we are of cat-life, kittens were recently quoted in the New Zealand price-lists at from one to three pounds each, and a grown cat from four to seven pounds. A tortoise-shell Tom exhibited in Piccadilly a few years ago was valued at a hundred guineas; and the Rev. A. W. advertises one for sale, in the *Animal World* of February 1875. 'A cat perfectly black, nine months old,' is likewise offered for sale on April 1st in the same journal. As long ago as the days of 'Howell the Good,' in the year 948, that Welsh king enacted that the price of a kiting before it

could see was to be a penny; till it caught a mouse, twopence; and when a skilful monser, fourpence. Those who stole or killed a cat that guarded the royal granaries were to forfeit a milch ewe, its fleece and lamb, or as much wheat as when poured on the cat, suspended by its tail (the head touching the floor), would form a heap high enough to cover the tip of the tail. A short time since, 'the rage set in so strong in Brussels for Angora cats that fabulous prices were asked, and dealers stole the cats that were bought from them one day, and sold them again the next, to satisfy the demand.'

Cats have been known to assume the office of protectors, and to have sprung at persons who have attempted to assault their masters or mistresses. A cat in a suburb of London accompanies two children in their perambulator. Should a dog approach its protégés, apparently under the conviction that the daily diet of the canine tribe is babies, it bushes its tail; and if the warning not to come nearer is not taken, it springs upon the back of the intruder, sticks its claws and teeth into its hide, and sends it off faster than it came.

When cats once take to the coppice after game, the habit becomes incurable, and the keepers consider themselves justified in knocking them over. Cats sleek and fat, having no excuse for poaching, have been known to take to these predatory practices, which usually brings them to an untimely suspension on the gallows-tree.

The tenacity of life in cats is marvellous, and they are known to have survived the most brutal treatment. But let us hope that this is of the past. It is no longer permitted to set the bull-dog or the terrier after every stray cat, neither are they hung up in couples by their tails over a clothes-line to tear each other to pieces, nor shod in walnut-shells, thrown from church towers with a blown bladder tied to their necks, sent to navigate the horse-pond in a bowl to be hunted by curs; for such 'games' would be now visited with severe penalties. Doubtless, therefore, with a more healthy feeling of humanity, one may soon hear of a Feline Asylum, as in Florence, supported by aristocratic and wealthy patronesses, as is now the case with us for our other domestic companion, the dog.

A cat will leap from an immense height to escape from confinement, and the way she comes upon her feet, says Dr Stables, is curious. When she first leaps—too often barbarously kicked—she turns over belly upwards in a semicircle. To avoid coming down thus and dislocating her spine, she extends the muscles of her back and stretches her legs. The convexity is now reversed, and with it the centre of gravity, and in this position she alights on her feet. Professor Owen's experiences would, however, not endorse this statement, for he tells us that he had a cat which fell from a tower of his villa, and although having plenty of time to take a turn, came down upon its head, and knocked out one of its eyes.

Several anecdotes are told by Dr Stables of the affection of cats unto death, and he more than confirms that of Mr Broderip by similar facts, such as how a favourite cat would not be parted from its dying master—was with difficulty driven from the sick-chamber—and even after the body was

Compounded with the dust whereto 'twas kin,

would return again and again to the grave, although repeatedly chased from the churchyard, and there lie braving cold and hunger for hours.

Knowing what we do, we are not disposed to be credulous in regard to one or two of the anecdotes related by Dr Stables. For instance, we are inclined to believe that some other explanation might be found than the one which he attributes to his own favourite puss, which, having a liking to sit upon paper, distinguishes between two journals of different politics, preferring the Liberal organ to the Conservative! Her preference is so manifest and decided, that if she by accident lies for a moment upon the Conservative sheet, she immediately detects it, and removes for a comparatively permanent doze to that of the broader tendencies. As if anticipating scepticism on the part of his readers, the doctor gives a long list of names and addresses of his living authorities, as vouchers for the authenticity of the anecdotes he relates.

The chapter devoted to 'Feline Ailments' appears to have received great care, and treats apparently of every ill that cat is heir to, with their remedies, amongst which is grass, which in towns should always be gathered and placed within their reach. Fits, consumption, diarrhoea, bronchitis, mange, the yellows, dysentery, milk-fever, and inflammation, together with diet and housing, and amputations, are in this chapter, the reading of which has made us feel more than ever a sympathy with poor puss, and inclines us to forgive her selecting, say, our wife's velvet bonnet, or carefully folded shawl, as a litter for her kittens. If, however, cats do not share a perfect paradise on earth, the poet has prepared for them a feline Elysium:

There shall the worthies of the whiskered race  
Elysian mice o'er floors of sapphire chase,  
Midst beds of aromatic marum stray,  
Or raptured, rove beside the Milky way.

The following is a good story, told in the *Ladies' Own Journal*, of a robbery being detected by a cat. A lady in Liverpool had a favourite tabby which always received her with manifest pleasure upon entering the house. One Sunday, however, upon returning from church, she was surprised to find that pussy was not there to greet her, and its continued absence made her a little uneasy. The servants had not seen her, and a search was instituted. Upon the mistress descending to the basement, her calls of 'puss' were answered from the wine-cellar, which had been properly locked, and the keys placed in apparent safe custody. As the cat was in the parlour when the lady left for church, it was unnecessary to consult a 'wise man' to ascertain that the servants had clandestine means of getting into the wine-cellar.

A few instances are current of cats attaching themselves to persons and accompanying them from one lodging to another, and even from hotel to hotel in a long tour; and there are others in which cats have made their way through crowded towns to regain their homes. The following, in relation to the latter, we give upon our own responsibility. Our family removed from Camberwell to Pentonville, the first a south-west suburb of London, the other north. A cat, which was much attached to our dog Dandy, was accidentally left behind.

After the first day at our new abode we missed Dandy, and great was our grief. Two mornings afterwards, just at sunrise, we heard his favourite signal-bark, and hastening down to open the door, in walked Master Dandy, accompanied by the cat; the dog repeatedly running backward and forward between us and the cat, to explain his absence. Nor was he satisfied, early as was the visit, until he had reintroduced the cat to every one of the household. These two faithful companions must have jogged together through numberless streets, even in the dead of night, when these were not altogether free from dangers to the feline tribe. This dog Dandy is made honourable mention of in J. H. Fennell's *Natural History of Quadrupeds*.

And this reminds us to venture upon a special word for puss, when master and mistress are removing to summer quarters. In the hurry and bustle of packing for the country, many things are forgotten, and amongst others, sometimes the cat. Uneasy at the unwonted stir, puss will often retire from her accustomed hearth, kitchen, or laundry, and wander in quest of quiet. This is natural to it; but—unless having provided otherwise—let not that cause Materfamilias or Jack to forget to provide a basket, and take puss too. The summer quarters may be too remote even for Dandy.

#### A MOTHER'S PRAYERS.

FROM THE GERMAN, BY ANTONIA DICKSON.

THE sweetest sound heard through our earthly home—  
The brightest ray that gleams from heaven's dome—  
The loveliest flower that o'er from Earth's breast rose—  
The purest flame that, quivering, gleams and glows—  
Are found alone, where kneels a mother mild,  
With heart uplifted, praying for her child.

The stream of tears can never cease to flow  
Long as Life's sun shall shine on us below;  
And many angels have been sent by God  
To count the tear-drops wept upon Life's road;  
But of all tears that flow, the least defiled  
Are when a mother prays beside her child.

Because it is to mortal eyes unseen,  
Ye call it foolishness, a childish dream.  
In vain; ye cannot rob me of that thought,  
That legend, with such heavenly sweetness fraught,  
That blessed angels have for ages smiled  
To see a mother praying for her child.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

## A PLEA FOR THE SEAL.

No one could have walked the streets during the late winter and spring without observing the prevalence of seal-skin jackets as an article of female attire. The wearing of skins, no matter of what kind, as closely fitting garments, is of course seriously detrimental to health, by excluding exhalation from the body. But on that we are not going to expatiate, well knowing that where female fashions are concerned, all remonstrance is useless. What we propose to speak about is the extraordinary trade in seal-skins which has sprung up in consequence of the universal mania for dressing in these articles. We all know that skins cannot be manufactured like calico, but come from the backs of animals, and that at best there is a limited supply. Hence the prodigious prices given for seal-skin furs. When procured, the skins are usually, in the first instance, sent to London, where periodically large sales at auction take place, which are attended by dealers from all parts of England and the continent. A few months ago, at one of these sales, two seal-skins brought as much as eighty-four pounds—the highest price, it is believed, ever attained in the London market.

Seals, we need hardly say, cannot be reared like sheep, nor do they naturally congregate on sea-coasts in a temperate climate. They are to be found in some of the northern British isles, particularly Shetland, but only in small numbers. To procure them in abundance, we need to go much farther into Borean regions, such as Greenland and the north-west of Norway. Incited by the mercantile demand, the seal-fishery in the North Sea has latterly been carried on upon a scale so extensive as to threaten the annihilation of the animal. Horrid cruelties are practised. The seals which have just brought forth their young are killed wholesale, leaving their helpless progeny to perish. The custom has been to begin the seal-fishing—more properly seal-killing—in March; but reasons have been shewn for postponing the butchery till April. Female seals,

about to produce young, are swimming about in great numbers, preparing to take up their temporary abode on the ice, over shoals frequented by their favourite food. But the vessels are lying in wait, and begin their ruthless work. In two or three days, thousands of young seals are heard piteously crying after their slaughtered mothers. Even supposing the mothers to be as valuable as usual for their skins and oil, such is not the case with their poor helpless progeny, who are worthless when newly born. So destructive in this respect was the fishing twelve months ago, that the captains feared that the number of young left in a condition to furnish a supply for the present season (1875) would be seriously diminished. They all agreed that they committed this error, but each excused himself because the others did it. The difficulty is to get a united action among the different nationalities engaged in this cruel and destructive procedure.

Moved by the prospects of a ruined trade, as well, perhaps, as by motives of humanity, the proprietors of sealing-vessels in Norway, Scotland, and other countries have had some conferences on the subject. The question has also been under consideration by the Board of Trade and Foreign Office. It has been proposed to have a close time; but unhappily there are different opinions as to when the close time should terminate. A common opinion is, that April 5th and May 15th should be named as the opening and closing days respectively. The Swedish minister for foreign affairs, M. Björnstjerna, has stated that the Norwegian vessels from Tönsberg and Christiansund are about equal in number to the Scotch from Dundee and Peterhead; that the chief seat of the fishery is at and near Jan Mayen Island; and that the produce of the fishery is gradually lessening, owing to the reckless mode of conducting it, by the killing of the mothers before the pups are old enough to cater for themselves. (We may here remark that Jan Mayen Island is situated between Iceland and Spitzbergen, and is described by Lord Dufferin in his *Letters from High Latitudes*.) M. Björnstjerna points out that a treaty between England

and Sweden would not alone suffice, because sealers belonging to other nations would not be bound by it; and suggests that the Earl of Derby should open communications with all the maritime governments interested in the matter. When, early in the present year, the resolutions arrived at by the Dundee Conference were communicated to the Norwegian sealing owners and captains, the latter almost unanimously declared that the opening date above named was too late, and the closing date too soon; that a much longer time than forty-one days may safely be allowed for the fishing; that most of the pups are born about March 22d or 23d; and that, if the opening of the fishery were delayed beyond the 1st of April, it would frequently happen that all chance of a successful result would be sacrificed, either by the breaking up of the ice or the setting in of warm weather. Still more decidedly did they assert that May 15th was too early to close the fishing, as there are numbers of seals well worth capturing for some weeks after that date. Out of twenty-six Norwegian owners and captains, twenty-four recommended the dates April 1st and June 30th—thus giving ninety-one days of open fishing instead of the Scotch proposal of forty-one days! A woful difference this, shewing how much has still to be done before the experienced doctors will be able to agree about the mode of treating a malady which they all admit to exist. A commercial reason is assignable for the difference of opinion here expressed. The Scotch vessels are mostly larger, and employ more hands than the Norwegian; the captains wish to get their seal-fishing over as soon as they can, in order to proceed afterwards to fish for whales—an arrangement which does not so well suit the Norwegians. There have been some negotiations with a view to a remedy during the present year, but as yet nothing is done. The slaughter goes on as far as it can be effected, and will probably do so, till the colonies of seals in the North Sea are exterminated. The sufferings that meanwhile must be experienced by the poor motherless seals, wailing for food, and calling, we may say, for pity, are too painful to contemplate. The wearers of seal-skin jackets do not seem to be aware of the cruelties inflicted on these harmless and unfortunate animals.

So much for what we may call the ordinary seal-trade. We turn from it to give some account of the method of seal capture and traffic in the Pribylov Islands, a group connected with the province of Alaska, which was purchased by the United States from Russia in 1867. Here, things appear to be better managed. Although the Pribylov Islands embrace only an area of less than sixty square miles, they have, up to the present time, proved to be of greater commercial value than the half-million square miles contained in the territory on the mainland; for these islands—or rather two of them, there being four in all—are the principal resort of the seal in the northern hemisphere. Indeed the number of fur-seals which annually

visit the island of St Paul, in lat. 57° 8' north, long. 170° 12' west, is computed at between five and six millions.

Another of the islands, St George, about twenty-six miles to the south-east of St Paul, is the resort only of some quarter of a million seals; while the remaining two islands, Otter, five miles south of St Paul, and Walrus, six miles to the east of the same, are frequented principally by the walrus, and at certain seasons of the year by huge flocks of sea-fowl.

The trade in furs has always been one in which the first cost of the article has borne a singularly small proportion to the price it ultimately commands in the market. The late John Jacob Astor, reputed, at the time of his death, to be the richest man in the United States, laid the foundation of his enormous fortune (estimated at ten millions sterling) by his success in the fur-trade. He was wont, indeed, in his latter years to declare, that when, as a young man, he went into the wilds of the state of New York with his pack on his back, he had often purchased of the Indians for strings of beads, each of which had not cost him quite sixpence sterling, skins which, when cleaned and dressed, had commanded in the London market as many guineas. Of course the skins passed through the hands of various individuals, each of whom made a profit on them, before they were sold at the last-named price. Still, making every allowance for this fact, the gains of Astor were enormous in proportion to his first outlay. Even at the present time, although the profits realised in the fur-trade seventy years ago are no longer to be obtained, the difference between the first cost of a skin, or *pelt*, as it is technically termed, and the retail price is very considerable. For instance, the natives of St Paul are paid a uniform sum of forty cents (about one-and-eightpence sterling) for each seal-skin they procure, while the value of the same skin in London, before it is cleaned or dressed even, ranges from twenty-five shillings to two pounds; and when dressed it is worth from three to eight pounds, according to the quality.

We may mention, incidentally, that the North American fur-trade generally is at the present time in a state of transition. The monopoly so long enjoyed, and so jealously guarded, by the Hudson's Bay Company, of the products of the vast territory that owned their sway, having terminated, the Americans have pushed their way over the frontier, and established factories in various parts of the settlement, some of their stores being situated on the banks of Red River, almost under the shadow of the walls of Fort Garry itself. By this means, thousands of skins are annually collected from the native trappers and hunters, and forwarded *via* St Paul's, Minnesota, to New York, for shipment to Europe. Formerly, the delay and expense had to be incurred of sending the furs the whole distance from York Factory to England by sea; and the inhabitants of the Hudson's Bay Territory had to await

the return voyage of the ship for such supplies as they required from Europe. Now, the round trip can be, and is frequently made by the route above indicated, in less than forty days. The result of the greater facilities thus afforded for reaching the European market has been a considerable extension of the trade; several thousand more skins being forwarded to England annually, than were shipped by the Hudson's Bay Company when the business was exclusively in their hands.

After Alaska and the adjacent islands had become the property of the United States, several mercantile firms, with the enterprise characteristic of the American people, at once sent vessels, properly fitted out for sealing, to the Pribylov Islands; and so great was the number of individuals to whom the idea of doing this had simultaneously presented itself, that, had not Congress promptly intervened, the traders, in their eagerness for an immediate profit, would simply have exterminated the seals in a very few years.

A recent American writer indeed says: 'With the exception of our seal islands, there are none others of much importance in the world; the vast breeding-grounds in the antarctic having been, by the united efforts of all nationalities, misguided, short-sighted, and greedy of gain, entirely depopulated. Only a few thousand unhappy stragglers are now to be seen on the Falkland Islands and contiguous islets, where millions once were found; and small rookeries are protected and fostered by the government of Buenos Ayres north and south of the mouth of the Rio de la Plata; but the seal-life on the Pribylov Islands—thanks to the foresight of the Russians—has been preserved to the present day in all its original integrity.'

Congress wisely adopted the plan of leasing the islands to a Company, upon the condition, that not more than one hundred thousand seals should be killed annually, and of these none should be under one year of age. A lease embodying these stipulations was granted to the Alaska Commercial Company of San Francisco. It was for twenty years, from 1st July 1870; and the Company agreed to pay a royalty of two dollars fifty cents (ten shillings sterling) per pelt, in addition to a fixed rental for the islands of fifty thousand dollars (ten thousand pounds) per annum. Thus the United States government derives an income of very nearly sixty thousand pounds from this property; whereas Alaska itself, we believe, so far from contributing one penny to the federal treasury, has up to the present time absolutely been a charge upon it, though it is probable that this will soon cease to be the case.

The operations of the Company are confined for the present exclusively to the island of St Paul; and the period chosen for capturing the seals is from the date of their first arrival in June up to about the end of August.

The killing and skinning of the seals is done for the Company entirely by the natives of the island; and so rapidly is the work executed, that last year the whole hundred thousand were secured in rather less than thirty-five working days.

One portion of the island is used by the seals as a breeding-ground. Adjoining this spot are long stretches of sandy beach, upon which are found the 'holluschickie' or bachelor seals in tens of thousands, packed, usually, quite close together. The men to whom the task of capturing the day's

quota is intrusted, come down to the shore from the village, which is a short distance inland; and after a careful examination of the densely crowded masses of seals, select two or three thousand of the most suitable animals, usually males, between the ages of two and four years. Half-a-dozen men suffice to separate the seals selected from their companions; and they are then driven, precisely as sheep would be, to the village. Their powers of land-travelling are much superior to those of the common seal (*Phoca vitulina*) of our coasts; they move forward at the rate of about half a mile an hour with the most perfect docility, requiring only occasionally a little gentle urging. Stretched out in long files as they travel, a drove of three thousand will frequently be upwards of a mile in length.

Arrived at what are termed the 'killing-grounds,' which are two or three sandy fields in the outskirts of the village, the seals are allowed to cool; for the journey heats them, and if killed while in that condition, their fur either falls off, or can be pulled out easily. When the poor animals have recovered from the fatigue of their journey, twenty or thirty men, armed with heavy clubs, despatch them, by well-directed blows on the head, in batches of three or four hundred at a time. The seals are skinned as soon as possible after they are killed, for if the weather be at all warm, the bodies will become so swollen and decomposed in a few hours as to injure the quality of the fur.

The natives are very expert at their work, and some of them will take the hide off the body in less than two minutes; but the usual time required for the task averages from four to five minutes. The skins are then taken to the salt-houses of the Company, where they are spread out on benches in layers, one over the other, with salt thickly sprinkled over the inner surface of the skins; and after lying in pickle ten days or a fortnight, fresh salt is thrown over them before being done up in bundles for shipment.

The fur in its natural state has a very different appearance from that presented by the prepared skin; for, while in course of being dressed, the overhair is pulled out, and the fine close, soft, elastic fur is changed, by dyeing, from its original yellow or ochre hue, to a rich dark brown. Great care is required in doing this, and indeed it is said that only half-a-dozen furriers in Europe understand the art of properly dressing seal-skins.

We have drawn attention to the American system of carrying on the seal-trade in Pribylov Islands, in order to shew how much less destructive it is than that pursued by European sealers. The reason for this is obvious. It is conducted by a company, who act under statutory obligation, and who, for their own interests, take care to preserve the breed for future seasons. They are not so infatuated as to 'kill the goose that lays the golden eggs,' but keep the goose laying. Such are the advantages of fixing on a rational plan of operations, which is in all respects more profitable, as well as more humane, than if the matter were left to chance, or regulated only by private greed. We do not hear of those piteous wailings of young motherless seals in the Pribylov Islands, such as, with heart-rending inveteracy, are reported in connection with the North Sea fisheries. The cruelties there practised, chiefly for the sake of oil, are

simply a disgrace, of which all concerned, we think, cannot fail to be considerably ashamed.

[Since writing the above, an act of parliament has been passed, authorising the British government to adopt measures in conjunction with Norway and other countries to regulate the capture of seals, and restrain the destructive cruelties complained of.—Ed.]

## STEPHEN BELL, THE USHER.

IN EIGHT CHAPTERS.—CHAPTER III.

ALTHOUGH Mr Stephen Bell had walked so long and so late in the garden at his lodgings as to excite the alarm of his landlady, causing that sympathetic old person to lie awake for hours, and to peep cautiously from her window, and to say to her husband that Mr Bell would drive himself into a fever with so much study—although he walked so late, he was up at his usual time in the morning. In answer to his landlady's kind inquiries, he assured her he felt very well; but the good lady was not to be so deceived, and told her husband that Mr Bell looked worried and anxious, as if he hadn't been to sleep all night.

At his appointed time, too, the usher was at Hanover House, and on his way to the schoolroom he met the cook, who said: 'You'll excuse me, I know, Mr Bell, but if I was you I shouldn't let Master Alfred do his sums and that, this morning.'

'I will not, cook, if you think he should not study,' returned Bell. 'But is he ill?'

'O no! not exactly ill,' exclaimed the cook; 'but he has got a bit of a headache, and it would do him more good to go for a walk, I know. But, lor bless you, Mr Bell, he is that anxious to please you—for he has took to you wonderful—that if he was a-dying, he wouldn't ast you to let him off his lessons.'

The master smiled, and assured the cook that he would see the little fellow amused himself out-of-doors for that day. He went on to the schoolroom, while the cook, returning to the kitchen, told the housemaid what had passed, and added, that there was a feeling heart in Mr Bell, as nobody would think, to look at him.

The object of this eulogium found, on entering the schoolroom, his little pupil awaiting him, with book and slate in readiness. 'Suppose, Alfred,' said the usher, 'that instead of doing long division this morning, we go for a walk. What do you say to that?'

'Oh, that would be beautiful!' exclaimed the boy, brightening and colouring at once.

'Then, where shall we go?' continued the usher. 'Shall we go across the fields to Marley Copse, or walk over to Friar's Mills? Which shall it be?'

'I should like, if you would not mind,' said the child, 'to go to that beautiful park again, where we went the other day; if you don't mind, you know.'

The usher having no objection, in a very few minutes Alfred had put the books out of sight, and the pair had started for Oakmount Park.

All the way there the boy talked of *Masterman Ready*, and the adventures of the family on the island. His tutor led him on to talk, and seemed to take a great pleasure in listening to his wishes, crude and childish though they were, to see foreign lands. At the lodge gates they met a very big, stern-looking old man, a man whose hair and whiskers were white, but whose eyes were fierce and dark, and who was altogether of the harsh aspect that Alfred had always decided Paul Jones and Captain Kidd must have possessed. Mr Bell, however, shook hands with the big man, who asked who the 'young gen'tman' was. On being informed, he patted Alfred's head, and told him to be a good boy, and mind his book, for learning was a wonderful thing. 'And that reminds me,' he continued, 'that I saw the surveyor yesterday with his lordship, and his lordship says: "Mr Rule," he says, "here's your friend Lamsett.—Well, Lamsett," his lordship says, "have you beaten any more surveyors or architects lately?" His lordship will never forget that joke. I knowed I was right, Mr Bell, all along; but if you hadn't a come up and worked out them calculations, and drawn that plan in the manner you did, I should have been beat. Come in and have a glass of ale and a crust.—Nonsense, man; my ale never hurts nobody. And I'll lay something, Pris can find a gooseberry tart, or something of the kind, for little master here. Lor,' he muttered, 'what a little creature it is!'

While speaking, he had led the way, followed by the others, into the lodge, where Miss Priscilla was preparing for dinner. The keeper's daughter appeared to more advantage in her neat cotton dress, with her smooth, dark hair pushed back, and in her plain white linen collar, than in her garment of state, even her black silk. Her father's commands were obeyed with great alacrity, and a lunch, somewhat more substantial than the invitation had foreshadowed, was soon spread. As before, Miss Priscilla was very attentive and kind to the child, who, on his part, appeared to grow very fond of her. On hearing the usher say that he had promised Alfred a stroll through the grounds, Priscilla said that Mr Bell would doubtless meet his friend there. 'My friend!' echoed the usher; 'if I found a friend anywhere, it would surprise me greatly; but I do not know whom you mean.'

'O Mr Bell,' exclaimed Priscilla, 'do not say so; you must have many friends, I am sure. But I spoke of the gentleman from the *Oakmount Arms*.'

'From the—from the *Oakmount Arms*!' cried Bell. 'Why, how does he come here, and why do you call him my friend?'

'I call him your friend, because he calls himself so,' said Miss Priscilla. 'He applied at the lodge, about half an hour before you came, for permission to walk in the park, and used your name as his introduction.'

'The dence he did,' said Bell. 'Well, if so, it was like him.'

'Oh, that was the young fellow I saw as I came

down the slope, was it?' said the keeper. 'I was going to ask about him, only seeing Mr Bell put it out of my head.'

'He is not so very young, father,' returned Priscilla, 'although I fancy he tries to look so: looks like what—from all I have read of them, for I have never seen one—an actor looks when off the stage.'

'You are right, Miss Lamsett,' said the usher; 'that is just what he does look like.—Well, Master Alfred, would you be willing to stay a little while with this lady?—You would not mind taking charge of him, I am sure.'

Of course Priscilla could make but one answer to this, and so it was arranged that Alfred should stay at the lodge, while Bell went for a stroll in the woods by himself, with the desire, as he owned, of meeting the gentleman from the *Oakmount Arms*. So he went on, and looking back from the top of the slope, waved his hand to Alfred and Priscilla, who were already very busy picking peas in the garden. 'He may as well be there as anywhere else,' muttered the usher; 'the poor little creature seems to have no friends who care a groat whether he lives or dies, so if I—— Oh, there he is then.' At this moment he caught sight of the object of his search, stretched at the foot of a tree, in the shade. Whether he had seen Bell or not, the usher could not be sure, but he gave him credit for having done so, and for dexterity in assuming surprise, when hailed by name.

'Why, this is an unexpected treat!' he exclaimed, as Bell drew nigh. 'I took the liberty of using your name at the gate, and found it a perfect passport. Rather queer people there, I fancy, the male party especially; looks a regular old rough.'

The other frowned, as though this criticism was not exactly to his taste, and without another word, Mr Prior changed the subject.

'I suppose you still mean business,' he said, 'for you don't seem one of the men who take up a thing overnight, as if they were red-hot, and who drop it in the morning, as if it had grown red-hot instead.'

'My mind has not changed,' said Bell.

'No, of course not; I knew that,' continued Prior, yet he seemed a little relieved on hearing Bell say so. 'Then we can talk here as well as at my place. Now, I suppose you want to know the next step to be taken?'

'I do,' returned his companion. 'I am, of course, pretty certain that you are here under a feigned name, but for that I care little. If I knew your right name, I probably should be no wiser, and no more inclined to take your word than I am now. I mean, you see, because I should know really no more of you. But these lawyers I can trust. They may be ever such scoundrels, and I daresay they are, but Maine, Firth, and Maine have a reputation to keep up, and to keep it they must preserve faith with all who do business with them. Now, when can I see them?'

'To-morrow,' responded the other promptly.

'Shall you go with me?' asked Bell.

'No,' said Prior. 'I will write to the head of the firm, to insure his being in the way, and he will be there, never doubt that, when he hears you are coming; but I shall not go, for the fewer the merrier, in cases like these.'

'Very well. I see nothing to prevent me from

running up to-morrow,' said Bell thoughtfully. 'I need not call upon you this evening as arranged, for we can settle at once as to the time of my seeing Mr Maine. Then I will leave you, for little Rainwood is at the lodge, waiting my return.'

'What!' exclaimed Prior, raising himself on his elbow—'what! the child himself! Why did you not bring him here?'

'Well, I don't know,' returned Bell. 'I thought I should find you; and as we might have a little confidential talk to go through, that perhaps he had better not come.'

Prior rose quickly to his feet, laid his hand on his companion's arm, and speaking with a look on his face differing very much from his usual lazy careless air, said: 'I ask you why you did not bring him here? No shilly-shally with me—it won't do.'

'What do you mean?' exclaimed Bell, shaking him off, and returning his angry look with a scowl, for which his harsh features were specially adapted, and which caused Prior, even in his excitement, to recoil a pace.

'I mean this, you know,' continued the latter, with an attempt to maintain his air of threatening; 'that it is of no use your being mealy-mouthed with me. You must not pretend to wonder what I mean, and all that; and you must remember that we are all swimming in deep waters—yourself as much as any of us.' Although his words were 'brave words,' yet the tone in which he spoke had an unsound ring, and as he finished, he drew farther from the usher.

The latter spoke after a very brief pause. 'Don't prate to me,' he said, 'of your swimming in deep waters, and such mad talk. What I promise to do, I shall do as I like, and not as you like. Be careful you talk no more to me in that way about the boy, or suppose that because I am in the scheme, I shall let you dictate to me. And understand me once for all'—here he swore a terrific oath, the first Prior, or any one in the town of Onslope, had ever heard from his lips, and its sound, with the fierce expression of his face, caused Prior to turn as pale as ashes—'understand me, I say, that whatever I agree to do with the boy, I agree to do myself, and that I mean to hold him safe from every one else; so, if you are wise, you will neither threaten him, nor meddle with him, for if you do, and but a hair of his head suffers, I will kill you. I don't mean any figure of speech, my man; I swear I will kill you. So now we are clear on that point.'

'Clear!' gasped Prior, passing his hand across his forehead, as though he felt the sweat upon it—'clear! What an unnecessary burst you have indulged in. I—I only wanted to see the youngster. But I can make allowance for a man who thinks he has been unduly interfered with, and I don't bear any ill-will. Come! we are as good friends as we were before. I hope?'

'We are,' said Bell emphatically. 'I give you my word, and you may safely pledge yours, that we are quite as good friends as we have been at any time since we have known each other. Now, tell me at what time I am to see your London lawyer.'

Upon this a brief conversation ensued, and at its conclusion, with very little leave-taking, the usher turned abruptly from his associate, and strode down the hill towards the lodge. Prior

watched his progress, and muttered some half-intelligible sentences, which were not very complimentary to his friend. 'A selfish brute,' he said. 'I believe he would kill me, as he says, even if he came back from the antipodes to do it. Yet that makes him all the better man for our purpose. I like one of your stubborn characters, for if he would murder me, as I am sure he would, he is just the man—for all his pretence of defending his charge—when it suited his purpose, to'—Here he checked himself, and seemed afraid, even in his solitude, to finish his reflection aloud.

The same style of greeting and the same offer of hospitality as on the previous occasion, were shewn at the lodge, and Alfred seemed fonder than ever of his new friend, who, on her part, asked the usher to allow him to spend the whole of the day, at least once during his holidays, at the park. Bell hesitated, and made the stereotyped objection that he feared it would be troubling them too much; but Priscilla pressed the invitation, and the usher, with some abruptness, gave consent. He left the lodge with Alfred, and, at parting, pressed Priscilla's hand more warmly than he had ever pressed it before. But the thoughts that appeared to be in his mind as he did so, need hardly have crimsoned her face, or caused her to sit in a reverie for ten minutes after he had gone.

'Do you remember your father or mother, Alfred?' said Bell, breaking a silence which had lasted for the greater part of the way home.

'No, sir,' said the boy, looking wonderingly at his questioner; 'I don't remember anybody but my friends at the schools. Sometimes I think I can remember my mother coming to look at me when I was in bed; but I am not sure; it might have been a governess. I used to go to a girls' school, you know, before I came to Hanover House, and I never had any vacations.'

'What!' exclaimed Bell, looking down at his tiny companion; 'did you never have any holidays at all?'

'Once I did, and that was such a nice one,' returned the boy, his eyes sparkling at the recollection of the treat. 'I went home with Master Brownlow; his mamma told him to ask me for a week. We did have such fun there, to be sure.'

'Ah, I daresay you did,' said Bell, who seemed willing to let him talk. 'It was very kind of his mamma.'

'O yes,' assented Alfred; 'and she is such a nice lady. She keeps a public-house, you know.'

'Indeed,' said Bell, as the child paused after this announcement.

'Yes, a public-house,' repeated the boy; 'and we used to have such games in the stables. They had a lot of pigs too, and once I fell into the trough, and made myself in such a mess. But Mrs Brownlow was not in the least angry.'

The usher made no response, and, lacking his encouragement, the conversation flagged; but the tenor of his thoughts was evident from his glancing more than once at his companion, and ejaculating just above his breath, 'Poor boy, poor little boy.'

When the afternoon lessons had been duly gone through, Mr Bell left, first informing the house-keeper that he would not be at Hanover House next day.

For on the morrow he had important business

to transact, the first part of which consisted in calling on his friend at the *Oakmount Arms*; and having been furnished by him with a letter of introduction to the lawyer, he took train for London. The address given was in a respectable street—an aristocratic street it had always been considered—near a West End square; for the greater portion of the firm's business lay among a circle which preferred to transact it at what they considered the private abode of the principal, rather than in the more orthodox region where the regular office was situated. Whether these private clients gained anything by their privilege, they were better able to tell at the conclusion of their business, than at its commencement.

On knocking at the door, Bell was admitted, not by a clerk, as he had supposed he would be, but by a fashionable and imposing footman; the hall, too, upon which the door opened, was so spacious and gorgeous a place, that Bell, not usually impressionable, was rather staggered, and doubted if he had not made a mistake. 'I was to call here, I think,' he said, 'to see Mr Maine, of the firm of Maine, Firth, and Maine; but'—

'What name, sir?' asked the man; and on being answered, continued: 'Quite right, sir. If you will be good enough to step into this room, Mr Maine will be with you directly. He is expecting you, I know.'

So Bell was shewn into the great lawyer's study, and a very comfortable room he found it; but some time elapsed before Mr Maine appeared. At last he came, accompanied, as Bell rightly guessed, by his head-clerk. Mr Maine was a very old gentleman, and his clerk was nearly as old. The lawyer was stout, bald-headed, very short-sighted, and asthmatic: the clerk was a tall, thin, very quiet man, who seldom looked up, or around him; indeed, Bell doubted if he had even noticed that there was a third person present, when he first entered the room.

The conversation need not be detailed; it was of the most commonplace description; it was no matter what Mr Maine thought, he evidently did not intend to let anything escape him, and it was equally clear that he did not intend to allow his visitor to travel out of the record. One or two attempts which Bell ventured upon, to see how far Maine and Prior were working together, were completely snubbed, and the usher tried no further. After about ten minutes' conversation, Mr Maine gave his attendant certain instructions as regarded the drawing up of a deed which Bell was to sign on a future day. 'Whether do you think,' continued the lawyer, 'a week or a fortnight will be the most convenient time for your journey?' This very slight hint, if indeed it were meant as one, was all he suffered to escape him, as shewing that he knew of, or guessed at, possible difficulties in the way. Bell said that a fortnight would probably suit him best; and then, while his clerk was jotting down the heads of his work, the old gentleman asked Bell many questions about the country around Onslope, which he seemed to know thoroughly; and the usher interested him very much by telling of his success in the fish-ponds at Oakmount Park, for the lawyer had been in his day an expert angler. At last, the instructions were completed, and Bell, having now nothing to wait for, rose and took his leave—the clerk not having spoken once during the whole time.

## CHAPTER IV.

The holidays were now really holiday-time to Alfred Rainwood, for he had no lessons to learn, and nearly every day he was with his new friends at the lodge, to the great delight of the cook, who, in the absence of Mrs Garney, reigned supreme. She thought it was a great deal better for the boy than poring over his books, and was greatly pleased to find that Mr Bell agreed with her. The usher had grown still more silent and reserved than before, and even little Alfred understood that he must talk less to him now, although, when Bell spoke, his tone was kinder than ever. Mr Prior, too, found a difference, for Bell, so far from seeking his society as a man with an interest in common might be supposed to do, decidedly avoided him. They saw each other, nevertheless, every day, and Prior always had the hearty, boisterous welcome for his friend; but it was quite understood on both sides that this was only a hollow show, a mere pretence of keeping up a friendly connection. It may seem strange that Prior should tarry at Onslope, under the circumstances, but it might be that he was determined not to lose sight of his coadjutor until things were more in train; or perhaps he felt that he acted in some degree as a spur to his resolve. Be that as it may, he remained at Onslope, and it was wholly owing to his contrivance that he and Bell met nearly every day.

A week of the fortnight had elapsed, and during that time the usher had once again visited London; the day after this visit, too, was the only instance in which he had sought Prior. He went to the *Oakmount Arms*, where he was pretty sure to find him, and without any preface, put several cards into his hand, saying briefly: 'I was there yesterday.'

Prior glanced at them; they were all from shipping agents and outfitters, and he nodded his approval. 'That is what I do so like about you, Bell,' he said; 'you are such a fellow for business. I had not spoken to you three minutes, on the first day we met, before I had entirely made up my mind about you. I hear you told Mr Maine that you could go in a fortnight. How time flies! Why, it is half-gone already.'

'If you had noticed the dates,' returned the other, 'you would have seen that no ship sails for San Francisco—it is there I mean to settle—quite so early. You need not look spiteful over it, as the delay is very trifling—and we cannot help it.'

'My dear fellow,' exclaimed Prior, 'take your time; pray do not imagine for a moment I wish to hurry you. Nothing is further from my thoughts, and—talking of hurrying reminds me that you must have time for a social glass this morning. It is so seldom that you will join me.'

Bell smiled the quiet smile which Prior liked so little, and complied, his companion all the while telling him what articles would be of most use where he was going, and urging him to take a couple of good revolvers, the proper management of which he would shew him. He dilated, too, a great deal on the character of the society Bell would meet at San Francisco, and the best mode of dealing with it; but it turned out that, in reality, he had never been to California, and only spoke from a kind of general newspaper knowledge of the place.

Much sooner than Prior wished, Bell rose from the social board, and left, directing his steps to Oakmount Park, and as he walked thither, fell into a reverie deeper than were his customary thoughts; so absorbed was he, that on turning an angle in the road not far from the park gates, he stumbled against a man, whom he recognised as the 'boots' at Hanover House. The man touched his hat when he saw who it was, and Bell, with a sort of half-apology, went on, vexed at his own stupidity. He found Alfred busy in old Lamsett's garden, and it was wonderful what an improvement the last few days had wrought upon the child. He had lost much of the paleness which had seemed natural to him, and had gathered something of the nice ruddy glow which an English boy should always wear.

'I am going to run away with your little friend for a short time, Miss Lamsett,' said the usher. 'I shall take him for a walk in the wood; and to-morrow, I think, I shall take him to London.—How would you like to go to London for a day, Alfred?'

It need hardly be said that the boy's eyes glistened at the idea, or that he at once asked whether they should see the Queen and her palace, and St Paul's, and Westminster Abbey, and the British Museum, and twenty other famous places about which he had read; and then gladly left the garden to go with the usher. They struck off from what may be called the main road of the park, and pushed their way through ferns and underwood where the trees made a gloom in every direction, and suggested to Alfred Indian jungles and North American forests, where tigers might roam, or warriors with their tomahawks and scalping-knives might lurk. Starting off on these themes, the usher listened to the boy's animated prattle with a pleased yet melancholy attention.

At last they came out on an open place, in the centre of which lay a small lake, and here Bell told the boy they would rest. As it was just the place for an ambush if an enemy were near, or for the hunter to await the lion coming to drink, it suited the imagination of the child.

'Do you like these walks with me?' asked Bell, very suddenly.

'O yes, sir, very much,' returned Alfred. 'I never was so happy before.'

'I suppose not,' said the other, musingly, and looking thoughtfully at the child. 'Then if some fairy—but you never speak of fairy tales, I notice—should appear, and order that we were to go, by magic, of course, to some foreign land, all wild like this, only of immense extent, you would not be frightened?'

'Frightened!' laughed the boy; 'I wish the fairy would come now.'

'Perhaps she may,' returned Bell, smiling in turn, but his smile was very different from the boy's. 'Fairies are often nearer than we think, I daresay.'

'I wish she would appear, then,' continued Alfred. 'I do so like to hear of foreign countries, and pirates, and——O Mr Bell, do you remember that you once promised to tell me some stories about a friend of yours? I like to hear true stories, you know, like *Musterman Ready*—at least,' faltered the boy, seeing his mistake, 'stories which sound true, like that does, you know.'

'Well, Alfred,' said the master, after a pause, 'I

will tell you something about my friend, whom you may see some day.'

'See him!' exclaimed Alfred; 'then he is still alive!'

'O yes, he is alive,' replied the usher; 'and I will tell you what happened to him many years ago. He was a—a Frenchman.'

'I am sorry for that,' struck in Alfred, 'because, you know, Frenchmen are not so brave and enterprising as Englishmen.'

'This was a very unusual kind of Frenchman, Alfred,' returned the usher gravely; 'in fact, you would have taken him for an Englishman. But you may some day alter your notions about Frenchmen, Alfred. Well, this Frenchman—my friend, you know—could not thrive very well at home, and so he decided on leaving England, and going to Ceylon, where he had obtained an appointment.'

'Oh, he lived in England, then?' said the boy.

The usher stroked his upper lip, as a man does who wears a moustache—a trick he often had, although he wore none—before he replied: 'Yes, he lived in England. I forgot to tell you that. He sailed for the East Indies in a very much smaller vessel than usually made the voyage, but it was cheap, and he was poor. His wife went with him, but they left their only child, a pretty and interesting girl of thirteen years old, in England.'

'Was his wife a Frenchwoman?' asked the child, who evidently could not get over this unfortunate nationality.

'No,' said Bell; 'no; she was a good, affectionate, devoted English wife beautiful in her husband's eyes, at any rate. They had married when but boy and girl, and her only fault was in loving him too much. It was a dreadful pang to part with their little girl, but she was delicate, and they dreaded the climate on her account, and so they left her behind. The little vessel had a very fair passage until long after they had rounded the Cape, but then there arose one of the fiercest and most prolonged storms that the oldest sailors on board had ever known, and she was driven an immense distance out of her course. When at last the crew regained the mastery over the ship, she was not far from the southern coast of Arabia—you know where that is upon the map. It was thought desirable to run her close to the land, to find some sheltering inlet where the damages received in the storm could be repaired. They had not, however, been on the coast many hours before a ship hove in sight, which proved to be a pirate.'

'A pirate!' echoed Alfred, whose eyes grew larger as the story increased in interest.

'Yes,' returned Bell, 'a pirate. Not such a pirate as you read of in story-books, but they were a cunning and bloodthirsty crew, nevertheless. Had the ship not been disabled, or had she been as large as the East Indianmen usually were, this vessel would have passed on, and carried such cargo as it had to some market, and waited for another opportunity; but as it was, the temptation was too great for the pirates, and they came up before the light wind very fast indeed. The English crew made signals, and fired their only cannon, to attract the stranger's attention; but it was soon evident what kind of a craft she was, and how much better it would have been had she not seen them at all. She was crowded with a half-naked set of Arabs, and in

every hand a sword, or knife, or long gun could be seen. The English captain tried to get away, but in vain; and some of the crew determined to defend the ship, although they were hardly more than one to ten; so they armed themselves as well as they could, and signalled to the Arabs to keep off, but, of course, to no purpose. On came the vessel as fast as ever, and two or three of the English fired at her, in the desperate hope of checking her course; but no one—very fortunately for the lives of the Europeans—was hurt by the weak volley. It was enough, however, to draw a heavy fire from the Arab ship, which was now within a hundred yards of them. The crew saw their pieces levelled, and all instinctively crouched behind the bulwarks—the bulwarks are the sides of the ship, Alfred.'

'Yes, yes; I know,' said the boy impatiently.—'I know all about ships. Please, go on.'

Bell continued: 'They crouched down, and so escaped harm. My friend was among them; but scarcely had the sound of the firearms been heard, ere a piercing shriek arose from behind him. He knew at once what had happened, and springing up, was just in time to catch his wife as she staggered forward. Roused by the noise of the firing, she had run upon deck to see what was the matter, and a bullet—Here the speaker paused, and smoked his meerschaum steadily for a few seconds, looking fixedly the while into the wood beyond the little lake. The lad was about to urge him to continue, but there was something in his companion's face which prevented him. 'A bullet struck her,' continued Bell, as though he had not left off at all—and he did not seem aware that he had done so 'in the breast; and when he caught her, she was a dead woman. You will not understand if I tell you that my unfortunate friend has thanked Heaven a thousand times that it was so. In an instant, with fearful yells and cries, a hundred dark figures flung themselves upon the ship's deck, as the pirate craft struck with tremendous force against her sides. No resistance was offered, it was so evidently hopeless; but two or three of the foremost seeing an English lady fainting, as they thought, dashed forward to secure a still greater prize than they had expected. My friend, desperate with his loss, struck—though only with his clenched fist—the first brute who touched his wife, and was himself instantly cut down by the sword of a pirate. He would have been killed on the spot, but that they saw the lady was dead, and murderers and robbers as they were, they guessed the truth, and spared her husband. He lay for a time insensible, for they had no doctors there, and the gash was a severe one, extending from the crown of his head down below his temple; but he did not die. The men among whom he had fallen were not wholly pirates, and they had a sort of rude faith and honour with them, which, especially after he again lived among civilised beings, my friend has more than once admiringly dwelt upon. They did not massacre the crew; they let them go, and ransacked the ship; but my friend they detained for two reasons—first, because he was wounded in defence of his dead wife, and then because, as he was not dressed like a sailor, they thought he was a priest, and so rendered more respect to him.'

'When once they had decided upon keeping him at all, they took jealous care that he should not get away, lest he should carry information to

European nations of their haunts. So he lived with them until he became at last a desperate man, and at length threw in his lot with them. He professed their religion, wore their costume, and went on their expeditions; though he never joined them against his own countrymen. This they might not have allowed; they might have insisted on his fighting when they pleased and with whom they pleased, but that the man who had cut him down, and who was a powerful sheik, or chief, protected him. The chief was influenced to do this by another person; and could the stranger really have made up his mind to take the Mohammedan religion, as he feigned to do, and dwell as an Arab on the Arab coast, he might have been at this day a powerful chief also.

'But he never married again,' said Bell, speaking in a higher key, after another brief pause, and, as the boy thought, striking very unexpectedly into a reflection which had nothing to do with his story; 'and after many weary years, during which he had fought more than twenty times in desperate and bloody, but nameless skirmishes, and had seen such fearful deeds and awful retaliation as would make we will say our friend Mr Prior,' he continued, with his quiet smile, 'tremble but to hear of them; when he had grown to regard his life carelessly, charmed though it seemed to be, as a thing he might lose any day or any hour, the old sheik spoken of gave him his liberty. That the old man should do so, was the dying request of the most gentle and amiable member of his family; and so, very quietly, for some would have prevented him, the Frankish stranger was placed on board a vessel from the United States. He had acquired some wealth, partly from his share in successful forays, and partly from trading; not a very great deal, but enough to set him above actual want for his life, although he concealed the fact from all whom he came afterwards to know. It was well that it was so, for when, after a very short stay in California, whither his ship was bound, he landed in England, he found that a penniless man had better be in Arabia.'

'What did he come to England for? Why didn't he go to France?' said Alfred.

'To France!' returned the usher. 'What did he want in France? O yes—I forgot; you mean because he was a Frenchman. True; but then, you see, his little girl was in England. He did not, however, know where to look for her. The proprietors of the school at which he had placed her, of course would not keep her when the term for which they had received payment had expired. These proprietors were dead; but with much trouble he found an old servant who remembered his Kate—her name was Katharine, so was her mother's. This old servant recollected that she had been apprenticed to a milliner, but the milliner was gone away, and nearly all trace was lost. At last he heard that his daughter was dead, had died very unhappily too; and then he stood alone in the world, without a soul with whom he could claim kindred. Now, Alfred, you see that all stories of fighting with pirates do not end so brilliantly in real life as they do in story-books, for my friend would be glad, after all his adventure and strife, glad and proud, Alfred, if he knew he had won the love and esteem of even a poor little orphan schoolboy like you.'

He ceased, and rising from the grass, led Alfred back towards the lodge, neither speaking for some time; but Bell, although an observant man in many respects, fell into the very common error of underrating the penetration of a child. A childish mind is sometimes as capable of drawing inferences, especially where it is interested, as that of a man thrice its own age; and Bell never dreamed that Alfred had often wondered why there was a large bare seam on the usher's head, over which he carefully brushed his hair; or that, while he was telling the story, his little companion's eyes were continually examining part of a terrible scar visible just below his hat. Alfred knew as well that Bell was relating his own history as the usher himself did; and a gentle pressure of the hand which held his own small fingers was a mute way of shewing how the boy loved and sympathised with his friend.

They reached the lodge, and there was old Mr Lamsett as bluff and hearty, and yet as fierce-looking as ever, and as energetic as ever in his invitation, which the usher eventually complied with. The keeper added another to the claims he already possessed in the child's eyes of being regarded as a sort of woodland outlaw, by shewing that the buttons of his waistcoat were all composed of real foxes' teeth; from these the transition, in Alfred's mind, was so easy to wolves and bears, that he quite resolved to place Mr Lamsett along with the heroes of the rifle and the bow, with whom his memory was well stocked. But Alfred wondered to hear the keeper invariably refer to the victory gained by the usher over Mr Rule the surveyor; indeed, it appeared to be considered by him as one of the most memorable events in his life. It was plain, even to the child, that Lamsett was a very ignorant, though shrewd man, and that he consequently held scholarship—as he kept terming it in high respect; therefore, the fact, that Mr Bell had been able to beat the surveyor with his own weapons, proving him wrong, and the keeper right, evidently raised the usher very high in the keeper's opinion. Alfred's expedition to London was of course spoken of, and the keeper, after expressing his wonder that any one could live in such a 'mizmaze' of a place, gave the boy a bright half-crown to spend. This was the largest sum of money Alfred had ever possessed at once; pocket-money, indeed, he had none, for the dole of three-pence each Saturday, authorised by most parents whose sons went to Hanover House, was not allowed in his case. The school-bills were paid the week after they were sent in; and whatever clothes were required, were at once ordered, but nothing more than this; nothing in the way of pocket-money, or the smallest parcel, ever came to Alfred—save from a very unusual source. Mrs Garney contrived that the lad should sometimes have pence to spend, and, finding out his birthday, made him then a considerable cake; but other friendly attentions he had known none. So he immediately arranged, in consultation with Miss Priscilla, for the purchase of a number of articles much coveted by boys, and which would probably cost about seven or eight pounds, all of which was to come out of his half-crown. To these details the cook at Hanover House was also an attentive listener, as he sat with her for half an hour before going to bed, and very pleased was cook to find that the child was making friends.

On the next day, they went to London; and on the bewilderment, delight, and almost fear, with which Alfred rode through the great city, we need not here dwell. It will be sufficient to say that Mr Bell devoted himself to amuse the boy more earnestly than might have been expected from one of his saturnine disposition: every place they had visited, and every wonderful sight they saw, being duly detailed to cook by Alfred on his return, tired as he was, ere he went to bed; and to Miss Priscilla, on the following morning. Among other strange things which he narrated, was how he went into an immense shop, which was quite as large, he should think, as Onslow church, and where there were millions on millions of coats, and all that; and there Mr Bell had bought, oh! so many clothes; and for fun, they had made Alfred dress himself in such strange coats and cloaks. But this incident was merely an episode in the day's adventures, and of far less consequence than the steamers, and the omnibuses, and the crowds in the streets.

After Alfred had gone back to the school that evening, and twilight had fallen on the dusky avenues and glades of Oakmount Park, Mr Bell presented himself very unexpectedly, at the gates, and seeing Miss Lamsett in the distance, walking with the two huge dogs for company's sake, he went to her. It was well for him that the dogs knew him, or their clumsy gambols of welcome might have been changed for an attack against which no man could have defended himself. Miss Lamsett smiled pleasantly when she saw who it was, and explained that she frequently walked in the park in the cool of the evening. 'Although the place is lonely, it is safe,' she said; 'and even if it were less so, my escort would be sufficient.'

Bell said a few words in reply, and then added, very abruptly: 'Miss Lamsett, I am here to-night to ask you a favour.'

'Indeed!' exclaimed Priscilla, and her colour changed, although the gloom of the evening hid it. 'I can promise beforehand that I, or my father, will be only too proud to grant it.'

'If any one will do it, it will be you, I know,' continued Bell; 'and in asking the boon, I am compelled to reveal my plans to you; but I know how truthful and discreet you are. I believe, Miss Lamsett, that I shall soon leave here, probably never to return; and I want you always to think well of me, if you can, and at any rate, when I am gone, always to speak well of me, or not at all.'

'Mr Bell!' ejaculated the young woman in amazement.

'Such a request sounds ridiculous,' resumed the usher; 'nor would I, for any inducement, make it to any one else. I have lived in many wild places, and endured many strange trials, until I have become hardened, and there is none in the world with whom to part would make my heart ache, or from whom I would rather receive a blessing than a curse—save your father and—yourself.'

'Oh, do not speak so wildly, sir,' remonstrated Priscilla; 'you wrong yourself and your nature. Why, if you were to go—which, I hope, is not to be—you would grieve to part even from little Alfred, who has grown to love you as he might have loved the father he has never known.'

'His case is very different,' said Bell, with a stern gravity: 'of him I say nothing. But in your little home, Miss Lamsett, I have always

been received with openness, with kindness, with sincerity. Over-rating every trifling service I could render you, forgetting all your own lavish returns, I see in you both, the kindly hearts which are as sure to encounter ingratitude and deceit, as water is to run down hill. If I were a younger man, and had a career before me; if I were more worthy'—He checked himself here, and they passed as he spoke into an opening where the roads crossed, and the moon, which had now risen, shewed Priscilla's face turned sadly to his own, and that her eyes were brimming with tears.

With a perceptible effort, she said: 'What you ask, we must do, Mr Bell, because we know it to be no favour whatever, but that it will always be our duty to speak of you in the highest terms. If you are going away, I shall of course keep your secret, as you desire it, but I shall feel that I am about to lose the best friend I ever had in my life; and when you speak of a person more worthy of the esteem of any one, man or woman, you speak of what I, and father, consider an impossibility.'

They turned on the homeward journey as she finished speaking, and walked in silence for some little time, save that Priscilla was sobbing, as Bell could distinguish, in spite of her efforts to subdue the sound. The usher naturally felt embarrassed; he had known for a long time that Priscilla was partial to him, that she regarded him as a second Admirable Crichton, for, in her solitary and uneventful life, he was probably the most gentle and accomplished visitor she had ever seen within the walls of the lodge; and he had been very guarded in his conduct, lest he should encourage this feeling to go too far. But he also liked the girl better than any one he knew; she had been always friendly to him, and now that he was about to part from her, probably for ever, he felt almost as much regret as did Priscilla herself. He thought, as he glanced sidelong at her, how well her trim dress, her carefully smoothed hair, her open candid face, would become his home, should he ever establish one, on the other side of the American continent. He felt, too, that she would go with him anywhere, and wait any time; and that, as she was not too young a woman, it would be difficult to find a partner so suitable to him. Nevertheless, he did not wish to involve her in the risks of his future life, and so he began what he at the outset only intended to be a little fuller explanation, carefully avoiding all mention of Alfred Rainwood. But Priscilla listened with so much sympathy, and spoke with a voice in which it was so very plain that her brave desire of encouraging Bell was struggling with her irrepressible sorrow at parting with him, that the explanation took a different form. Ere they reached the lodge he was her accepted suitor, and she had promised, betide what might, to go out to any country he should choose. In answer to his mention of her father, to whom Bell wished the engagement immediately to be made known, with a caution to keep it secret, Priscilla said: 'Fear no objection on his part, Mr Bell; he likes you better almost than his own sons; and, but that he could never bear the thought of dying out of view of Oakmount, I am sure he would come to you also. I pledge my word for him; and only trust for myself that I may prove worthy of the honour and happiness you have given me.'

This was a rather 'set' kind of speech, but poor

Priscilla's little learning was all derived from books, and not from intercourse with the world ; so, following the precedents which appeared to be common, she fully believed it was a very proper speech to make, and that a great honour had indeed been conferred upon her. She gave her lips frankly to be kissed when they parted at the park gates, and then hurrying into the lodge, she threw herself on her bed and wept for joy.

## MRS FLETCHER.

THE autobiography of this lady, recently published, offers no startling incidents, nor, indeed, much out of the ordinary run of domestic life ; but in her story, if we may call it so, there is the charm of truthfulness and simplicity, with revelations of high principle, and a remarkable vigour of character ; on which account, alone, the work would be worthy of commendation, independently of the interest derived from notices of political and literary characters in the early years of the present century.

Eliza Dawson--such being the maiden name of the authoress--was the daughter of a respectable yeoman at Oxtou, near Tadcaster, in Yorkshire, who farmed his own small estate, and was a man remarkable for his taste and intelligence. At her birth, in 1770, Eliza had the great misfortune to lose her mother, and was thrown on the affections of her father and other relations. A few years later, she received the kind attentions of her mother's early friend, Mrs Brudenell, whose history in itself was sufficiently sorrowful. As Miss Hebburn, and an heiress, she had the bad fortune to become acquainted with, and to marry the Rev. Edward Brudenell, who, from being an aide-de-camp in the army, entered the service of the church for the sake of a good living. Profligate, and devoid of proper principle, he soon rendered his wife miserable, and she felt constrained to leave him ; having for subsistence only a small allowance from what was substantially her own property. Sympathising with Mrs Brudenell in her unhappy fate, Mr Dawson let her have a cottage on his estate, and there, as a duty, she devoted herself to the elementary education of Eliza, cultivated her taste for poetry, and excited an interest in historical narratives. Improved under this friendly tuition, she was, at eleven years old, sent to rub off her rusticity, and acquire what are called accomplishments at a boarding-school at York. Eliza's reminiscences of this school-life are not agreeable. The management was a routine of despotism and dissimulation. Four volumes of the *Spectator* constituted the entire school library. From the strength of her good principles, Miss Dawson escaped the dangers incidental to this pretentious and wretched establishment.

Returning home, Eliza was, at sixteen years of age, indulged by her father with a trip to the Highlands of Scotland, in the course of which she visited a school friend, Mrs Mellis, in the neighbourhood of Perth. On how small a matter is a young lady's fate hinged ! A year afterwards, Mrs Mellis introduced to her Mr Archibald Fletcher, a practising Edinburgh lawyer, on his way through Yorkshire to London. Fletcher, a Highlander by birth, was a cadet of an old Argyllshire family, Fletcher of Dunans. At this time,

he was forty-three years of age--rather too advanced in life, one would say, to entertain the notion of marrying a girl of seventeen ; notions of this kind, however, are not always regulated by age. Mr Fletcher was mightily taken with Miss Dawson's acute intelligence and literary tastes ; while she was flattered by his attentions, more particularly by his sending her a gift of a handsome copy of Ossian's poems, and a letter inviting her remarks on the work. Next year, Mr Fletcher again paid a visit to Tadcaster. 'I do remember,' says Eliza, 'that when I received his note from the inn, saying that he would do himself the honour to call and spend the evening with us, I did resort to the toilette to curl my hair with rather more care than usual. I was more struck than ever with the good sense and good taste of his conversation, and much interested in his animated account of the splendid speeches he had heard at Westminster Hall, at the trial of Warren Hastings. My own mind had perhaps made some advance in knowledge and reflection, and I enjoyed this visit more than I had done before.' Matters were now in a fair way for a mutual attachment.

In 1789, Eliza again visited Mrs Mellis, near Perth, and thither Mr Fletcher shortly afterwards proceeded ; and then, she adds, 'the opportunity of conversing much together confirmed the attachment he had entertained for me from our first acquaintance in 1787, and converted the sentiments of respect and high esteem I had felt for him into those of a tenderer nature. I thought I had never met with a person of such real elevation of mind, and such independence and worth of character ; and a happy union of thirty-seven years as his wife served to confirm me in that opinion. It was agreed that he should come to Harrogate in the autumn of that year, and thence to pay us a visit, when he had my permission to make his wishes known to my father.' Proposals were accordingly made, but rejected. The father 'had formed splendid expectations for the child, on whom he doted. He could not think of parting with me to such a distance. He could not think of my marrying a man altogether without fortune, and where there was so great a disparity of years.' Eliza considered the objections to be sound and rational, yet she did not give up Fletcher, corresponded with him, and hoped still to be his wife. Her admirer was not without sentiment. He nourished the fancy that in appearance, manners, and character, she bore a resemblance to Sophia in Fielding's *Tom Jones*, and he began to call her by that name in his correspondence. It was clear the marriage could not be indefinitely postponed. It took place on the 16th July 1791 ; the father offering no further obstacle, yet not giving his consent, nor honouring the ceremony with his presence.

Removing to Edinburgh, a new life opens on Eliza, now Mrs Fletcher. She is introduced to men of talent and literature, and to many women of rank and fashion. Soon, however, she discovered that her husband was somewhat looked down upon on account of his political principles, and that she came in for a share of the obloquy. Archibald Fletcher, to whose nobleness of character Brougham and Cockburn have referred, had been an ardent admirer of the first principles of the French Revolution. Like many others, he imagined that there was about to dawn an era of civil liberty and social perfectibility. The horrors

of the Reign of Terror disenchanted general expectations of this nature, but there were lingering hopes that matters would speedily rectify. Mrs Fletcher, with political leanings similar to those of her husband, speaks of the prodigious advantage likely to ensue from the breaking up of large properties and the compulsory division of heritage among children in France. How fallacious were such notions! Living more than eighty years after the event, we know that the minute division of lands in France has reduced the country to a nation of ignorant peasant proprietors, who are biassed and guided by political adventurers and demagogues; so that healthy political action becomes an impossibility. The Fletchers, of course, did not foresee either this or the rise of an intermediate despotism under Napoleon, and they, perhaps, expressed themselves too freely on the possible benefits of the revolution. At all events, they were kept at a distance by many who would otherwise have befriended them; in point of fact, Archibald Fletcher's professional prospects were injured, though he continued to be generally esteemed for his upright conduct.

It was a great happiness to Mrs Fletcher to be visited by her father in 1792, and her happiness was increased the same year by the birth of her eldest son, Miles Angus Fletcher. This was the beginning of a flow of pleasant circumstances. 'In the spring of 1794, my father made us a present of an excellent house in Queen Street, No. 20, and came down himself in the summer with my aunt and Mrs Brudenell to spend a month or two with us. His little grandson, Miles, was now able to talk to him, and such was his delight in looking on this child that I could not find in my heart to refuse his request to take him along with them when they left us. . . . My father saw me surrounded with many blessings. . . . He saw that I had confided my happiness to one most deserving.' We pass over notices of the births of several other children, and also the distress caused by the death of Mr Dawson in 1798. Family prospects, however, begin to look up. A cottage at Morningside is taken for summer quarters. Here Mrs Fletcher is visited by an old friend, Mrs Millar, who had gone to America with her husband to escape political turmoil. The cure proved worse than the disease. Millar died, and his wife returned to Scotland with all her prospects clouded. 'She interested us much by her animated and graphic descriptions of America, and of men and manners in the United States. She had often seen and conversed with the greatest man of his age—General Washington, Philadelphia being then the seat of the Federal government. She described his demeanour as calm, mild, and dignified, and his domestic character as excellent.' In the spring of 1801, Mrs Fletcher accompanied her husband to London, her first visit to the metropolis. Here she becomes acquainted with Mrs Barbauld and the gifted Joanna Baillie at Hampstead. Speaking of Joanna, she says: 'I found her on a Sunday morning reading the Bible to her mother, a very aged lady, who was quite blind. Joanna's manners and accent were very Scottish, very kind, simple, and unaffected, but less frank than those of her elder sister. She seemed almost studiously to avoid literary conversation, but spoke with much interest of old Scotch friends and of her early days in Scotland. I was much interested

in her, having but a short time before read her *Plays on the Passions* with deep interest. . . . With the brilliancy and power of Mrs Barbauld's conversational talents my husband and I were greatly delighted. She took the same views that we did on public affairs, and had felt deeply, as we had done, disappointment in the disastrous turn of the French Revolution. . . . Mr Fletcher had at this time some interviews with his political friend, Mr Sheridan, whom, however, I did not see.'

Back to Edinburgh to look after her children, and to send her oldest boy to the High School, Mrs Fletcher touches a point in literary history. 'The latter part of the year 1802 was interesting to us in a public way by the commencement of the *Edinburgh Review*. We were fortunate enough to be acquainted more or less intimately with several of the earliest contributors—Brougham, Mr Jeffrey, Dr John Thomson, Mr John Allen, Francis Horner, and James Grahame, the author of *The Sabbath*. James Grahame was a much valued friend. He united to a highly refined and cultivated taste much general information, a very sincere and elevated piety, and the greatest simplicity of manners. I, who knew Edinburgh both before and after the appearance of the *Edinburgh Review*, can bear witness to the electrical effects of its publication on the public mind, and to the large and good results, in a political sense, that followed the circulation. The authorship of the different articles was discussed at every dinner-table; and I recollect a table-talk occurrence at our house which must have belonged to this year. Mr Fletcher, though not himself given to scientific inquiry or interests, had been so much struck with the logical and general ability displayed in an article of the young *Review* on Professor Black's Chemistry, that, in the midst of a few guests, of whom Henry Brougham was one, he expressed an opinion (while in ignorance as to the authorship) to the effect that the man who wrote that article might do or be anything he pleased. Mr Brougham, who was seated near me at table, stretched eagerly forward and said: "What, Mr Fletcher, be anything? May he be Lord Chancellor?" On which my husband repeated his words with emphasis: "Yes, Lord Chancellor, or anything he desires." This opinion seems to confirm Lord Cockburn's words concerning young Henry Brougham of the Speculative Society, that he even then "scented his quarry from afar."

We have next a somewhat droll anecdote of the gentle James Grahame, the poet of *The Sabbath*. Mrs Fletcher says he 'was so susceptible of the tender passion that he fell in love at first sight with a young lady whom he saw first ringing at our door, then No. 20 Queen Street. He came in a little afterwards, and asked me many questions about the dark-eyed beauty, who, he said, had thrown the "glamour over him." I invited him to meet her; she completed her conquest, and at the end of two months they were married.' About this time she began a friendly intimacy with Thomas Campbell, author of the *Pleasures of Hope*, adding: 'Life at this time glided on with us calmly and satisfactorily. My husband's professional emoluments, though very moderate, were amply sufficient for us, combined with my inheritance from my father's property, which was left to me in life, and was entailed on our children. We had no vanity to lead us into expense, our circle of acquaintance

was very limited, consisting chiefly of old professional friends of Mr Fletcher, their wives, and families—with occasional gleams of more literary and distinguished persons. Of these, was the Hon. Henry Erskine, whose wit, and whose graces of mind and manners, placed him at the head of good society in Edinburgh.' Her course of domestic life is thus described, and we may take it as that of a model wife and mother: 'I do not remember to have had any stirrings of worldly vanity or ambition. My delight in feeling that my sympathy in my husband's public feelings contributed much to his happiness, and my just pride in the lofty integrity of his character, and the affectionate kindness of his heart towards me and our children, formed my happiness. These children, too, were my "mirth and matter;" I was wrapped up in them; and though I never could command the patience that qualified me to be their teacher, I delighted in making them my happy and confidential companions.'

In 1804, it was a relief to learn that Mrs Brudenell had been relieved of the unworthy husband who had been the blight of her existence. Thankful to be rid of him, she put on no mourning, affected no grief. 'By his death, she became possessed of her hereditary estate of Hebburn, in Northumberland; and at her earnest desire, Mr Fletcher and I accompanied her to take possession of it. I think one of the most melancholy days of my life was that on which I accompanied this once gay and light-hearted woman to the hills and ruined castle of her ancestors. She who in youth had bounded over those fields the heiress of a fair domain, full of life, hope, and promise, now, at the age of sixty-six, came back a shattered, feeble old woman—without strength or spirits to enjoy the goods of fortune. She felt this incapacity of enjoyment with an intensity proportioned to the exquisite pleasure she would have had in being able to exercise hospitality, and to spread cheerfulness around her.' Such is the touching account of a life wrecked by an unfortunate marriage.

For the summer of 1810, the Fletchers occupied the pleasant country-house of Frankfield, about a mile above Lasswade. Here they met some interesting strangers. One evening, after Mrs Fletcher and her daughters had been weeping over the last chapter of *Clarissa Harlowe*, and could think and speak of nothing else, she says: 'We were sauntering about on a bank above the Esk, called the Whinny, when who should we meet but Professor Playfair, his then pupil Lord John Russell, Mrs Apreece, afterwards Lady Davy, and Miss Hannah Mackenzie (a daughter of the "Man of Feeling," Henry Mackenzie). This very agreeable party returned with us to drink tea to Frankfield, helping us to forget the creations of Richardson's genius in the sparkling vivacity of Mrs Apreece, and the taste and refinement of her companions.' In the autobiography there occur a number of agreeable snatches of this kind.

The authoress remarks that about 1812, a change for the better came over the social meetings in Edinburgh. 'Large dinner-parties were less frequent, and supper-parties—I mean hot suppers—were generally discarded. In their place came large evening-parties, where card-playing generally gave place to music or conversation. The company met at nine, and parted at twelve o'clock.

Tea and coffee were handed about at nine, and the guests sat down to some light cold refreshments later on in the evening; people did not in these parties meet to eat, but to talk and listen. There you would see a group (chiefly of ladies) listening to the brilliant talk of Mr Jeffrey; in a different part of the room, perhaps, another circle, amongst whom were pale-faced, reverential-looking students, lending their ears to the playful imaginative discussions of Dr Brown, while Professor Playfair would sometimes throw in an ingenious or quiet remark, that gave fresh animation to the discourse. On other occasions, old Mr Mackenzie would enliven the conversation with anecdotes of men and manners gone by.' We may contrast this rational and inexpensive method of spending the evenings, with what now prevails—ceremonious, heavy, and costly dinners, lasting from seven till ten o'clock, and devoid of any general intellectual converse; the whole thing usually a piece of show, which leaves no pleasing recollection, and is valueless for social intercourse.

Years pass on, and we are feelingly told by Mrs Fletcher of family bereavements, the first loss being that of Grace, the eldest daughter; the second, that of her husband, in 1828; and the next, that of Miles, her eldest son, in 1831. In the latter part of the autobiography, we are introduced to a number of literary personages, all of whom have latterly passed away. Not the least interesting portions of the work are the letters to and from intimate friends of the family. These letters, along with various notes, have been embodied in the text by Mrs Fletcher's daughter, Mary, Lady Richardson, wife of the arctic voyager. To her, as editress, the world may be said to be indebted for this very delightful book, which we commend for perusal to all who relish records of domestic affection and elevated principle.\* Mrs Fletcher's life was drawn out beyond the span of ordinary existence, and though enduring some sorrows, she had the pleasure of enjoying many blessings, not the least of these being the advancement in life and happiness of her grandchildren. She died from exhaustion of nature, without any bodily pain, and in a gentle sleep, on the morning of the 5th February 1858, having then entered on her eighty-ninth year.

#### A TRIP BY RAIL IN THE TROPICS.

'HERE, mister; the colonel sent this to you and your friends with his compliments.'

It was an order for free transit for self and party to cross the Isthmus of Panama per rail. A most agreeable compliment too; for five pounds, the fare for a journey of forty-seven miles, was too heavy a sum to be thought of for a pleasure excursion.

'And I guess,' added the messenger, 'you'll have to be peart sharp, for she starts at five to the exact instant.'

Arrived at the station, and having presented our authority, and shaken hands with every official, from the guard to the porter, wearing a white skin, we take our seats in an empty van, the guard kindly placing chairs for us, and supplying us with cigars and his company. The town of Colon, or Aspinwall, or Navy Bay, for it rejoices in a

\* *Autobiography of Mrs Fletcher*. Edited by the Survivor of the Family. Edinburgh: Edmonston & Douglas. 1875.

variety of nomenclature, was our point of departure. How we got away without destruction to human life, is one of the things that remain unanswered, for the line runs through the only street which constitutes the town, close to the houses; and as every house is an hotel, and every hotel crowded both within and without; and as human beings black and white, mixed with dogs, pigs, and turkey buzzards, crossed the rails in every direction—it still remains a mystery how we cleared the town without accident. However, we did so, without even touching a feather of a crowd of turkey buzzards that are holding high carnival. Talking of turkey buzzards, these birds flourish wherever garbage exists, floating almost motionless at an immense altitude in the clear blue tropical sky. They detect carrion from afar by their keen powers of vision, and a dead horse or ox is soon a seething mass of fowls, eating until gorged, when they lazily hop away, to make room for fresh arrivals.

The first portion of the rail to Panama runs through a deep mangrove swamp; heavy and green, the tangled roots and branches swarm over the poisonous waters, which ever exhale the death-bearing malaria; here and there the mangroves leave open spaces, which are greedily seized upon by gigantic reeds and rushes, netted and intertwined by water-lilies. At intervals, mighty trees, loadless, black, and gnarled, stand alone, shewing the pestiferous effects of the swamp; but these are not unadorned; from every bough hang ferns and orchids of various and beautiful growth; conspicuous among the latter is the Santo-spirito, with its down-like pistil and stamens. The dangers attending the laying out of this railway were so great that it required no great stretch of imagination to comprehend the statement, that every 'sleeper' on that part of the line at all events, cost a human life!

Hérons, bitterns, and wild-ducks find a home here, not to speak of water-lizards, snakes, and alligators. Onward we speed, now through swamp, now through ancient forest, where the gigantic silk-cotton tree spreads its magnificent branches to the sky, yet seems almost swallowed up by parasites, which in festoons hang from its boughs, or writhe like snakes round the stem. Clouds of parrots and parrakeets fly across us, screaming most inharmoniously, drowning the sound of the steam-trumpet, as it announces our arrival at Monkey Hill Station. Here we stop to take in water, for all the water for Colon must be brought from Monkey Hill. On again through the tropical forest. Our next station was Lion Hill, called so, probably, because there are no lions there. However, as far as roaring is concerned, the absence of the king of beasts is immaterial, for the Howling Monkey (*Myiotes ursinus*) keeps up a continual concert in the woods. The stranger is indeed at first startled by the sound, as, from its depth and loudness, the cry very much resembles that of the larger carnivora.

The kindly offer of the station-master to take us in charge for the day and shew us some of the wonders of the forest, determined us to remain, and go on by the afternoon train. Our host turned out to be a Scotchman; his speech betrayed him at once, for the pleasant north-country accent still hung on his tongue, though his expressions, from some years of absence from his native hills, were not in every instance Doric. With him we got on

famously, and ere we parted, we were on the most familiar terms. A great collector of natural history specimens was Mac—not, indeed, that he knew much about them, but then they were worth so many dollars to non-scientific collectors. How he had pitched here with his wife and comely daughter, I know not. Whether it was that auld lang syne affected the maiden's heart, or the sight of a young man (for dried-up Yankees were her only acquaintances) was pleasant to her sight, it is not for this historian to say; but whatever the cause, through Jenny I obtained from her father some rare specimens, chief amongst which was the King Fly-catcher (*Muscivora Mexicana*).

A hurried luncheon of salt-fish and bananas, and gun in hand, we sallied out into the sombre forest. Flocks of black 'witches' (*Crotophaga*) accompanied us on our way; green parrots screeched in every direction; trogons whistled softly in the shade; golden orioles popped in and out of their nests, which hung like purses from the tips of the branches; the magnificent scarlet woodpecker hammered away, recalling to mind Mr Moule and Mrs Gamp. Deep in the forest roared the howling monkeys. And such a forest! Trees, the lowermost branches of which surpassed in size the trunks of our largest elms; and so dense their foliage, that in places the gloom approached to darkness. Underneath, flourished the cactus and aloe, presenting an absolutely impenetrable barrier to the wanderer, except where the deer or other wild animal had wound through.

Ninety degrees in the shade soon becomes intolerable even to the most enthusiastic of wild Nature's worshippers, especially when the mid-day siesta has become a habit; even the birds retire at noon, and silence falls on the forest for the next three or four hours. In the middle of the forest is a solitary dwelling, inhabited by a solitary personage whom Mac knew, and by whom we were introduced. He welcomed us to his abode and invited us to the hospitality it afforded. After our forest-rambling, it was pleasant to lounge in the cool verandah, jalousied, to admit the air without the sun. Cigars, coffee, and American rocking-chairs added to the comfort.

'Would any one like a hammock?' asked our host. Yes, one of us would. A grass hammock was accordingly fetched, and about to be slung, when out sprung a small snake, and glided away.

'Nesty vermin; I hate them,' said Mac. 'I always shudder at them, since an adventure I had this very time last year.'

'An adventure; what was it?' from everybody.

'Weel,' returned our Scotch host (warming up at the recollection of something, and giving free play to many Scotticisms, the greater number of which I now forget), 'I call it an adventure at anyrate. Ye see, I had been out all the morning with the gun—Jenny minding the signals, and as I was returning, I stopped down bye at the brook to have a dip. The day was melting. The path to it was shady, and runs through a grove of mango bushes, and being fond o' the fruit, I was looking for it wherever I saw a likely tree. Weel, I picked and ate, and better picked and ate, till I could eat no longer, and had just pulled the last, when what should dart down from the tree, full at my face, but one of these nesty black constructors. Luckily I put up my right hand and caught him by the neck before he had time to

bite. I knew the vermin weel, and had shot plenty o' them, and to tell the real truth, their hug's waur than their bite, for they don't belong to the poisonous kind. But they are fashious enough for all that, for if they come to close grips, it takes a pretty stout chiel to untwist them.' Here our worthy host paused to refresh, a few moments being allowed for the operation.

'Weel, ye see, I was telling ye about the constructor,' continued Mac (persisting in the *u*), 'and mind ye, what I'm telling is a true bill.'

'Proceed, Mac; we're all attention.'

'Weel, as I had the vermin safe by the neck, I didna fash myself very much, beyond wonderin' whether I would kill him or take him home alive. Mind ye, all the time he was dabbin' an' dabbin' at me, wi' that forked tongue o' his glintin' in and out o' his ugly mouth, like the telegraph needles. Kill him, thinks I. But first to swing him off, for by this time he had the grip, and wasna like to yield. I soon found that there were twa to that game. Try as I might, my gentleman would not budge an inch. I tried my full strength, but na. I cried to Jenny to fetch something, for I was not far off the station, but she never heard. I was beginning not to like the way things were going, for the beast was grippin' aye the closer, and the arm that held him was getting tired. Besides, the grip was round the other arm, which I could only move below the elbow. The beast was coiled over my left shoulder, then round under my right arm, and then across my waist, binding, as I've told ye, my left arm. If once I let go, I knew he would strangle me, and to tell the truth, I could not hold out much longer. I always carried a knife, which I knew was in the pocket of the flannel shirt I was wearing, and my only chance lay in getting at it. I could just reach it by bending my left arm, and I daurna let go the right. And as I fumb'l't and fumb'l't it gave me a terrible turn to find that the vermin had steekit my pocket as firm as if it had been sewn up. That made me grue.'

'Excuse me a moment, Mac,' interrupted I. 'What do you mean by "steekit"?''

'Steekit? Weel, I fancy it's the plain English for shut, or maybe closed.'

'Thank you, Mac; your northern English is capital. But there was another—let me see'—

'What? "Made me grue"?''

'Ah, that's it—"made me grew." What's "grew"?''

'Were ye ever in an ugly fix and didn't know how to get out of it?' returned Mac, characteristically.

'Many a time,' I replied; 'and indeed such a fix as the one you are describing would have made my flesh creep.'

'That's it,' cried Mac; 'it would have made ye grue.—Weel, I was just comin' to the bit, when the gentleman interrupted me. My right wrist was getting weaker and weaker with holding the snake, and faith, the constructor knew it as he girmed and hissed at me, and darted fire out o' these ugly een o' his. I was sair left to mysel. Thinks I: "Mac, ye've got your match at last." I didna care so much for my chest, for all his cuddlin'; but my throat, once around that, and I would have said: "Mac, ye're a deal man!" All this time, the vermin was trying to get to my throat, and as I found him winding up, the perspiration broke over

me. What was to become o' the wife and Jenny—and me awa? That was an anxious thocht to me at the time. Weel, just as my gentleman was working for my throat wi' his coils, he gave my pocket the slip, and left it free. I felt my arm growing strong again. "Feel for the knife now, Mac," says I to myself, and in two cracks it was in my hand. Then bending my head to meet my hand—I know the brute thocht I was done—I unclasped the gully with my teeth, and in an instant after, it was slipped in between him and my body, with the edge turned out.'

'Just in time, Mac,' said I, 'for I think the snake was having the best of it.'

'Ay, ye're richt there, sir; but if I got a fright, yon constructor got anither, for in a jiffie I had him in two halves! I must have got an unco fleg; and the last thing I mind, was something going off like a paper poke. When I came to out o' my dwam—for I had fainted richt off—the vermin was bye with it—past any more capers—and Jenny says to this day, I may be thankfu' the beast didna slang me.—But now, gentlemen, it's time we were moving towards the station, if you wish to catch the next train.'

So, after thanking our solitary host and bidding him adieu, we wound our way back again to the railway, and just as the train was moving off, with us cosily seated in the van, Mac whispered: 'If ever ye're in Tillicoultry, just speer for'—

But what followed was drowned by noise, and so we left Mac and his wife and comely daughter, and proceeded on our way.

Paraiso Station, the last on the line, was our destination, where we were to stop for the night. The sun had sunk behind the hills when we reached it; and after coffee and the everlasting bananas, we 'fixed' ourselves as best we might for rest and sleep. Daybreak found us fresh and ready for our start up the mountains. A small hand-cart, worked by four negroes, awaited us on the rails outside, and whilst the gloom of night still clung to valley and hill, we set out, bowling along at a good twelve miles an hour. Paraiso Station is on the decline towards Panama, to which we turned our backs, and a few minutes brought us to the highest part of the line; here a little mountain stream divided into two streamlets, one winding its way to be lost in the broad Atlantic, the other coursing in the opposite direction, to add its mite to the waters of the Pacific. Troops of deer, tempted by the young grass along the line, dashed into the bush as we rattled by. A three-toed sloth obstructed our path for a moment, but was quickly accommodated with a seat in our car—doubtless, he never travelled so fast in his life before. The sun was just gilding the tops of the forest when we stopped our rapid journey, and leaving the slender track of civilisation behind, we plunged into the bush. Hot and fatiguing was our toil through bush and forest; through deep ravines, where the sun's rays never pierced; round the crests of cliffs all covered with the most luxuriant vegetation, as we breasted the mighty range of the Cordilleras.

It was with a sense of considerable relief that we completed our walk at noon, and lay down to rest under the pleasant shade of a banana leaf-roof. We were now in a clearing in the great primeval forest: a mountain-stream gurgled its tortuous way at our feet, limpid pure water, running over

golden sands; and under the influence of 'yellow fever,' this clearing had been made. Unfortunately for the prospectors, though gold did undeniably exist, there was too little of it, and the place was deserted—a couple of vagrant negroes taking up their residence in the neglected sheds. It was something new to us to wash for gold; so, after a short rest, we got the negroes and the washing apparatus into the stream; but even gold at the rate of sixpence-worth in the hour is not remunerative, so a couple of hours under a broiling sun satisfied our curiosity.

There is something very solemn in the night stillness of the tropics. As evening falls, the forest sounds change with the hour; the shrieking of the parrots is exchanged for the monotonous chirping of the tree-crickets, or the melancholy hoot of the owl; and the wail of the goat-suckers is followed by the howling of the ocelot. All the strange sounds seem to make more weirdly the weird stillness. Sleep was impossible. The strangeness of scene, for, in the clear starlight, the surrounding forest was visible like a black fortress on every side; the eerie sounds; and last, but not least, the mosquitoes. If ever there existed an item created for no conceivable object, the mosquito surely is one. With no protection other than some rails to keep out midnight visitors, they besieged us in thousands, their horrid ping-ping being almost as annoying as their bite. What seems most curious about these torments is, that they are to be found far away from the haunts of any animal on which they could possibly feed, yet they pounce upon the first unfortunate visitor as if his blood were their daily accustomed rations. What curious instinct guides them? and what did they live on previously?

The gur-gur of the wild turkey was a delightful salutation as the day broke; and we started early on our return journey, in order to do some shooting; but little else than the sound was our reward for tearing through the cruel under-wood; and on our arrival at the station, our bag consisted of one hen-turkey, a Curaçao bird, a couple of brace of partridge, a toucan, and two squirrels. As to our clothes, the greater portion was left in small fragments on the cactus and wait-a-bit thorns; in fact, every growing thing in the tropics appears to have thorns—from the aloe, with spears to every leaf, down to the tiny creeping mimosa, which closes its leaves at the very tread of the pedestrian.

Back again to the town (for Colon is called a town) of hotels and aroma, convoyed by our friend the guard, who shakes hands with us, as if years of intimate friendship had existed. I must not forget, however, the very last of our Scotch friend at Lion Hill, as the train stopped for a few moments at that station on its return journey.

'Well, Mac, here we are again, you see.'

'Ay, gentlemen, and a good journey to you; and as I was saying to ye, if ever ye happen to be at Tillicoultry—just ask for—Angus Macfarlane.'

Colon at last.

'Have a liquor, guard?'

'Wal, I calc'late I could hide a drain.'

'Tall or short?'

'Now, mister, I guess I have a thirst on me that I wouldn't sell for five dollars.'

So the barman having brewed a tall sangaree for

the guard, and a short cocktail for the rest of us all round, we shake hands again most affectionately, and return to our tubs and civilisation on board our ship, which was now getting up steam, and in an hour hence would be ploughing the deep waters of the Spanish Main.

#### DARLING DOREL.

[Dorothea Sibylla, daughter of John George, Margrave and Elector of Brandenburg, married John, Duke of Brieg, in 1610. She is described as a pattern of goodness, common-sense, virtue, and piety, and on account of her kind and genial ways was universally beloved. Children were her especial delight, and whenever she passed through the town of Brieg, they would welcome with infinite zest their bountiful benefactress. The following verses shew how the Duchess of Brieg came to be called the *Darling Dorel*.]

She came with her innocent beauty and grace,  
An angel in heart and an angel in face,  
As quaintly the old German chronicles tell  
The picturesque story of Darling Dorel.

Some faces are bright like the sunbeam of day,  
Wherever they shine the clouds vanish away,  
While Sorrow's pale phantom glides back to its cell;  
And such was the face of the Darling Dorel.

Some hearts are so full of the treasures of love,  
The beautiful gifts of the Giver above,  
Their riches overflow into others as well;  
And such was the heart of the Darling Dorel.

Some lives are like chords under music's control,  
Each incident harmony blends with the whole,  
Until on the ear in full concord they swell;  
And such was the life of the Darling Dorel.

Whenever she passed through the streets of the town,  
No story-book queen with a sceptre and crown,  
But gifted with graces that none could excel,  
The natural guards of the Darling Dorel,

Her ladies would bring with them comfits and toys  
For the bright little maidens and brave little boys,  
While the children would follow love's magical spell,  
And hasten to welcome their Darling Dorel.

The Duchess knew not of her pretty new name,  
Though far it was spread by the heralds of fame,  
Till at length, as it happened, one day it befell  
That she learned they called her the Darling Dorel.

'Twas breathed by a child's yet impolitic lips,  
Which often the wisdom of sages eclipse;  
The Princess had asked if her name she could tell;  
'Your name,' said the child, 'is the Darling Dorel.'

The courtiers all stared, half in wonder, half sport;  
Such a name savoured more of the cot than the court,  
But their mistress said, smiling through tears: 'It is well;

Henceforth let them call me the Darling Dorel.

'The proudest of titles that monarchs can shew  
Are those which the love of their people bestow;  
And not for an emperor's crown would I sell  
The title mine give me of Darling Dorel.'

## ADVENTURE ON THE APPIAN WAY.

It was a lovely bright morning when we, consisting of a party of four ladies, drove out of the Piazza di Spagna at Rome on an excursion to see the famous ancient tombs on the Appian Way. The driver of the vehicle, a native of Rome, was well acquainted with the route; and as for guides, we were provided with Bædeker and Murray. Rolling gaily along, we pass the ruins of the Roman Forum, and the majestic remains of the Colosseum. We were now outside the city, and almost immediately on the ancient paved way, on each side of which, at irregular intervals, stood memorials of long past times.

Onward we sped. To our right lay the long flat plains of the Campagna, lost in the distance, and only bounded by the sea. As we proceeded, our driver became more and more taciturn. He appeared reluctant to give us any information, and reminded us that we had only to consult our books. One word, however, had impressed itself on his memory; he told us we should soon see the 'Corrasce.' What that was, we could not tell. Presently, to our right rose two great circular mounds. Here was the Corrasce. How stupid, we all exclaimed, not to remember the graves of the Horatii and Curatii. In a moment we were out of the carriage, and gaining the top of the grassy mounds, had an extensive view, which, in the distance, included the dome of St Peter's. Wandering about amongst the curious old tombs, and enjoying the loveliness of the day and picturesque grandeur of the scenery, we at length found that it was time to return. Our coachman must have come to the same conclusion, for he has turned the horses' heads, and precedes us a little way on the road. We come up in a few minutes with the carriage, and resume our seats. One of the party remembers she has heard of beautiful pieces of marble to be found here; so we again descended to search, but the smaller pieces had all disappeared. Twice we renewed our researches, only regretting our time did not permit us to scramble

among the remains on each side, and finally we re-entered the vehicle for our return home.

We had passed the twin mounds of the warlike brothers, careless and contented, congratulating ourselves upon our expedition, when in an instant, with the quickness of a dream, up start two men from some ruins beyond the road. No noble Romans these—evil Italian men intent on robbery, perhaps murder. In a moment a pistol is pointed at the horses' heads, and the driver ordered to descend; another second, they are at the carriage. I try, but in vain, to recall the sensations of that moment—astonishment, stupefaction, incredulity, terror, succeeded each other as rapidly as I write the words; then, worst of all, the full realisation of the truth, that we were helpless and utterly alone, in the power of these villains. A glance around—not a living soul; another at our valiant coachman—there he stood, rigid, apparently paralysed with fear, his face livid: no hope of a rescue. As already mentioned, we were four in all—three of us natives of Great Britain, and one a Canadian. The Canadian, an English friend, and myself, sat in the carriage. K——, for the sake of the view, had mounted the box, and sat perched beside the coachman. She saw them as they sprang on the road, weapons in hand, and whispered down to me the one word—'Brigands.' Two fierce, dark faces; a pistol, with gleams of silver; a long knife, slightly bent, clean and shining. Ah! The view down the barrel of that pistol, and the gleam of the knife. How they shine in the sun!

'Scendete!' they shout, throwing open the door of the carriage—('Descend'). A moment before, I had felt the carriage as a prison, now it seemed a home; and with one accord we clung to it. An instant more, and they were upon us. 'Danaro! danaro!' they shouted—('Your money or your lives!') A dark-bearded man seized the Canadian, his accomplice sprang on the lady sitting beside her, and the struggle commenced. Good heavens! can it be real? The carriage seems to swarm with them, they are so quick and resolute. The first attacked gave up watch, chain, ornaments, her purse: 'Take it, take

everything; give them everything,' she cries imploringly. Not so with the second. Till now silent, spellbound, we seemed to have lost the power of speech; but suddenly shriek after shriek rent the air. She stood, and fought bravely with the robber. He had a small unbearded face, with bent brows, and resolute, tightly shut lips. The contest was not long; the knife gleamed across her throat, her dress and jacket were wrenched open, blood dripping down fast. 'Help! help! she will be murdered!' She is thrown down; her watch-chain, her ornaments, the little charms we had been looking at the evening before, hearts, medallions, the little souvenir of the Atlantic cable, have all changed owners, and disappear in a twinkling among his garments.

All this is the work of a moment; in another, life and power of movement come upon me with a rush. My turn comes next. One great spring and I am out on the road; an instant, and a brigand from behind, who had probably guarded the carriage, is at my throat. Just as I have often felt in the agonies of a dream, not a sound would come from my lips, but in silence I struggled with the villain; the knife was close to my eyes, but I feared it not; I forgot all in the intense desire to save the gifts and memorials of a dear lost mother. A quick silent struggle, a sight of K—, who, with loud outcries for help, threw herself fearlessly on him behind, and vainly endeavoured to pull him off. Snap, snap! My chain has changed owners; but I still held, I thought, well concealed in my hand, a locket torn off the chain. Down came the knife; it just grazed my glove; he wrenched open my hand, and in another moment we were alone. How it had come, I know not, but the carriage was now empty, and we were all on the road.

Tokens of the hurricane which had passed by lay scattered about—a small white parasol, a torn glove covered with blood; Bredeker and Murray had fallen by the side of gathered flowers, shawls, ribbons. In, into the carriage; up, for our lives; perhaps there may be others. We huddle into the carriage; but our coachman, where was he? What had he done? There he stood, that valorous man, alone in his glory, stout, firm, stony. The strife of the last few minutes had not aroused one thought of defence, or help to the defenceless. Discretion certainly is the better part of valour. 'He that fights and runs away,' I had thought the motto of a coward; but that man had neither fought nor run away. It was not worth his while to fight; and as to running away—well, the day was hot.

In we went. 'Now, cocchiere, drive on, drive on subito a Roma. On, on, per l'amor di Dio!' Still he stands unheeding, till at last, probably convinced it could be no affront now to the brigands, he gathered up the reins, and set off at a leisurely pace. Not till now had we remembered that one of our number was wounded in the neck, and that the blood was flowing fast. We were

bandaging the wounds as well as we could, when, a savage shout, a sudden pull-up, and, to our horror and intense fright, again those dreadful men. In an instant they were in the carriage, and from our poor companion, who lay back pale and bleeding, they wrenched away her earrings, which they had previously overlooked, and descending as suddenly as they came, disappeared. Oh, the terror of that moment, not knowing what caprice might induce them even again to return, defenceless as they knew we were! By this time our shawls, gloves, dresses, all bore the crimson stains of the late affray. We tried in vain to stanch the blood; when, to our great joy, we heard the sound of wheels, and soon a carriage came in sight, coming from Rome—its occupants only ladies, it is true, but how thankful we felt for the addition to our numbers. To their affrighted inquiries of what had happened, one word was enough—'Brigands.' Their coachman turned his horses in a panic; but the ladies jumping out, came running towards us to know if they could do anything for us. But without a moment's loss of time we set off for the city, they following.

A few minutes later, we met four gentlemen, travellers, also coming for a day's amusement on the Appian Way. Startled by our strange appearance, they came hurrying to us with offers of service. They were Austrians, come to pay a visit to Rome and its environs. They were most kind. One of them proved to be a doctor, and proceeded to bind up the wound. Levying contributions on the handkerchiefs of the new-comers, he soon made bandages, &c., and all apprehensions on that score were allayed for the time. We now mustered three carriages, with their occupants, besides the Austrian gentlemen on foot. Carriage after carriage we met as we drove towards the city, and as the gentleman inside with us, and the other, who sat beside the coachman, called to them the one word 'Banditti,' it was curious to observe the change which passed over the various occupants. So secure felt some, that, staring at us, they drove quickly by, evidently under the impression that 'the people in that carriage needn't try that joke;' but driving on a few paces, they would think better of it, and turn. Another party thanked us eagerly, and proffered all kinds of service. But most obstinate of all was a carriage with one lady for its occupant: she looked coolly at us a moment, put up her double eyeglass, and probably thinking we might be escaped lunatics, desired the man to drive on. On she went, to our great concern, remembering the men who must be close at hand, fresh from their successful forage, and with those dreadful knives; but, to our great pleasure, in a few moments lady and carriage reappeared. She had evidently thought it twice over, and probably it was well for her she had done so.

As we came towards Rome, our improvised procession added carriage after carriage to its length, till we headed a long file of vehicles, tourists on foot, horsemen, people of many nations and tongues. Once inside the walls, we felt safe; our spirits rose; and on arriving at our hotel, we received with suitable dignity all congratulations on our 'brilliant courage.' After all the dangers we had suffered, had we not returned with a story to tell!

[We see by the newspapers that the brigands

who committed the outrage above narrated have been caught. Whether, in the lax administration of justice in Italy, they will suffer any punishment adequate to their offence, is a different matter.—Ed.]

### SWANS.

ON account of their supposed destruction of fish, there is at present a great raid against the swans on the Thames. It is alleged that they have increased to an extent which deducts considerably from the picturesque Wordsworthian ideal of the swan that 'floats double—swan and shadow;' that they should be seen in ones or twos, but certainly not in swarms. Mrs S. C. Hall, in the *Book of the Thames*, says, with pardonable enthusiasm, 'we would almost as soon part with the trees which border, as with the swans that grace the surface of our noble river.' They certainly tend to keep down the too great exuberance of aquatic weeds which, with the coarse grass which grows luxuriantly at the water-side, form their salad. But they are accused of rendering their vegetable diet the more palatable by an admixture of fish-spawn, particularly that of perch, which, being suspended on the branches of submerged willows in convenient festoons, is looked upon by the bird of Leda as being purposely placed there for its especial enjoyment. It has been pleaded by some that this lubricating luxury is necessary for the proper assimilation of its food; but the opponents of this doctrine have examined the internal economy of the bird to prove that it possesses a gizzard of such a wondrously grinding power as to admit of no such excuse. This fondness for the ribbon-like ova of the *Perca* family is no false indictment, as we have been of those who, in the interests of the fisheries, have vainly attempted to drive away swans from the spawning-grounds. In these encounters the birds did not always get the worst of it; the blow of a swan communicated from the bend of its wing, even upon the end of an oar grasped by the hand, giving a shock to the muscles of the arm that has been felt for an hour afterwards. And then in these sallies we were not allowed to resort to violence or injury, as there are penalties attached to even disturbing swans while on their nest.

Taking eggs from the nests of swans and of certain other birds was an offence severely dealt with in olden times. Even the keeping a swan not marked, without license, was a misdemeanour; and stealing marked and pinioned swans is still felony. By the old law, when a marked swan was stolen in an open and common river, the purloined bird, if it could be obtained, and if not, another swan, was hung up by the bill, and the thief was compelled to give the party robbed as much meal as would cover all the swan, the operation being performed by pouring the grain on its head till it was entirely hidden. A similar fine was imposed for stealing a cat from the princes' granaries.

But why these enactments? The stomach, as in much that concerns our ancient laws, was at the bottom of it. The early history of gastronomy is in favour of the cygnet, though, unlike the goose, it was never charged as being 'too much for one, and too little for two.' We find it gracing the boards of emperors, kings, popes, cardinals, and bishops, all of whom knew what was good,

and how to feed; and whatever may be thought of their value for the table now, we learn that in the reign of Henry VIII., when money was of far greater value than at present, swans for the table were charged two pounds twelve shillings apiece, besides the cost for properly *carrying* them through the kitchen to the dining-room in full dress, one of which items of expense was warranted by a sauce of good strong beef gravy and port wine being poured *through* the swan almost continuously while on the roast, and then the bird introduced with *hot currant jelly*. There are those in the present day who affirm that cygnets thus cooked are delicious, and that if they fail to please the palate, they must have been kept beyond November, after which no amount of artificial preparation will preserve them in proper flesh, fat, and flavour. To the writer, who can eat most things, and is accustomed to roughing it, the taste is simply execrable; while others at the same table have declared that they could detect all the exquisitely combined *gout* of the goose and the hare; a discovery the writer has been disposed to impute to the overwhelming use of the currant jelly, subduing to tolerance the rank solan-geese-like flavour of the swan. Why, if otherwise, is it not now a favourite at our feasts? It possesses every ancient *prestige* to render it popular, and with relation to royal or City banquets, the fashion of 'killing one's own game' is yet more the custom than ever. Cannot the taste be revived?

Though swans have been driven from our dining-tables, they are by no means the more abundant on the water. Those which are to be seen at times in formidable numbers upon the Thames, between Chelsea and Staines, are chiefly the property of the companies of vintners and dyers of London. Those in the Windsor and Eton districts are claimed by the queen and the college, although the vintners' swans are not molested by right if they trespass thus far. It was a custom, at the close of the last century, to send six wherries as far as Marlow, manned with proper persons, to count and mark the swans. After this, it became, on the first Monday in August, a festive journey by the citizens as far as Staines, and the trip is termed 'swan-hopping,' a corruption of swan-upping, or going up to, or taking up, the young swans to mark them. Thus, the orders for the gamekeepers of the reign of Elizabeth shew this clear use of the term, when they ordain 'that the *upping* of all those swans near or within the said branches of the Thames, may be all upped in one day.' An illustration in *Life on the Upper Thames*, by H. R. Robertson, shews the manner of catching and collecting the birds when their legs are tied together over their backs. The way in which they are handled seems to a looker-on somewhat barbarous. The 'nicking' of the bill is done with a pen-knife, the last joint of the cygnet's immature wing is removed or clipped (termed pinioning), and the bleeding of both bill (which it does freely) and wing, stanchd with tar.

Indeed, the swan was considered a royal bird, and was protected by laws of a peculiar kind, and the privilege of keeping them was granted to certain persons only. The grant to the City companies was an especial compliment from the crown to the City—one of those concessions given at a period when the trade of England began to assume importance and rival that of the Low Countries, when

it became the wish of the crown to conciliate the wealthy traders, and to accord to them various privileges once held by nobles only. The rule adopted for the marks was thus: the bird, when young, was taken up in the presence of the king's swan-herd, and a mark was cut in the skin of the beak, the same as was on the mandible of the parent bird. These marks were entered in a book, and kept as a register of swans; any found without such mark were seized by the king, and marked with the royal mark. No new marks were permitted to interfere with the old ones; and all generally consisted of simple figures, and some few were heraldic. Yarrell gives illustrations of these swan-marks, as do other writers. In the reign of Queen Elizabeth, upwards of nine hundred corporations and individuals had their distinct swan-marks.

The swan's nest is an incongruous assemblage of reeds, straw, and stubble, which the bird has the instinct to *raise* while floods are impending, and has no claim to order or ingenuity in its construction. It is mostly placed in an exposed spot, open to the sun, as if the beautiful bird was conscious of its right to protection, and knew it was under the guardianship of special laws that secure its safety. On this nest the *pen* (female) lays some five to eight eggs, of a dull greenish white, and about four inches in length; six weeks after which the cygnets, of a dark leaden gray, come into daylight; the whole period of incubation being occupied by the *cob* (male) in acting sentinel, ready to attack any intruder, however formidable. The attachment of the mother to her brood is remarkable; and no more beautiful picture is to be seen on the river than a female

Swan superbly frowning,

And with proud breast her own white shadow  
crowning,

her neck gracefully arched, her wings raised as gunwales of protection, and the deck of this exquisitely modelled living craft crowded with her infant progeny, and stemming the rushing tide with her oar-like feet. The colour of the cygnets becomes less gray by time, and when they put on the robe of snow, mamma, hitherto most maternal, drives them off, to do battle with the world on their own account. This they do; and if they have not been pinioned, they mount high in air, and after a grand bird's-eye view of the eligibility of a new location, settle down on some distant piece of water, on which, if the aquatic resources of vegetables be good, and perch in plenty, they will, if not molested, remain for years. 'The job of education' over, the parent birds are free to mate again with fresh acquaintances, or keep on by mutual agreement their old love, which, to the credit of swan conjugality, they often do.

The swan is a long-lived bird, many reaching thirty years. But Willuby says: 'It is a very long-lived fowl, so that it is thought to attain the age of three hundred years;' 'which,' says Aldrovandus, 'to me seems not unlikely.' Mr Yarrell gives the swan fifty years' lease of life. One that lived and was murdered on the canal in St James's Park, known as 'Old Jack,' reached seventy years. Jack was a great favourite with Queen Charlotte, he having been hatched in 1717, on the piece of water attached to old Buckingham House, and translated, after being partly reared

and fed by royal hands, to the more extensive piece of water. He was very sociable, like many another biped, when he had his own way, but became cantankerous if put out. His strength and courage were astonishing. He has been known, when a portion of bun has been thrown upon the water, and a dog however large has contested the morsel with him, to seize the animal by the neck, and drown him; and on one occasion, when a boy of twelve years of age had been teasing him, Jack caught him by the leg of his trousers, and dragged him into the water up to his knees. How long poor Jack would have lived, it is difficult to say. When the Ornithological Society selected the canal as a 'playground' for their foreign specimens, Jack was pretty successful in his engagements with the intruders; but a legion of Polish geese at length arrived, who commenced hostilities with Jack, and having cowardly attacked him in a body, pecked him to death.

A swan of decidedly unamiable disposition ornamented the piece of water opposite the Museum in Kew Gardens. One day we found him, as we supposed sulking, as he did not come as usual to our call; whereupon the keeper told us that a few days before, it had gone ashore, and following a child with some confectionery, had struck it down with its wing, and robbed it of its treat. For this it was sentenced to keep the centre of the pond for a month, with a heavy weight attached to its leg, its food being carried out to it in a punt.

We have alluded to swans raising their nests in anticipation of floods. There are many well authenticated instances of this remarkable foresight. Here is one, the particulars of which were recorded from day to day as the events took place. There is a small stream above Bishop Stortford, a feeder of the Stort; a female swan of about eighteen years of age had reared many broods, and was become familiar to the neighbours, who valued her highly. Once, while she was sitting on four or five eggs, she was observed to be very busy collecting weeds, grasses, and other materials to raise her nest. A farming man was ordered to take down half a load of haulm, with which she most industriously raised her nest and eggs two feet and a half. That very night there came down a tremendous fall of rain, which flooded all the malt-shops, and did great damage. 'Man made no preparation, the bird did; instinct prevailed over reason, her eggs were above—and only just above—the water.'

An angler's aversion to a too great gathering of swans is not altogether founded upon their love for spawn, swans being certainly a great nuisance in those waters where the practice of trolling is pursued, the birds immediately flocking to the spot where the bait is cast, and seizing it if permitted. When thus disposed, no effort even by pelting them will drive them away. On one of the occasions, while casting, our hook caught the chest of the noble creature. At first, he apparently did not believe that such an indignity had fallen to his share; but presently, as the presence of the hook made itself known by the tension of our line, the swan looked down at the attachment, and seeing a spot of scarlet upon its snow-white breast, attempted to remove the hook with its bill. Ineffectual in this, it reared itself almost to standing on the water, and trumpeting forth a loud

defiance, made in full sail towards where we stood. Upon this we put on pressure, with the desire to sever the connection, but this only the more exasperated the creature, who, turning suddenly, made with extraordinary speed across the pool. Alarmed for the safety of our tackle, we had to play the creature as we would a salmon; and it was after more than an hour's 'play,' exhausting alike to man and bird, that the hook parted from its hold with a portion of the skin and some feathers, and released us both. From that time, however, we were never annoyed by the swans when pike-fishing in this lake.

Swans abounded at one time on the Kennet near Newbury, and they had become an abomination to the sight of the trout-fisher, who could not take a step along the banks without slipping here and there upon the grass they had destroyed by their splay-feet and droppings. The farmers had complained in vain that no creature would feed where they had trodden; and the luncheons of the fishers had been more than once invaded by those impudent birds. One morning we were surprised to notice that only two swans were observable in the whole of the reach. These two had their heads under water for so long a time as to excite our curiosity, when by punting up to them we found that the heads of both were fast in an otter trap; and the rest of the flight, as we were told, after most carefully scanning out the cause of the quiescence of their mates, deserted the district for some seasons afterwards. We have no reason to believe that the traps were laid for the swans; but when in other cases in which their eggs would not hatch, and the time for incubation had long passed, small holes were found drilled through the shells, the same verdict of non-wilful interference was not so readily arrived at.

Swanneries were common at one time in England; the swanherd was an appointment of some consequence, and persons who executed the office of 'master of the king's swans' in the counties of Huntingdon, Cambridge, Northampton, and Lincoln, may be traced on the parliament rolls. There was a swannery of some extent at Clarendon in Wiltshire, and one at Purbeck. There still exists a swannery in Norfolk, but this is private; and one at Ilchester on the Fleet, formed by the Chesil Beach which joins Portland Island. *Murray* tells us that 'this decoy and swannery forms a scene of great interest, almost unique in England, not to be missed by the visitor. The decoy is constructed for the wholesale capture of wild-fowl, which are enticed into its mazes by live birds trained for the purpose. The swannery is an inlet likewise of the Fleet, and affords a home to a flock of about six to seven hundred swans, which in the time of the abbots were many times more numerous. In the winter they are visited by wild birds of their species.' And *Broderip* says that 'a noble spectacle even now is presented there; for the swans are not crippled in the pinion, and the sight of some eighty of these splendid birds, many of them on the wing together, will not be readily forgotten by those who have witnessed it.'

Although few doubt at present the depredations which swans commit upon the spawn of fish, there are many who deny that they eat the fish themselves, contending that the construction of the neck would not permit them to swallow anything of a solid nature. The oft alleged destruction of

fish on the Thames by swans appears to us a mere fancy. The true source of destruction has been the fetid condition of the river, owing to the reckless inpouring of town sewage. Now that this odious system of pollution is in course of abatement, the Thames is becoming more prolific in its fish of various species, while it is open to observation that the swans are in excess of the past. Let the swans, we say, continue and prosper.

## STEPHEN BELL, THE USHER.

### IN EIGHT CHAPTERS.—CHAPTER V.

THAT Miss Priscilla had not mistaken her father's liking for the usher, was made evident to Bell the very next morning. On his road to the lodge, he met the keeper, and knew, by the heartiness with which he shook his hand, that the engagement had been revealed. 'Look here, Master Bell,' exclaimed the keeper; 'I don't go about to flatter folk. There are younger and smarter fellows than Pris might, maybe, have had, for all the town knows old Wat Lamsett is pretty well off, though it's only of late years that he has been able to write his own name, and there's nobody vallyes learning, Mr Bell, like them that feels the want of it. But there's not a man in the world I would sooner trust her to than to you; and there's my hand again on it. Pris says you may not be able to settle just yet, and then not in these parts. My idea is, that happy's the wooing that's not long in doing; but you know best, and wherever you go you have my hearty good wishes. After all, Pris is a girl—she's a very young girl in my eyes, you know—that any man may be proud on.'

This speech was succeeded by others in the same strain, so that no son-in-law could ever have been more warmly received in a family than was the usher; in fact, old Lamsett appeared, on this occasion, to have abandoned entirely the stern, harsh temper he was so accustomed to display. And it is a wonderful testimony to the discretion and fidelity of father and daughter, to tell that not a soul in Onslope, beside themselves, knew of the engagement until circumstances made it no longer desirable to conceal it.

After parting with the hale old man, Bell had a long mental discussion as to whether he ought to tell Miss Priscilla more of his reason for leaving England; but after much thought, he decided he would not do so. When he was gone, the disappearance of Alfred Rainwood would no doubt be ascribed to him; the very men who hired him would probably be the first to set afloat insinuations; and it was in that belief that he asked Priscilla always to remember and speak of him with kindness. In a legal view, he could hardly see any reason for concealment at all. Indeed, his undertaking was by no means an illegal one in itself; those who had always acted for the child authorised it; and but for the outer fact, as one may call it, that he was arranging to keep the boy where he could never hear of or claim his rights, it was really no more than changing from one school to another. He knew, and knew it better at every interview with Prior, whom he hated with an intensity that surprised himself, that every one concerned in the transaction fully speculated upon receiving a certificate of the

child's death erelong; but Bell satisfied his conscience by the knowledge that he would rather have harmed himself than Alfred; and there were other palliatives in the matter. He reasoned, that if he did not undertake the task, some far less scrupulous man might easily be found; and again, that even if the boy remained in England, there was no great chance of his ever knowing who he really was, or of his being able to assert his rights. On the whole, Bell decided it would be much better for the boy himself that he should go. We must remember, too, that for several years the usher had led a life not calculated to make his scruples greater, or his conscience more sensitive.

It could not but be flattering to his self-love to mark the eagerness with which Priscilla Lamsett awaited his coming, the evident importance which she attached to his visits, and the trouble which her father took, in his way, to shew his admiration of his son-in-law. After all, the keeper looked upon Bell as but a young man; so men of seventy-seven think of those who are barely fifty; and presents of poultry and fish, offers of a horse to ride, a gun to shoot with, and the like, attested Lamsett's good-will. The offer of the gun Bell accepted, and by way of providing him with the advice valuable to a novice, the keeper went into the woods with him in person. What he thought of his pupil may be judged of by the fact that he left him to himself and an under-keeper pretty early, and went on to the Hall with the butler, who happened to come across them; that he scarcely spoke a word on the road; and that, on entering the butler's room, he dashed his shot-belt down on the table, exclaiming: 'Give me a mug of old October, Master Phillips!' and then, having drunk the same, exclaimed further: 'That scholar beats cock-fighting! Man and boy, have I shot over these grounds for more than sixty years, with the earl that now is, and his father, and his father, and I ought to know what shooting is. I say there isn't such a shot within forty miles of Onslope—I do. And as for Squire Harbolt's keeper, and his shooting, that they make so much fuss about'—The snap of the finger and thumb with which the old man concluded spoke contempt for this rival's pretensions more plainly than a whole sermon could have done.

Day after day of the holidays flew by, and day by day drew nearer the date on which the good ship *Fair Rosamond*, A1, 1012 tons register, was appointed to sail for San Francisco. If by chance any of the few persons who took an interest in Bell or his pupil, had seen the advertisement relating to this celebrated clipper, they had little thought how nearly it concerned them. Bell had run up to London twice within the last few days, to settle various things connected with his passage; he did not intend to join the ship until the last moment, and as she belonged to a firm which was always punctual, he could reckon with certainty upon her sailing; he had called each time on the old lawyer at his West End house. On each occasion he had seen the principal himself, and the same clerk had always been in attendance; from this he judged that, however commonplace the business was intended to appear from the outside, the firm were resolved to have as few in the secret as possible. On his last visit, this clerk actually offered Bell a pinch of snuff; the usher was rather

surprised at this attention from such a dummy as the clerk had always appeared; he took the pinch, nevertheless, and noticed that the box was of massy gold, fitter, he fancied, for the master than the man. He received a cheque for his expenses, and was complimented by Mr Maine on the business-like way in which he was proceeding. Bell bowed to the compliment, but pricked his ears on the old gentleman mentioning some trivial arrangements he had made at Onslope; he was sure he had not spoken of them, and could not understand how the lawyer should know anything about them.

At last there was but one clear day left before the sailing of the ship; Bell prepared a letter for his employers, advising them that he would not resume his scholastic duties; and one in the name of some imaginary person, accounting for Alfred's removal. Another letter, which cost him some thought, was for Priscilla. He had purchased for her a gold watch and chain on his last visit to London, and presented his gift in the afternoon of the day referred to. Priscilla was warm in her expressions of delight at the gift; in her plain home she had never worn or coveted anything beyond the silver watch which had been her mother's, and she had mixed so little with strangers, and had had so little of pleasure or excitement beyond the gates of the park, that she was as susceptible as a girl of seventeen would have been in a bypast 'period.' At her earnest request, Bell promised to call at the lodge in the evening, to see her uncle; her mother's only brother. He was coming from town to spend a few days at the lodge, and he would be so glad to see Mr Bell.

So the usher promised; and was true to his word, after taking his quiet tea at Hanover House with Alfred. When the two took this meal together, which was commonly the case, the tray was brought into the playground, as the weather was gloriously fine; little Alfred enjoyed these repasts so much, that the very keenness of his pleasure brought with it a melancholy when he thought of the noisy school teas, and the impossibility of always having Mr Bell's strange, pleasant talk all to himself. This evening, the usher was not inclined to talk of foreign lands or wild beasts; yet, if graver than usual, he was kinder, and laid his hand on the boy's head very tenderly when he bade him good-night. He left the school, and strolled leisurely towards the Park; but he had not been gone more than three minutes before he heard his name shouted loudly, and turning, saw Mr Prior running after him. 'What is the matter?' asked the usher.

'I haven't a moment to spare,' gasped Prior; 'I have just come to say good-bye, and to ask if there is anything more to be spoken before you go. I am off to Yorkshire.'

'Nothing wrong, I hope?' said Bell.

'No—no; nothing wrong,' replied Prior; 'only some business. I must be in—Shropshire to-morrow morning.' He glanced sharply at Bell as he spoke, to see if he had noticed the change of county, but the latter's face was immovable. 'What I wanted to see you for now,' continued Prior, 'was just to ask if all was ready; money all right; no hitch, no difficulty. If there is anything needed, say so at once.'

'Nothing, I believe, is needed,' said Bell; 'I know of nothing to prevent my being in the

Downs in a little over eight-and-forty hours. My arrangements are complete, and my mind is as before.'

'Well, good-bye, old fellow!' exclaimed Prior; 'I wish you luck. And listen: *don't be a fool*. You know what I mean.' With these words he seized the other's hand, which was not proffered, wrung it with a show of profuse cordiality, and then hurried off.

'Humph!' ejaculated Bell; 'this is to me an unexpected move; I wonder if it is so to him.—Hollo, Boots! I am always running against you, it seems. Here is half-a-crown for you; I meant to have given it at the end of the half-year, but forgot.'

'Thank 'ee, sir,' said the man; 'we do seem to meet pretty often.' He touched his hat, grinned, and disappeared; nor would Bell have thought any more of the incident, but for his fancying, as he swung open the side-gate of Oakmount Park, that he saw Boots walking under the hedge of an opposite field; it might easily have been so, without any extraordinary coincidence, for there was a footpath in the field.

Bell passed through the gate, and, with the freedom of an assured visitor, entered the lodge; Priscilla, hearing his step, rose to meet him, and to introduce him to the stranger. The latter was seated at the farther side of the room, the darkest part at any time, and as the quiet evening light was almost excluded by the flowers which filled the open window, Bell could see him only indistinctly. With a flutter of pride, Priscilla introduced her uncle, Mr Daniel Trenlee; as she did so, the person indicated rose, and extending his hand to the usher, said: 'I have had the pleasure of meeting Mr Bell before; in fact, we are quite old acquaintances.'

Bell, who was but seldom off his guard, staggered back in amazement. Why, this was the clerk from the great lawyer's; this was the confidential man with the golden snuff-box; this was the man who must know or guess everything relative to his intended flight—and this man, too, Priscilla's uncle! Although astounded by the discovery, the usher quickly recovered himself, and expressed the pleasure he felt at meeting him again, and so forth; but while calm enough outwardly, he was in a maze of speculation and wonder as to what turn events would take, and whether the clerk would feel it his duty to open his niece's eyes, when he found that she was engaged to be married to a man who was embarked in so doubtful an undertaking. His doubts changed to surprise, when he found, by a score of little jokes and hints, that the clerk was already aware of the engagement, and approved of it, as was plain from some of his hints conveying allusions to his own wealth, and to the fact that he had neither wife, chick, nor child, and that Pris was a favourite of his. So Bell decided that the bias which the father and daughter had in his favour, had, by their partial representations, been extended to the uncle, and he was not sorry to find that it was so.

It grew so dark that Priscilla rose to get candles, but Mr Trenlee stopped her. 'Let a poor Cockney enjoy the beautiful twilight,' he said; 'it is all very well for you country folks, who have it every night, to think nothing of it, but we are different. Besides, Pris, I have now some business to talk over, which had better be done before your father comes in,

and to talk over which brought me down into Hertfordshire to-day; two days later would have been too late, as Mr Bell knows.'

'Now, it is coming,' thought Bell; but the idea did not disturb him, as it had at first, for he felt sure of the good-will of the clerk; though why it was so, and what line the old gentleman was going to take, were utterly beyond his penetration.

The clerk began: 'Come closer, Pris; and Mr Bell, do you draw up. There are no listeners in this quiet place, I know, but one feels safer when all precautions are taken.'

His listeners complied, and the three gathered round a small table at the window.

'I came down here, Mr Bell,' continued Mr Trenlee, 'not at all aware of the intimacy between yourself and my niece; I congratulate you both, now I know it. But when I first heard of it, it occasioned me the greatest perplexity, for it was on your account I took this trip. I have left Maine, Firth, and Maine.'

'Indeed!' said Bell; but Priscilla only smiled.

'Yes; I virtually left them some months ago,' returned Trenlee, 'for I have only waited to see the closing of a few transactions in which Mr Maine, the senior, was interested. I have been with him fifty years; so I have earned my retirement. He is older than I am, and is almost past work; but to oblige one influential client he personally attended to a certain little business—as you know, Mr Bell. Your affair is finished; he has gone from the firm, and I have left. Now, I know you are going to California' (Priscilla caught her breath, and clasped her hands at hearing this); 'and as you are going to marry my niece, I mean to have a very different conversation with you than I had at first intended, and shall let you know more of the matter you have in hand than, I daresay, they have told you. This is all in strict confidence, you know, and never to be used except for our own safety or benefit. It is nothing to us what other people do, only, if they want to make tools of us, it is but natural we should see if we cannot be edged tools sometimes. I can answer for Pris's silence, and you ought to be safe if you are trusted in an affair of this kind. Now there is a child at school here under the name of Rainwood, whom you have agreed to take charge of in America, until he grows up; unless, indeed, you prove yourself apt at understanding what is wanted of you. As you perhaps know, he is his father's oldest and only child, and the father would marry again, but could assuredly not marry where he wishes, if that boy were known to exist. This man, sir, this father, is a dreadfully bad man; his father is bad enough; but it is only the latter's influence which has kept the son from making short work of the poor boy long before now. There is some vow or superstitious rite which the younger man has performed, which keeps him from harming the child. I should have thought he cared nothing for any pledge or vow, but it seems he is restrained by having taken an oath never to hurt the boy—and it is his own child I am talking about; but if he could get it done at second-hand, without actually giving the order, he would be pleased. Things have come to a crisis; if he delays much longer, he will probably lose the chance of marrying a lady of great wealth, and so he and his father have arranged to send young Rainwood, as they call him, quite away, and they have pitched upon you

as their agent. I don't know how they found you out, in the first instance'—

'I was chosen, I suppose,' interrupted Bell, 'because I was the only master left at Hanover House during the holidays, and little Rainwood was the only pupil. A man named Prior is the person who first opened the matter to me.'

'Prior—Prior!' mused Mr Trenlee; 'I don't know him; but it would not be difficult to get a safe man, especially as perhaps even he was not trusted with real names. Bless you! those in the secret only know it piecemeal among them, excepting myself; and I have tried to find out by what channel they were working, but could not succeed. The agent, however, seems very well satisfied with you, although, like a prudent man, he has watched you rather closely. I saw you look up sharply enough when old Mr Maine was talking about your arrangements at this place; he let out more than he should have done; but, there! you could hardly light your pipe without a report being made of it to headquarters.'

'Indeed!' exclaimed Bell.

'Yes; it's quite true,' continued the clerk: 'this Prior had a man in your house in his pay—one Joseph Dodds, who is a sort of groom there, I think.'

'Why, he is our "boots!"' exclaimed Bell; 'and your information accounts for my always stumbling over him, go where I would.'

'Of course, it does,' assented Mr Trenlee, with a smile. 'Well, that's enough about the machinery employed. What I have to tell you—and the information may some day be worth thousands to you—is the real name of the boy, and consequently that of his father; also where his mother is.'

'I thought, from Prior's account, and from all I had heard before, that she was dead,' said Bell.

'So they report, and so, possibly, this Prior believes,' replied Trenlee; 'but that is just the most important part, to my thinking, of the secret. She is alive, but in a private madhouse.'

'Mad! Poor thing!' said Priscilla, who had been listening, the most interested, probably, of the three.

'No more mad than I am,' returned the clerk; 'but, under another name, there she is, down in Yorkshire; but she will not be there long'—

'Yorkshire!—how extraordinary!' ejaculated the usher.

'Why extraordinary? Why not Yorkshire, as well as anywhere else?' asked Trenlee.

'I could not help interrupting you,' said Bell, 'for, as I was coming here, Prior ran up to me to bid me farewell, and to say that he had suddenly been called to Yorkshire.'

'Well, they may want him down there,' said Trenlee, after a moment's reflection, 'for they have had some trouble with the young woman lately; she succeeded in breaking out, I hear, and nearly got away, but luckily they recaptured her.' He said 'luckily,' and evidently meant it, for his ideas wandered no further than strategy or policy. The right or the wrong of the matter did not trouble him; besides, if they had not caught her, of what value would have been this now-important secret? 'They are going to remove her to-morrow, as the present situation is not lonely enough. She is the only patient in the house,' he continued; 'and as she is as sane as any one breathing, they

are obliged to take unusual precautions with her'—

'I thought,' interrupted Bell, 'that commissioners of some kind occasionally visited the patients at these houses.'

'So they do,' explained Mr Trenlee; 'but they never see *her*. They always see the keeper's wife dressed up, who answers to the name of the patient—and precious rubbish she talks, you may be sure. The effect of this is, that if she could make any appeal, the commissioners themselves are so convinced of her madness, by what they consider the evidence of their own eyes and ears, that they would pay no attention to anything she might write. I should not wonder, however, if this Prior is going down from her husband to see about shifting her abroad also. I know that some men are engaged as her keepers; and if she does go abroad, take my word for it, Mr Bell, whatever may be her son's luck, she will never see England again; and I will lay this snuff-box—pure gold, Mr Bell, a present from my old master—against a fourpenny-piece, that she is not alive this day six months.'

'O uncle!' exclaimed Priscilla, 'if you think that such wickedness is afloat, can you not do something to thwart it, and save the poor lady? I feel as bad as the wretches themselves, to hear of their plots, and do nothing.'

'My dear Pris,' replied her uncle, sententiously, 'you don't understand these things. In the first place, it is no business of mine, or ours; Mr Bell could get nothing by interfering and exposing these schemes; you must remember *that*. And in the next place, we have no proof of anything being wrong; my suspicions would amount to nothing in a court of law. In fact, I am only explaining all these circumstances so that Mr Bell shall know as much about them as myself, in case anything should happen to me, and he should find it desirable to use the information. Nor did I get the knowledge in my own confidential department of the business; if I had, I could not have told it to you. I received great part of it—enough, with what I knew, to account for all—from a clerk in the office, whom the husband chooses to trust in preference to myself, and this clerk owes me money, which he can't pay; so there it is. Well, now to go on. The wife, you see, is safe enough; and I am not sure that even the resident keeper knows her real name. She is there as Mrs Mary Robinson—a not very uncommon name, you must own; and perhaps, if she has ever told her true one to the keeper, he does not believe her. Her son—who, she believes, died some years ago, as they professed sympathy with her sorrow sufficient to allow her to wear mourning—goes by the name of Alfred Rainwood; so, if, by any extraordinary chance, he were to hear of her, or she of him, there is nothing in the names to remind them of each other.'

'I fancied,' said Bell, 'that we should hear that Rainwood was the maiden name of this lady—poor creature!—as I, of course, guessed it was not his father's.'

'Oh, they would not run such a risk as that. But now for the secret.' The clerk lowered his voice here, and his hearers each bent forward to listen. 'His father is Captain Reginald Maylis, of whose resignation—I may say expulsion—from the army, some time back, you must have

heard. The grandfather is old Sir Reginald Maylis, the banker; and this boy's name is Reginald Maylis also. He was born near Plymouth, and you will find in Saltash Church the registry of his birth. Here is a copy. His parents were married at St Michael's, Coventry, all being regular and in due form, as this second document, which you had better place with the other, will shew. When we have light to read, you will see that Reginald Maylis, captain, was married by license to Katharine Rose Daniton, parents dead; and with these papers'—

'Oh, good heavens, what is the matter?' exclaimed Priscilla. 'What ails Mr Bell? Oh, help me, uncle!'

This exclamation was drawn by the usher suddenly rising from his chair, and falling heavily to the ground.

'Get lights, girl, at once,' said the clerk, who was very cool; 'he is in a fit; I daresay he is subject to them—quick!'

With a great effort, Priscilla controlled herself, brought lights, and drew the curtains; her uncle had already raised the insensible man to a sitting posture, but his strength was not sufficient to lift him from the ground. He removed his neckerchief, while Priscilla fetched water and stimulants; by aid of these, Bell soon gave signs of returning consciousness, and could lend such slight help to his companions as enabled them to place him on the sofa.

'Hollo! you are all right now, old fellow,' said Trenlee, slapping him gently on the shoulder; 'but you gave poor Pris a terrible turn, and quite staggered me. What was it—a dream?'

'Yes,' said the usher, faintly, but distinctly—'I have awakened from a dreadful dream. I am better now. Finish your information.'

'O no, Mr Bell,' exclaimed Priscilla; 'pray, hear no more to-night. I fear you grew so excited with the story that it made you ill. We will talk more in the morning.'

'God bless you, Priscilla!' said Bell, with more warmth than he had ever before shewn, fondling the hand which she had laid on his. 'What you said earlier to-night, would have taught me my duty, had I not been callous of heart.—But I must know a little more, Mr Trenlee; for instance, you have not yet said where this lady is.'

'Well, that must finish for to-night, then,' said the clerk; 'in short, there is no more to be told, and the fact itself is of little consequence, as she is to be removed immediately. But I will find out where they take her, trust me.'

'But where is she now? why don't you say where she is now?' demanded Bell, somewhat impatiently.

'Dear me, how irritable invalids always are,' thought Trenlee; then added aloud: 'She is at Briar House, about half a mile from the little village of Rattle in Yorkshire, on the Skipton Road. I know the place well; I have been there, on other business, a dozen times.'

'Thank you,' said the usher.—'Now, Priscilla, let me beg a drop more of the brandy.' His request was complied with, and he continued: 'You see, Mr Trenlee, how steadily I can pour out the spirit, and how steadily I can hold the glass. I fancy I am as cool and composed as I was an hour ago.'

'Quite so; better, in fact,' agreed the clerk, who

would have said anything exactly opposite to please and reassure the invalid.

'Very well,' continued Bell; 'then you will perhaps walk outside the lodge with me for three minutes, while Miss Lamsett is preparing supper, as we must be in her way.'

'Certainly,' said Trenlee, who of course saw that this trivial excuse was but a cover to something more important; so they went out together, and walked to and fro in the broad park avenue.

Whatever it was that the usher had to say, his communication appeared to surprise Trenlee almost as much as the latter's story had affected him; and at the end of a far longer conversation than Miss Priscilla had expected, the two shook hands warmly, and re-entered the lodge. On his niece gently reproaching them for their delay, Mr Trenlee said: 'We are about to behave far worse than that, I fear, Pris; but you know when I am in earnest. I am very much so now. We must find your father, in the first place; and in the next, you must contrive to make up a bed for Alfred Rainwood.'

'Alfred!' exclaimed Priscilla; but she asked no questions; as her uncle had said, she knew when he was in earnest.

The clerk continued: 'Mr Bell and myself are going a very long journey to-night.'

'To-night!' gasped Priscilla.

'To-night,' repeated her uncle. 'We shall catch the last northern train, which stops at Onslope in about a couple of hours. We shall want a third party with us, and he must be a younger man than I am, or I would take your father. I want a perfectly trustworthy, silent, and courageous fellow. Now, who can we have?'

'Dick Willand at the Hall is just the person,' said Priscilla; 'he is under the steward there, and he would do anything for father. You may trust him with your life; and he is the strongest man in Onslope.'

'Then he is just the fellow for us,' said Trenlee. 'So, Pris, you must take your lapdogs, and go to the Hall for Mr Dick; tell him to be in readiness within an hour, and he will not be away above a day or two. I will go and find your father; he is sure to be with Barnes the butcher, over his invariable cribbage.—While you, Mr Bell, will fetch Alfred.'

The old gentleman's decisive manner left no possibility of delay or dispute, and in less than five minutes after he had spoken, the lodge was deserted, and each of the three speeding on the errand directed.

#### A PERUVIAN RAILWAY.

THE development of engineering science during the past century has been most remarkable, and seemed to reach its climax when the Mont Cenis Tunnel was completed with perfect success. But this has in its turn been surpassed in the far-distant land of Peru, where perseverance has overcome natural obstacles which would have been considered insurmountable a few years ago, and the mighty chain of the Andes is on the point of being crossed by a railway at an elevation of between five and six thousand yards. This is no ordinary work, and it may not be uninteresting to give a slight sketch of its progress.

Peru, which is traversed from north to south by the Cordillera, is thus divided into two very different regions. That narrow portion which is bordered by the Pacific is sandy and arid, crossed at rare intervals by valleys more or less cultivated, and veiled during three-quarters of the year by a thick fog. It seems as if nature, imitating the jealous care of the miser, had sowed desolation over this part to hide from man's cupidity the incomparable riches which lie beyond. On the other side of the mountains, the rich basin of the Amazon stretches out in all its beauty, with the grand tributaries which water it. Whilst the few streams which flow into the Pacific are torrents which cannot be navigated, the Ucayali, the Tambo, and the Apurimac on the other side roll their deep and limpid waters through vast forests. Between these rise the peaked crests, the volcanoes, and snowy summits of the Andes, rising to a height of eighteen thousand feet, presenting a series of plains covered with thin pasturage, or forming deep valleys of wonderful fertility.

It is thus easy to understand how necessary good roads must be for the prosperity of the country. Yet, until the last two years, a highway fit for carriages was unknown between Lima and Callao on the coast. At the very gates of the capital, a few carts were dragged through sandy ruts; but soon this changed, in the sierra, to a path only accessible to mules; everything being carried on the backs of these animals, or llamas, marching one after another in Indian file. This will account for the immense price of many articles of merchandise; for, when the freight from this country to Lima costs two pounds a ton, twenty pounds more is required to get it a hundred miles up the country. Though roads were thus wanting, Peru possessed two short lines of railway as early as 1848, one uniting the capital with the port of Callao, and the other to the sea-baths at Chorrillos; both have answered well for the shareholders.

It was not until 1869 that any new enterprise was discussed, when the arrival of an American capitalist, Mr Meiggs, well known on the coast of the Pacific, where he had constructed a railway between Valparaíso and Santiago, gave an impulse to the work. To get the riches of the interior conveyed across the Andes, to encourage emigration to so delicious a climate, and in time to open a way to Brazil, marked out the objects of the advocates of the central line. Three valleys converge towards the capital, all equally fertile: the first leads directly to Cerro de Pasco, a very rich mining country; the second to a less known district, but incredibly fertile, and supplied with splendid forests; the third to the valley of Jauja. After due consideration on the part of the engineers, the second of these was decided on, through the valley of the river Rimac; for, though narrower, the incline is more regular, having fewer cascades and precipices.

For this great undertaking the government gave gratuitous use of the lands belonging to it, all the material necessary to be admitted free, and a large sum of money. From eight to twelve thousand Chilians and Chinese were engaged as workmen; and the whole is now in such an advanced state, that on the 21st of July 1876, Peru hopes to

celebrate the fifty-third anniversary of her independence by the opening of this railway.

Taking the report of M. d'Avricourt, a gentleman resident at Lima, a few of the difficulties may be described. The line begins at Callao, and for some miles passes through a well-cultivated valley, but gradually the incline rises to four in a hundred, where the river and some alluvial land fill up the narrow space. Here begin enormous cuttings, one not less than a hundred feet in depth, where supporting walls are necessary, many tunnels, and above all, the famous viaduct of Verrugas, the highest in the world, between five and six hundred feet in length, and nearly three hundred feet in height at the centre. It rests on three vertical pillars, having a base of granite and Portland cement. The bridge, which is entirely of iron, and weighed six hundred tons, was brought in pieces from North America, where it was forged.

Twice has the torrent of the Rimac to be crossed by bridges no less remarkable than the Verrugas viaduct; the height must necessarily be very great to admit of the swollen stream when the snows are melting. There is a graceful little detour beside two valleys, when the rail reaches Mantucana, and is once more on a level with the river; already it is above seven thousand feet higher than the sea, but to reach the ridge of the Cordillera an equal distance has to be surmounted. At the first glance this seems impossible, for the valley entirely disappears, and the Rimac rolls its foaming waters between perpendicular rocks, the summits of which seem lost in the clouds. The eye seeks for a road, and sees nothing but narrow, deep gorges and dry hard rock. Here and there, the torrent slackens its course, and in some nooks the Indian has built his cabin; the water irrigates his field, and from his knowledge of how to employ it at a considerable height, a green patch may be discerned here and there on apparently inaccessible eminences.

But this mountain-culture is not exempt from danger. Last year, Lima trembled for its existence on seeing the flow of the river suddenly stopped. Under the constant action of the filtering of the water to their fields, through canals cut by the Indians, a mountain crumbled at once, intercepted the Rimac, and transformed it into an immense lake, which filled for many days the valley up to Mantucana. The line of the railway disappeared, and many men were buried in the ruins, but the dam thus formed was happily sufficiently strong to keep the waters within their new limit, and again they resumed their course by forming a waterfall over the obstacle.

From this place the spectacle which nature presents makes it a wonder how a locomotive can cross such terrible defiles; no less than thirty bridges and viaducts in one long succession pass over the ground, and when a curve is impossible, a zigzag of the form of the letter V has to be employed, a condition always unfavourable to the movements of a line of carriages. This is done for the first time after passing the frightful gorge of Chacahuaro, where the mountains separate a little, and the eye rejoices to see the picturesque village of San Mateo. But all too soon the valley closes up, disappears, and there is nothing but a vast chasm, at the bottom of which the river rolls along majestically, bordered by two steep walls of rock. In the distance the sound of the waterfall is heard, and the white foam rushes down the

stream, the mule-road cut in the rock leads through a hundred windings, whilst masses of porphyry hang over the abyss, threatening to crush the traveller. This is the celebrated gorge of the Infraillo, perhaps the finest in the whole chain of the Cordillera. The Rimac, about thirty yards in width, falls over the rocks at a height of a hundred and twenty feet.

To make a railway through such a defile was an impossibility; but, by first carrying the line to a considerable height, it was practicable to pierce the rock for a tunnel, throw a bridge over the river, and again enter the earth for a considerable distance, still continuing the interminable ascent. Another fine viaduct, three hundred feet long, brings the line to Chicha, a region very rich in minerals of various kinds, the working of which only waits for the iron way to bring them down to the coast. The principal difficulties are now overcome; the valley is wider, and the Rimac is no longer an impetuous torrent, but a miserable stream fed by small rivulets; the mountains have a grander but more desolate aspect, and at the end of the defile rises a snowy peak, which dazzles the eye with its brilliancy. The mules travel on slowly; both they and their riders suffer from difficulty of breathing, owing to the rarefaction of the air at that tremendous height. One last tunnel marks the culminating point; and on the high plateaux of the Andes the railway proceeds until, by an easy descent, it arrives at the miserable village of Aroya, only important as the terminus from whence branch off the roads to Jauja and Tarma.

The fort of San Ramon, lost in the midst of forests, marks the eastern limit of the republic; under its shelter several farms have been chosen, and their prosperity affords a striking example of the return which labour can obtain in this rich country. The colonists are in every case realising fifty per cent.; all are rich, and many had no capital to begin with: the axe of the pioneer has cut down the tropical vegetation, and rice, coffee, and rum are largely exported. On the day when the railway shall join the twenty leagues which separate this little fort from communication with the Amazon, where Admiral Tucker, with his flotilla, waits the arrival of the engineer, Peru will have opened a new entrepôt for commercial progress, and its productions carried between the two great oceans will procure for it the first place in South America.

It only remains to be seen what are the riches which this land can offer. There are truly few countries where nature is so prodigal. The sand of the coast-line, in appearance inimical to all vegetation, is, on the contrary, virgin soil, which, without tillage, gives a hundred per cent., if water can be supplied. The fields were formerly irrigated with rare skill by the Incas, and now agriculture has greatly developed during the last few years. Rice, cotton, and sugar farms are abundant on the coast. To the south, in the valley of Canete, the sugar-cane grows with a vigour unequalled even in the Antilles. Cut at the end of two years, it will furnish another rich harvest in the same time; and on some lands seven or eight gatherings without a new plantation being made. The owner of a small plot of six acres admitted that his profits amounted to eight hundred a year. In the northern part, it is more developed, and one manufactory is spoken of where eight hundred

quintals a day are made, each quintal being worth about a guinea. This result may be thought exaggerated, but it is rather below than above the average.

The culture of cotton has not been so successful, for though the climate is so mild and equable, it requires greater care. The vine grows luxuriantly, from which very good wine and brandy are made; whilst the cacao gathered around Cuzco produces the best chocolate in the world. The colder climate of the hills permits the potato, wheat, barley, and oats to flourish; and on the other side of the Andes, in the wild district which they call the *montana*, the most valuable trees crowd and stifle each other in their tropical luxuriance—among these are the cedar, the mahogany, the ebony, and the cascarilla, the bark of which supplies a valuable medicine.

The famous mines of Peru must not be forgotten; but, alas, those which in the last century gave millions to Spain, now scarcely produce sufficient metal to coin for the country. There still exist seventy mines of gold, and nearly nine hundred of silver, besides those of copper, mercury, and lead; but during the war the works were abandoned, water has invaded the galleries, and great expense in pumping would be necessary before their hidden riches could be uncovered. Saltpetre, coal, and petroleum only require labour to develop them; the latter is met with very near the surface, and not far from the sea. To the south, in the salt country of Tarapaca, the ground is one immense bed of saltpetre, and a rail, now nearly completed, is intended to bring the coal from the district of Huaraz to the coast. This is of a superior kind to that which has been found in Chili. Almost all the coal now used is brought round Cape Horn from this country, and sold at an incredible price, so that to have it on the spot will be an immense advantage.

It would be strange to pass over in silence the great source of Peruvian riches, and almost the only resource the state can offer to its creditors, guano. It was not unknown to the Incas, who employed it with success in agriculture; but its value was forgotten until Humboldt visited the country in 1804, when he sent some specimens to two French chemists for analysis. Little attention was paid to it; but thirty years after, when M. Cochet recommended its use, he was looked upon as mad, and died poor and unknown in a hospital at Bordeaux. However, the discovery was not lost, and for many years past Peru has reaped an enormous fortune from her guano islands. Some of the deposits are now exhausted, but others are worked, and will insure a certain revenue for at least ten years to come. The chemical manures now made may reduce the value of guano, but though the phosphate of lime used for them is abundant, the nitrates, which are equally indispensable, are almost wanting in Europe, but are met with in a pure state in Tarapaca.

In this favoured land of Peru there exist rich crops, splendid timber, metals, minerals. Unhappily, however, independence, while bringing the shadow of liberty to Peru, has not developed in the nation, as among the Chilians, a love of labour, which must be the first condition of a nation's prosperity. The Cholos, or Indian race, disdain field-work, and are content to live in poverty; and the blacks, a robust people, willing

to work, have almost disappeared since the abolition of slavery. It is to the Chinese emigrants, more than ten thousand of whom disembark yearly at Callao, that the country looks for help; their quiet resigned character and superior intelligence render them there, as elsewhere, a most valuable resource in industrial and agricultural work.

#### A WELCOME WINDFALL.

IN a luxuriously furnished drawing-room, whose windows faced Hyde Park, one lovely afternoon in June 18—, sat a lady, whose age, judging from her appearance, was about twenty-three. She was alone, but, by her restless movements and varying expression, it was evident that some one was momentarily expected. Her face was a fair one, but bore on it the unmistakable impress of anxiety, which shaded features of no ordinary beauty. She was simply but elegantly dressed in a pale mauve muslin; and on her white fingers glittered some rings of great value, in addition to the one plain circlet which proclaimed her to be a wife.

She glanced with an anxious look from the window towards the Park, and sighed.

'Not a sign of him. What can it be?' Then she paced up and down the room, until a knock at the door arrested her, and her maid entered, holding in her arms a fragile and perfect dress of white tulle and costly lace, which had just arrived from Madame Elise, with an inquiry whether Mrs Vivian would wear it that evening, or decide upon another. Mrs Vivian—for such was the lady's name—without a glance at the dress in question, replied: 'No, Forrest; you can put it away. I don't think I shall go out at all to-night.'

Forrest retired at once, not without sundry suppressed comments on the extraordinary decision of her young mistress. 'Not going out, after ordering this lovely dress, and to the duchess's ball too—well, I never!' And feeling quite aggrieved, Forrest carried it up to Mrs Vivian's dressing-room, and deposited it carefully on a sofa. 'Maybe she'll change her mind when master comes in,' she reflected sagely, 'so I won't put it in the wardrobe.'

At seven o'clock, a hansom dashed up to the door of the Vivians' house, and in a moment or two Mr Vivian was with his wife.

'Oh, my darling Charley, why are you so late? I have been in despair about you.'

'I couldn't help it, Alice; you don't know how glad I am to get back even now.' He kissed his wife fondly, and they seated themselves together, whilst he prepared to explain the reason of his delay.

'I see it is bad, Charley. Don't be afraid to tell me,' she said eagerly.

'It is bad indeed, Alice; it hardly could be worse. I have moved heaven and earth to try to get some more money; but unless a miracle happens, nothing can save us. Everything has gone down, down, down; and unless a marvellous rise comes within the next week, I shall be utterly smashed.'

'We can but hope,' murmured Alice; 'and if the crash comes, we have each other.'

'My own wife, my brave, hopeful, loving wife,' responded Mr Vivian fervently, 'you are indeed a precious comforter! Yet it is principally on your account I dread it.'

'Don't think of me. I shall be happy wherever we are, and feel I can bear anything better than this uncertainty; it seems like being on a precipice.'

The two sat talking for some time, in turns comforting each other on the subject of some coming disaster which it was evident they considered it impossible to avert. They had only been married six months; and when Alice Annesley became the wife of the rich banker Charles Vivian, the world in general smiled on her nuptials and considered her a most fortunate girl, for he was young, prosperous, and handsome, and most truly in love with her; whilst she, entirely returning his affection, thought little of the pecuniary advantages of her marriage, in comparison with the fact that her lot was in future to be linked with that of one who so thoroughly possessed her heart.

Miss Annesley was an orphan, and, up to the time of her marriage, had lived with a married sister, some ten years her senior, a Mrs Frederick Atwood. Mr Atwood was a City man of considerable wealth, and it was through him that Alice had made her husband's acquaintance; and in six short weeks after meeting for the first time, they were married.

Little was known of Mr Vivian's antecedents beyond the fact, that he was a distant relation of a very old family of his own name; that he possessed no near relatives, but was eminently agreeable, belonged to a first-rate club, was a general favourite with both sexes, and was invariably met in the best circles, which was a conclusive proof that there was nothing objectionable about him. He had, not many years before meeting Alice, become a partner in a banking-house in the City, and as from that time his wealth seemed constantly to be increasing, it was generally believed that his business was a first-rate one. And, indeed, so it had been; and when he married, he could afford to install his bride in one of the nicest houses in London, with every appliance of comfort and luxury. It was a wonderful marriage for Alice, who only possessed a small yearly income of one hundred and fifty pounds, which, however, her father's oldest friend and family lawyer, Mr Upton, insisted should be settled safely upon herself. This caution on the part of the lawyer was deemed by Mr Atwood to be superfluous; but Mr Upton was firm, and, in spite of remonstrance from even Alice herself, did his utmost to make the bridegroom elect settle a certain amount upon her in addition; but here he failed, and was obliged to be satisfied with having secured her own money—a good deed, for which no one thanked him at the time.

Mr Vivian gave his wife magnificent presents; the Atwoods were most liberal; and friends seemed to start up in every direction, eager to add their offerings to the bridal gifts so plentifully bestowed on the future Mrs Vivian. To be brief, the marriage took place, and the pair went abroad for a few weeks, returning to England, first to pay a few country visits, and then to take possession of their new house, and to take their part, in due time in one of the most brilliant seasons ever

known in London. Mr Vivian was rich, Mrs Vivian was a beauty, and before she knew it herself, Mrs Vivian was the rage. Every one called; invitations were showered upon them; and though they both agreed in thinking a quiet evening now and then would be very welcome, it was almost impossible to achieve such a thing.

But a shade seemed gradually to envelop Mr Vivian, and though his devotion to his wife was evident, still, it was apparent that his marriage was changing him, for he was now not the same man. Alice perceived the alteration, and first wondered, then trembled, and then charged him with it, nor desisted until she had gained his fullest confidence. In the midst of their gaiety and magnificence, she heard that her husband was on the verge of ruin. He told her all, unburdened himself to her sympathising ear, and so relieved himself of half the anguish which concealment had entailed. It was the old story: speculations had failed, which, as a partner, he shared in; others had been ventured on, but were equally unfortunate: and it now required but one whisper against the solvency of the bank to insure its ruin. To avert the possibility of suspicion, Alice went out as usual, and received visitors in her splendid home with a smiling exterior, which covered, alas! a sinking heart; while he struggled to avert the dreaded crash, returning home every afternoon jaded and worn, only to have to brace himself up to accompany his wife to some gay scene, sadly in discordance with their feelings, but a necessary effort to avoid suspicion. Matters, they vainly hoped, might yet be arranged, and they would be able quietly to withdraw from their present position without the fiasco which a sudden collapse would entail. They must fulfil their engagements, and, worse still, allow a ball, for which Mrs Vivian had, little dreaming of what was imminent, issued innumerable invitations. Poor Alice! no wonder that her heart sank when she thought of what might be in the future, or that she almost recoiled from the sight of the lovely robe held out for her inspection by her maid, and which she had intended for that particular evening. Her husband had been most anxious for her to go to the Duchess of —'s ball, and when an invitation came, Alice too had been highly delighted, and sent an acceptance, little dreaming what an ordeal it would prove.

Tired, and miserably anxious as he was, Mr Vivian decided that they must go, if only for a short time. So they went. What a scene of splendour and magnificence it was, that brilliant throng, with their gorgeous dresses, glittering diamonds, and their smiling animated faces! All seemed happiness and radiance. Every one was cordial, every one was kind. Alice was surrounded at once; and during the short time they remained, the Vivians only saw each other at a distance. Alice's eyes were constantly looking towards her husband, while his sought hers as constantly. At last, heart-sick and weary, they departed, thankful to find themselves rolling rapidly homewards in their own luxurious carriage. The next day, Mrs Atwood came to spend the day with her sister, and having announced her wish to remain until dinner-time, Alice found herself alone with her, after Mr Vivian had set off for the City. No sooner had the door closed upon his retreating figure, than Mrs Atwood remarked: 'You are in-

deed a lucky girl, Alice. Charley seems to grow daily more devoted, and what a house you have!'

'Charley is everything to me,' replied Mrs Vivian in a low tone, at the same moment bending over her embroidery, to hide the quick flush that mounted over her fair face at her sister's words.

'Fred says he is a perfect millionaire,' pursued Mrs Atwood.

'Does he?' responded Alice faintly. 'Suppose we change the subject, Clara?'

'You are a curious being, Alice,' exclaimed Mrs Atwood. 'I don't think you know when you are well off; but I won't enlarge upon your good-fortune, since you don't like it. We want you and Charley to spend August with us in Scotland. Fred has secured the shooting he wrote about, and he would rather have Charley with him than any one else. Do you think you can promise to come?'

'I must ask Charley,' answered Alice. 'It is very kind of you, Clara, and you know how much we should both enjoy it.'

'Then, I shall consider it settled,' said Mrs Atwood. 'I am sure you need a change, Alice. I heard you were looking shockingly pale last night, and even Charley does not look as if such a gay life suited him. How nice he is!' she added, reflectively. 'I am really very fond of him myself.' Then she indulged in many self-gratulatory remarks on having been the promoter of Alice's good-fortune, whilst the latter quietly acquiesced, bearing the unmeant shafts, which Mrs Atwood's innocent allusions to her husband's prosperity inflicted, as she best could.

Two nights afterwards, the Vivians' house was the scene of a splendid entertainment—rich and noble guests thronged the brilliantly lit drawing-rooms, and amongst them their fair hostess moved with a glow on her cheek of almost unearthly radiance. Never had she looked more lovely, but never had her heart been so bitterly wrong as on that last gay evening in the house in which her brief reign was now over; for, before the first guest had arrived, Mr Vivian had heard fatal tidings—and he and his wife both knew that the worst had come. It did not look like it. Those magnificent apartments, the signs of wealth in every direction, surely did not mean ruin; but the words rang in Alice's ears. As each arrival was announced, she pictured their faces on the morrow when they should hear of the Vivians' ruin. 'Ruin' was written on the walls, 'ruin' rang out above the voices of the multitude, 'ruin' seemed everywhere to poor Alice. Only one mortal eye guessed her secret—one honest heart felt for her, and that was good John Upton, her father's friend, who had known her from her childhood, and loved her as though she had been his own daughter. John Upton had always doubted; and he resolved to watch over the fate of one whose interests he had always tried to guard. With a sad foreboding, he regarded Alice and her husband alternately. But ominous as his fears were, the reality far surpassed his worst suspicions. Alice had always been fond of Mr Upton, but now she avoided his kind and penetrating glance. She had invited him frequently to her house, and included him on this occasion more because she did not wish to omit him, than from any idea that he would really come. She was surprised to see him; and if he had known how keenly his fatherly manner towards her touched

the heart of the unhappy girl, he perhaps would have been less gushing in his greeting. But at last the entertainment ended :

The lights were fled, the garlands dead,  
And all the guests departed.

Mr Vivian and his wife were alone now; and in her ball-dress—such a mockery it seemed—she sat by him until another June morning shone brightly forth, corroborating the fatal particulars of the previous evening's information. They were ruined, utterly and completely !

It was only a nine days' wonder, and then it was forgotten, except by those who had lost money by it, and who in consequence heaped the strongest censure upon Charles Vivian. Fortune makes friends—ruin loses them; and when it became known that the Vivians were absolutely penniless, it was marvellous to note the change that came over their summer and self-constituted friends. It is useless to describe the ordeals through which the unfortunate Vivians had to go, and only painful to detail their departure from their luxurious home, which they quitted, of course, immediately.

Mr and Mrs Atwood did come to see them, but neither assistance nor even temporary shelter was offered; and during their visit, the unhappy Alice had to endure the most painful part of her trial, that of hearing her husband's conduct called in question, and terms applied to him in her presence to which no wife should be called upon to listen.

Late one afternoon, Mr Vivian and his wife set out upon a dreary quest for lodgings—very humble ones they would have to be, for their money was all lost. Only one little pittance could be relied on, and that was the despised one hundred and fifty pounds a year, which the wisdom and forethought of John Upton had secured beyond the probability of loss for the daughter of his old friend, Miles Annesley. To the north of London they went, and, after a fatiguing walk, for which Alice especially was little able, they decided upon an abode, whose principal recommendation consisted in its cheapness and cleanliness, in addition to the pleasant face of the landlady. The latter was evidently at a loss to imagine how two people of such apparent position could condescend to so humble a dwelling. However, after giving Mr Upton as their reference, they secured the rooms, and departed, promising to take possession on the following day. Their few remaining things were easily packed up; all their superfluities were left behind, to be sold; and, early the next morning, a cab conveyed them from the scene of their prosperity to the little lodging which, for a time at least, they would have to regard as their home. But if fortune had frowned on them, and friends had failed, the love which in brighter days had been precious, in no way diminished now; and the darker their prospects became, the more they seemed to become to each other.

Bitterly did Charles Vivian blame himself, and bitterly did he lament the irrevocable past; but he was a young man yet, and instead of giving himself up to despair, he, cheered by his wife, determined to do his utmost to procure employment of some kind, and by every effort to achieve, if not the wealth he had so madly perilled and lost, at

least an independence, which, for her sake, he felt he would think no labour too great or too hard, if he could in the end attain to it. But to want employment, and to get it, are two very different things, more especially for a man who has been unfortunate in business; and this he soon discovered. He called on many of his old friends, but the interviews were strangely cold and unsatisfactory. Even those who had received substantial assistance from him in his palmy days, now either ignored that fact or forgot it; and after expressing some words of conventional condolence, and regret that they had no influence, &c., he would take his departure, depressed and desponding, but resolved, nevertheless, not to be quite dismayed. The Atwoods assumed an attitude of righteous indignation, and stood aloof. Such a scandal—such monstrous behaviour had never been equalled—but Alice had chosen her lot, so she must stick to it. Neither she nor Fred would have anything more to do with such a scamp, proclaimed Mrs Atwood; and as Alice had indignantly refused to listen to the most unmeasured abuse of her husband, her natural outburst was instantly seized on by Mrs Atwood as an excuse for withdrawing from all acquaintance with her unfortunate sister.

Mr and Mrs Atwood left town shortly afterwards for Scarborough, *en route* for their shooting-lodge in Scotland, without a word of farewell to the sister for whom, in whose brighter days, they had professed so much affection. One friend only remained to the Vivians, one honest manly hand was held out to them in their adversity, and that hand was John Upton's. John Upton, the hard, uncompromising man of business, possessed, nevertheless, a warm heart, and though few guessed it from his rough exterior, still it existed, and for no one did it beat more faithfully than for the child of his boyhood's friend. He had never liked her marriage; the non-settlements had roused his suspicions; and during the few months of her fancied prosperity, he had never doubted that a crash would come sooner or later.

He resolved to watch well Charles Vivian's conduct now; and, from a hardly confessed dislike, Mr Upton became slowly but surely convinced that his misfortunes had proceeded more from the force of circumstances, and a most unprincipled partner, than from any other cause. Meanwhile, the little money Alice had got for her ornaments melted rapidly away, and, on calculating their daily expenses, they were horrified to find how soon their little store would be ended. How they were to exist until even the time when the payment of Alice's half-year's interest was due, neither knew; but that 'something would turn up,' neither doubted.

Nothing did turn up, however; and when November came, matters looked decidedly dreary for them. Mr Upton had done his best to hear of some suitable employment for Charles Vivian, but had not yet succeeded; and so despairing was the latter, that at length the former offered him a post as clerk in a very small office belonging to a Mr Andrews, a quiet plodding man of business, who was induced, after some persuasion from Mr Upton, to give the *ci-devant* wealthy banker a trial.

Bravely and well he bore his altered fortunes, and thankfully did he accept the only employment which it seemed possible for him to procure. The pay was small; still, it was a beginning, and

anything was better than nothing. He made the best of it to Alice, describing the ease of his duties, never alluding to the drudgery he went through; but she guessed it, from his pale and worn face, but what could she do? Alas! her hands were filled now, for, early in December, the birth of a child added to their expenses, and involved Alice in an occupation for which, in her weak and uncovered strength, she was little able.

But the baby throve in spite of its unprosperous surroundings, and though its future caused them anxiety, still the little 'Alice Annesley' became the sunbeam of their dingy home; and as months wore on, grew into a blue-eyed, fair-haired little cherub, the image, as John Upton could have told them, of what her mother had been before her.

A year passed slowly away; it was the season once more, but how changed for the Vivians! Charles Vivian might be seen wending his footsteps daily to Mr Andrews' office in shabby garments, returning towards evening to the home that held his earthly treasures—his wife and child. They had always a welcome which never failed to cheer his tired and aching heart.

They had a little house of their own now, as, with a baby, lodgings had been not only ten times more uncomfortable, but more expensive. It was but poorly furnished, but even necessary articles for it had been a heavy item at the time to defray out of their straitened means.

Often did Alice think of her rich sister, who, though revelling in luxuries, and living so near her, never by word or deed acknowledged her existence. Mrs Atwood did not know what poverty meant; she had no conscience; therefore, the claims of her kindred did not trouble her; and if, by chance, any one inquired after 'poor Mrs Vivian,' she shook her head ominously, and descanted upon Alice's base ingratitude to herself and Mr Atwood, which had precluded the possibility of further intercourse; and she would throw out vague hints infinitely damaging to the character of both her sister and her brother-in-law, which were instantly disseminated far and near as authentic facts, by those who heard them. Her heart was hard, very hard, for once she saw her sister, saw Alice shabbily dressed, and looking thin and ill, whilst she, child of the same parents, leaned back in her luxurious barouche, and, passing the pale wayfarer, looked the other way! Shocked and grieved, Alice reached home after the rencontre feeling more worn and exhausted than usual; her baby was fractions, and the day was overpoweringly hot. When the evening came, and her husband's welcome figure stood in the doorway, poor Alice, without rhyme or reason—so it seemed to him—threw herself into his arms, and relieved her feelings with a good cry. He proved a very efficient comforter, and by tea-time Alice was herself again. After that cheering meal was ended, they went out for a quiet stroll, which was the one pleasure they could have, for it cost nothing. What castle-buildings went on during those evening walks—what pieces of impossible good fortune they suggested as possibilities—what things they were to do, if ever they got rich again—and how differently they would spend their lives, poor souls! They cheered each other up with visions of what certainly seemed highly improbable events, until some more prosaic subject connected with

immediate contingencies dispelled their brilliant imaginings.

They saw little of Mr Upton now; he had been very busy lately, and though Charles called occasionally, Alice was too constantly with her baby to be able to leave it much; sometimes he sent them fruit, sometimes some game or other little delicacies, and on very rare and unexpected occasions, he visited them. He had been a hard-working man all his life, and even now, though he had passed the threescore and ten years allotted to him, did not relax from his business habits. He lived in a handsome house in Russell Square, solitary, and with apparently no interest in life beyond his chambers in Lincoln's Inn; occasionally he gave dinner-parties, and occasionally dined out; but there John Upton's gaieties ended. He was wonderfully punctual in his habits, and on his not making his usual appearance one morning at nine o'clock in the dining-room, where breakfast awaited him, his worthy old housekeeper became alarmed, and proceeded to his bedroom, where she was horror-stricken to find her master lying in his bed stone dead. 'Died from natural causes,' was the verdict at the inquest that followed; and a few days afterwards, in presence of a few friends—Charles Vivian amongst the number, and Mr Atwood, who 'cut' him without any hesitation—John Upton was laid in his last resting-place.

Who was his heir? Nobody knew; but it was supposed that the principal part of his property was willed away to different London charities—if a will existed. Doubts and surmises were speedily ended by Mr Wentworth, the lawyer who had now succeeded to Mr Upton's business, requesting the return of those who had gone to the funeral to Russell Square to hear the last wishes of their departed friend. By a singular fatality, the same carriage that conveyed Mr Vivian back to Russell Square also contained Frederick Atwood, who resolutely avoided giving the former the faintest sign of recognition. The drive soon ended, and very speedily the servants were summoned to join the assembled guests, to hear the contents of the will.

Mr Wentworth seated himself, and, with due formality, producing the document, proceeded without preamble to read the last will and testament of John Upton. Various legacies were left to his servants in amount, far beyond what they could have expected—and handsome sums to each of his executors, of which four were named. After that, the rest of his property, real and personal, he bequeathed without reserve to the daughters of his deceased friend, Miles Annesley—Clara Atwood and Alice Vivian, for their sole and separate use, free from the debts and engagements of their husbands; to be invested—and here followed many business-like and careful details—after which came the signature, witnessed and dated, in due form, one month after the date of Alice Vivian's marriage.

Mr Atwood's face was a study! Joy, impossible to be repressed, shone on every feature for a few moments. 'The amount!' he asked.

'There is a codicil,' replied Mr Wentworth ominously; and silence being restored, he proceeded to read. John Upton recalled the foregoing will as regarded the disposal of his property to the two daughters of his deceased friend, Miles Annesley, and added a codicil, desiring that the

whole of his property, real and personal, should be realised and invested, the legacies above only excepted, for the sole use and benefit of Alice Vivian, wife of Charles Vivian; a change which the deviser wished it to be known had been decided on by him in consequence of the unsisterly conduct which Mrs Atwood had displayed towards her sister, and which had come under the personal notice of himself, and whose prosperity rendered any addition from him unnecessary. Then came his signature, —also witnessed—in due form. A dead silence followed, broken again by Mr Wentworth, who, approaching Charles Vivian, shook him warmly by the hand. 'I must congratulate you, Mr Vivian, on so splendid a fortune coming to your wife!'

'Splendid fortune!' echoed Charles.

'Considerably over two hundred thousand pounds,' returned Mr Wentworth.

It was enough, and too much for Frederick Atwood. He waited to hear no more, but rushed off without the ceremony or civility of leave-taking, to tell his wife what she had done for herself. Of her rage and fury, it is needless to speak — or of the mutual recrimination that never ceased from that time forth between the angry and disappointed but justly punished pair.

Better only to follow Mr Vivian to the shabby little dwelling, whither he lost not an instant in returning, and where Alice awaited him, little dreaming of the marvellous tidings he was to bring. He drove back—a circumstance which surprised her; and as she watched him alight, the extreme pallor of his face made her fancy illness must have caused him to indulge in the unwonted luxury of a hansom.

'Alice, my wife, my darling, our troubles are over! Mr Upton has left his fortune to you—at the least, he has left you two hundred thousand pounds!'

Poor Alice had borne her reverses bravely, and when actual poverty had faced her, strengthened by her love for her husband, she had never utterly given way; but now, to hear of such a sudden, marvellous, and unexpected change in their prospects, was too much for her, and, to the infinite alarm and consternation of her husband, she fainted dead away. It was a happy waking for her; and of the evening that followed, only those who have suffered reverses, and recovered prosperity, can imagine the happiness. By mutual consent, the first year's income was cheerfully devoted to discharging, with interest, the unpaid claims against Mr Vivian, and at the end of that time, he stood once more a clear and independent man. If the money was in Alice's name, it in no way detracted from their happiness—they were too truly devoted to each other to have any feelings on that score, and their days of adversity had not been in vain, for they had made them feel an amount of pity and sympathy for others, which proved a blessing to many.

John Upton's money was not squandered in thankless and extravagant entertainments. The Vivians retired to a lovely place in Kent, where they spend their days now, doing good with a lavish hand, and enjoying, in happiness and moderation, the splendid fortune which had so unexpectedly become theirs. Shortly after their accession to it, a son was born, and in him the name of their benefactor lives again, for they called him 'John Upton Vivian.'

So, though no public charities were enriched by his death, and no newspaper record paraded the magnificent bequests of the departed solicitor, one family was raised to happiness and comfort by his means; and through them, many and many a poverty-stricken home has been cheered and gladdened, and many a desponding heart has had cause to bless the thought that prompted John Upton's Welcome Windfall.

#### ADDRESS TO A WIFE.

[THOMAS HAYNES BAYLY was in the early part of the present century a successful song-writer. His poems were greatly esteemed. Destined for the church, he studied for some time at Oxford, but ultimately came to depend chiefly on literature for support. His latter years were marked by misfortunes, under the pressure of which he addressed the following beautiful verses to his wife.]

Oh! hadst thou never shared my fate,  
More dark that fate would prove,  
My heart were truly desolate  
Without thy soothing love.

But thou hast suffered for my sake,  
Whilst this relief I found,  
Like fearless lips that strive to take  
The poison from a wound.

My fond affection thou hast seen,  
Then judge of my regret,  
To think more happy thou hadst been  
If we had never met!

And has that thought been shared by thee?  
Ah, no! that smiling cheek  
Proves more unchanging love for me  
Than laboured words could speak.

But there are true hearts which the sight  
Of sorrow summons forth;  
Though known in days of past delight,  
We know not half their worth.

How unlike some who have professed  
So much in Friendship's name,  
Yet calmly pause to think how best  
They may evade her claim.

But ah! from them to thee I turn,  
They'd make me loathe mankind,  
Far better lessons I may learn  
From thy more holy mind.

The love that gives a charm to home,  
I feel they cannot take:  
We'll pray for happier years to come,  
For one another's sake.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

## THE COFFIN QUESTION.

IN the famous Exhibition in Hyde Park in 1851, there was shewn, among other novelties of art, a tastefully and substantially made *slate coffin*! It came from somewhere in Wales, and was recommended for its durability and cheapness. While wooden coffins, as was said, were liable to perish, slate coffins would neither rot nor rust, and, at least, might very properly take the place of the costly leaden coffins that were employed for interment in vaults and churches. The inventor of this really pretty and excellently manufactured article was applauded for his ingenuity; but the idea did not take, and we remember seeing the pattern slate coffin undignifiedly knocking about in the wreck of the Exhibition. Nobody would have it as a gift. A mistake had been committed. The age of stone sarcophagi is past about two thousand years ago. With a few exceptional cases to be immediately mentioned, people do not wish imperishable coffins. What is for the most part wanted is something that, answering the purpose of decency, will gradually with its contents dissolve into dust and disappear.

Wherever, through pride or error of judgment, this principle of simplicity in sepulture is violated, nature takes its revenge. Churchyards and cemeteries become charged with pent-up masses of putrefaction, and the living are slain by unwholesome effluvia bursting from the graves of the dead. Nor is this blunder committed by the uneducated classes. Westminster Abbey is ceremoniously made a receptacle for festering mortal remains denied the privilege of resolving into mother earth. Crowds kneel down in worship over a stratum of what would horrify them to look at. A similar blunder in degree is evidenced in the growing practice of public interment in strongly constructed oak coffins, warranted not to decay for a long period of years. Affection may resort to these expedients with the view of protracting the dissolution of the human frame, but any such prolongation is in point of fact a posthumous cruelty—an outrage on the rights of the dead, who, high and

low, put forth the silent but paramount claim to be allowed to dissolve into the earth out of which they were created. A very little consideration would shew that not only common decency but science is repugnant to all unnecessarily prolonged processes of mortal dissolution. The decaying body is partly composed of gases which possess a remarkable tendency to be transmuted into the elements of vegetable life; the earth being the vehicle for carrying them harmlessly away, and so sending them off on a fresh round of active existence. The greatest of English poets was aware of this beneficial change of substance:

Lay her? the earth;  
And from her fair and unpolluted flesh  
May violets spring!

Scandalised by the overcrowded and insalubrious condition of graveyards, Sir Henry Thompson, an eminent surgeon in London, has proposed to substitute cremation, or burning in funeral piles, for ordinary burial. No doubt, this would be an effective remedy for a crying grievance, but it does not commend itself either to the traditions of society or to our feelings, and need hardly be discussed. We feel sure the public will not have it. Mr Francis Seymour Haden, another surgeon in London, comes nearer to what is wanted, by proposing the introduction of coffins of wicker-work, so slender and pervious to the surrounding earth as to offer no obstruction to the rapid conversion of dissolving remains. His views as to the necessity for some such change in burial customs have been made so widely known by letters in the *Times* as not to require full repetition here. As a stimulus to doing something, he gives his experience of a London churchyard: 'In 1868,' he says, 'I was permitted to visit the burial-ground of St Andrew's, Holborn, then, with its contents, in course of removal to make way for the new Viaduct. The ground about the church had become raised fifteen or eighteen feet above its original level, and perpendicular sections had been made in it, here and there, from its surface to a depth varying from ten to thirty feet or more.

The face of these sections represented the interments of three centuries and a half. All the burials, except those in the Plague-pit and one or two others to be presently mentioned, had been made in wooden or leaden coffins, some of which were still intact, and some broken in. Little difference, as to condition, could be perceived between the coffins of Charles II.'s time and those recently used, or between the coffins which were of lead and those which were of wood. In the coffins which were intact were their contents, also intact, but putrid, unrecognisable. In those which had been broken in, nothing was to be found but a little ordinary earth, corresponding possibly to the solid constituents of the body which it had replaced, and, occasionally, not always, a few bones. Nothing more. The body itself had disappeared, and "earth to earth" had been accomplished. Here and there, in other parts of the ground, were graves lined with brick and filled with water, in which the coffins of those who had been buried in peculiar honour still floated, some head, some feet uppermost, as their gaseous contents determined. Here, again, a few fetters indicated the spot where some evil-doer had undergone what was intended, no doubt, to be the last sentence of degradation, but whose poor body, having had the advantage of being buried without a coffin, had disappeared—as had also, for the same reason, the tenants of the Plague-pit. The whole tangible remaining mass, consisting of several thousand bodies, was removed, night by night, to Ilford, where it now lies in a pleasant garden, and the new Rectory House of St Andrew's stands upon the restored level.

It is always convenient to find a scapegoat for any popular error. In the matter of burials, the undertaker is selected to bear the blame of much that is foolish and extravagant. We would not uphold that undertakers are paragons of virtue, but surely they are too indiscriminately abused. Like any other class of tradesmen, they only do what they are told according to prevalent prejudices and fashions. If there be anything to complain of, the remedy lies with employers, who have only to exercise a proper discretion in giving orders. Obviously, there is a fashion in coffins, as there is in houses or articles of attire. Not long ago, a deal coffin covered with black cloth and decorated with plated mountings, was deemed to be 'respectable,' and altogether satisfactory. Latterly, in the progress of wealth and assumptions of dignity, the fashion is to have a very solid kind of coffin of polished oak, with a lavish display of antique-looking brass ornaments. Then, when lowered into the ground, this elegant article—a twenty-guinea affair—is saved from the rude contact of earth by placing over it a species of black mattress. Now, will any one say that all this is not done at the request, or with the tacit sanction of employers? Let us 'put the saddle on the right horse.' It is the public who are to blame for such follies, not the undertakers; though no doubt these

gentlemen are as readily disposed to run up a bill as any fashionable tailor or milliner. We know as a fact that the widow of a friend of ours lately deceased, gave an express order to furnish a handsome oak coffin with white satin lining and pillow for her husband; her affection having blinded her to the folly and extravagance of the procedure. She was apparently unconscious that her mistaken kindness would have the sorrowful effect of denying to the remains of her husband the prerogative of speedily entering into union with the earth from which they sprung.

Mr Haden contends that any form of solid wood is unfit for the construction of coffins, because most kinds of timber are nearly indestructible—some of them at least being in pretty good condition, as was the case at Holborn, after burial for two centuries. As regards entombment in 'our glorious Abbey, all that is necessary in such cases is that a certain period—a year or more—should be allowed to elapse between the death and the final entombment, during which time the body should lie embedded in charcoal, in a crypt to which the air has free ingress. A shrine of fine open metal-work, such as that which surrounds the tomb of Henry VII. at Westminster, would answer admirably as the containing vessel for this charcoal, and the wicker coffin and its tenant (for, in such cases, coffins which are open on all sides must still be used) would lie unseen in the midst of it. On the anniversary of the death—supposing that to be the day selected for the final obsequies—this coffin, without being opened or its contents in any way disturbed, may be lifted out and transferred to its sepulchre. Its loss of weight will proclaim at once what has happened to the body within it. Except the bones, which, after all, are what we really wish to honour, it will have disappeared. The charcoal, or rather the oxygen, within its cells, will have done its work and all that was perishable and vile of that body will have passed insensibly and inoffensively into the atmosphere.

The sum and substance of the whole matter is, that in ordinary burial the decaying body should be brought as closely in contact as possible to the earth in which it is laid. Objecting to the obstructive properties of wooden coffins, Mr Haden, as has been mentioned, proposes to employ wicker cases, which would allow the escape of gases into the earth, and be quickly decomposed. To the use of these wicker coffins there occurs the serious objection, that often, to prevent infection, there is a necessity for using coffins rigorously sealed up from the atmosphere. We believe Mr Haden designs to get over this difficulty by introducing charcoal and other disinfectants, and he also counsels expeditious interment. By the courtesy of the Duke of Sutherland, he was allowed to exhibit a few model coffins of wicker-work in the garden of Stafford House, where a large and select party attended by special invitation. A lady of literary attainments, wife of a London physician, gives us the following account of this interesting assemblage, which she styles 'A Coffin Party.'

'On Thursday the 17th of June, in the midst of fashionable equipages, we drove up to the garden entrance of Stafford House, and on presenting our cards to the policeman at the door, were requested to enter and "move on." With this order we found it most difficult to comply, in consequence of the large concourse of persons streaming in and out of the inclosure. On the whole, the departing public expressed satisfaction with the arrangements they had witnessed for their future interment. At length, on reaching the terrace, we found ourselves in the midst of a curious and novel scene. Wicker coffins, of the well-known shape, lay on the ground, objects of the most lively interest. The Duke of Sutherland and Mr Seymour Haden formed the nucleus of groups of eager and intelligent inquirers. Members of the press found occupation for their note-books; while "our artist" of the *Illustrated News* stood upon the top step of the terrace sketching a coffin, amidst the throng of onlookers. I noticed that a group of women in black, not far off, were weeping with painful emotions. Here, then, were brought together by a common interest hundreds of people in different social positions. No doubt, many of those charming women whom we saw about us had taken the coffins on their way to five o'clock teas, or *en route* to an afternoon concert, or another garden-party; hence the scene was anything but the dismal, but rather partook of the gay. The basket-coffins were of various sizes, and apparently of sufficient strength, but with that openness of structure considered requisite. One of the baskets was of closer texture, and double in its framework, with a space of three inches between the outer and inner parts, to be filled with charcoal, to arrest effluvia and serve as a disinfectant. Some of the baskets were ornamental in character, with neatly arranged mossy linings. I should mention, however, that Mr Seymour Haden did not greatly approve of the mossy idealities, but prefers the more open receptacles, as admitting almost literally "earth to earth." Neither did he speak approvingly of the pretty baby-baskets of black and gold, or pale gray, that lay open within another; the more plain and unvarnished the better for carrying out nature's intention. Anyway, by this simple method of burial, we have the happy assurance that in the transmutation of our bodies we are not leaving a legacy of disease to the living; nor are those who piously visit burying-grounds liable to have their senses nauseated. At certain periods of the year, tender recollections lead me on a pilgrimage to a cemetery in the environs of London. On arriving at the sacred and beautifully situated spot, I would gladly linger; but the sickening odour issuing from the gratings of the vaults beneath, drives me forth with sensations of horror, at the association of ideas to which it gives rise. To be spared this, with the knowledge that all offensive gases are being absorbed, that resolution takes the place of corruption, and that we are acting in accordance with Nature's laws, would be the kindest means of hallowing the graves, and of enabling the living to indulge in fond memories under the weeping willow. On sanitary grounds, it behoves the inhabitants of the metropolis, in particular, to look present dangers in the face. This vast city is compassed on the north and north-west by a mass of corruption, over which the most prevalent winds pass before they sweep our dwellings, and taint the

atmosphere we breathe; bringing it may be disease and death from the dead to the living. As so far calculated to avert dangers of this kind, I cannot but look with satisfaction on such plans of interment as are proposed by Mr Seymour Haden.'

In a matter of this kind, with fashions and prejudices to overcome, it can hardly be expected that Mr Haden's proposal to substitute wicker for wooden coffins will meet with general acceptance. Explanations on the subject, however, will do good. Some middle course may be found sufficient to meet general requirements—for example, the covering of the wicker cases with a thin black textile fabric, which would give the external appearance of ordinary coffins, and would not seriously obstruct the operation of the natural laws. A few persons whose opinions carry weight with the public, might come to a common resolution to encourage the practice now so strenuously recommended, and the sound principle of which is beyond dispute. Possibly, we may hear of a salutary movement of this kind among the more intelligent classes of society. W. C.

## STEPHEN BELL, THE USHER.

### IN EIGHT CHAPTERS.—CHAPTER VI.

THE appearance of the usher at this late hour—not very late when measured by London habits, as it was only nine o'clock—astonished the inmates of Hanover House, but not half so much as did his announcement that he had come to take Alfred Rainwood away for the night. It was impossible; the little fellow had just gone up-stairs to bed; and, besides, what would Mrs Garney say? Bell cut short these remonstrances by pushing back their utterer, the cook, and hurrying with familiar step to the room where little Alfred slept. The boy was half-undressed, but on hearing the usher's voice he uttered a cry of delight, and sprang to him. Bell, for the first time, caught him in his arms, and pressed him close to his breast, kissing him repeatedly. 'But, my dear boy,' he said, relaxing his hold, 'I have much to do to-night, and so, for a little fellow, have you. You are to sleep at the lodge; yes, indeed; so dress yourself at once, and come with me quickly, for I have hundreds of miles to ride to-night.'

The boy, always docile and obedient, complied, although evidently wondering very much at the command; and the usher led him down-stairs, passing the three servants, who had gathered together in the passage to protest against this proceeding; but the stern face of the usher cowed them, and they shrank aside to let him pass with Alfred. The servants did not even know where the child was going, and Bell muttered below his breath: 'It is well that he is moved; any ruffian could have taken him away as easily.' They arrived at the lodge, where poor Alfred, very tired and very sleepy, was glad to be taken in charge by Miss Lamsett, who was there as kind and gentle as ever. There, too, was old Lamsett, very much disturbed by these 'goings-on,' as he called them, yet possessed of such perfect confidence in Tremlee and the usher, that he asked for no further

information; and there, too, was a tall, fresh-coloured young man, who was introduced to Mr Bell as Dick Willand, the recruit from the Hall.

'I have packed up one or two little things which I thought might prove useful to you on the journey,' said Priscilla, producing a small leather bag.

'Yes,' said the clerk, who was also at the lodge; 'Pris has a capital idea of the commissariat. I told her not to put anything to drink in the bag, for it was large enough already, and we should hardly need it, as we can each carry a flask in our pockets. Here is yours; here is mine; and here is one for you, Mr Dick; and now we are ready.'

A hasty farewell was taken, and a hurried charge given to the keeper in reference to Alfred, to which the old man replied with one of his emphatic declarations.

'He shan't be out of my sight, Mr Bell, day nor night, till you come back; and though old Wat Lamsett is old, no mistake, he'd no more mind putting a charge of swan-shot into any fellow as meddled with anything in his care, or loosing Brimstone and Fury upon him, than he'd mind eating his dinner.'

The old fellow's determined character rendered his declaration extremely reliable; so, wringing his hand, with a word of thanks, Bell hurried off. The party called at his lodgings for some extra rugs, of which he had a supply, 'recently laid in,' as he observed to Trenlee, with a smile; and Dick was provided with a good oaken cudgel of the most serviceable character. Mr Trenlee declined the offer of a similar implement, remarking that his business lay with less irregular weapons, and that he would transact the getting a warrant, or making a declaration for them, when they went to a magistrate. Dick Willand noticed that the usher gave a very peculiar smile upon hearing this, and Dick noticed further that he carried a life-preserver. They were just in time to catch the last train, and, to the surprise of Dick, first-class tickets for the three were obtained. They were in a compartment by themselves, and as the train moved on, Bell said: 'Now, let us have supper at once, and then go to sleep. We ought to be able to sleep as comfortably here as in a feather-bed, and we shall need it, for we have a two-hundred-and-fifty-mile ride before us, and a busy day to-morrow.' He set the example as he finished, by producing Priscilla's basket; the flasks which had been Mr Trenlee's special care were also brought out; and in half an hour, each one, coiled up in his own corner, slept, or seemed to sleep.

A little after midnight, they stopped at a very celebrated station, and, in common with most of the passengers, Bell and his companions left their carriages, and walked up and down the platform, to stretch their legs. In thus walking, they passed and repassed two tall, hard-featured men, who wore each an aspect very much akin to that by which we recognise policemen in private clothes; the idea being strengthened by the square build and the tightly buttoned coats. Mr Trenlee seemed very much attracted by these two men, whom he had noticed leave a second-class carriage; and, uttering some unintelligible excuse, he left Bell abruptly, and, to the surprise of the latter, entered the very carriage the men had left; the men, by-the-by, were then at the farther end

of the platform. Ere Bell could go up and ask him if he had mistaken the carriage, the old clerk emerged, and had quitted the vicinity of the coach before its legitimate occupants returned. At this moment the bell began to ring, the passengers resumed their seats, and the train moved on.

'I daresay you wondered why I went into that carriage,' said Trenlee, when they were fairly out of the station.

'I did, very much,' replied Bell; 'but I suppose you had some reason.'

'You are right,' said the old gentleman; 'I never had a better reason for doing anything in all my life. You know I told you that they were going to remove Mrs Maylis at once; well, I felt convinced, from the look of those two men—you know which men I mean; big, close-shaved fellows, who stalked up and down like policemen'—

'Yes, I remember them well,' said Bell, 'and I saw that you noticed them very closely.'

'I was convinced,' continued Trenlee, 'the moment I saw them, that they were the keepers, and I am as sure of it now as I wish to be. I had observed the carriage they left, and when I entered it I found their carpet-bags were marked for Rittle station. I know Rittle, as I have told you, very well; it is but a small place, and few houses scattered round it. The chances are, therefore, a thousand to one that these men are on the same errand, pretty nearly, as ourselves.'

'I don't care if they are,' said the usher; 'twenty such would not stop me.'

'O dear, no!' exclaimed Trenlee; 'nor is it likely, I should fancy, that anything like open resistance would be ventured on, if there were a hundred. Nevertheless, the presence of these fellows makes it a little more awkward.'

Bell made no reply; but, pulling his travelling-cap somewhat more tightly over his brows, sank into a silence which might have passed for slumber, save for an occasional frown, or a closer clenching of the lips.

The short July night was soon spent, the dawn came, and then bright day; but it was near ten o'clock when—having changed carriages once at a quiet little junction, where Trenlee, who, spite of his age and his spectacles, was like a hawk in watchfulness, saw the two tall men also get into the branch train—they alighted at the unfrequented station which was their goal. Here Trenlee pointed to a large house standing by itself on a low hill some half a mile away, and said: 'That is the house, Mr Bell; we shall pass just beneath it on our way to the village. What a wild spot, to be sure! Come along; we shall find a magistrate at home, I have no doubt.'

As they stood at the gate of the little station, the two men already referred to came out, each carrying his carpet-bag, and looking around him with the air of a stranger seeking some mark by which to guide his steps. Trenlee, as his companions could see, purposely threw himself in their way; but although the men looked as if they would have spoken, they did not; and so, with an old-fashioned bow, the clerk said: 'You will excuse me, gentlemen, but I see you are strangers. You are probably looking for the village of Rittle; if you take the road to the left'—

'Well, sir, I am much obliged to you,' said one of the men; 'but we are not looking for the village. I was directed to a place called Briar

House, and I fancied it was close to the station, but I suppose there's some mistake.'

'Briar House?' said Trenlee, with a reflective air. 'To be sure; you mean Mr Purvis's?'

'Yes, that's the name,' replied the other; adding in a lower tone, to his comrade: 'We're right enough now.'

'Come down the steps here, and I will direct you. You see that house on the brow there,' said Trenlee, pointing to one about two miles away; 'if you go there, and follow the path on the other side, into the hollow, any one will shew you Briar House.'

'But I thought it was close by,' said the man, who looked very blank when the distant knoll was pointed out, 'and that it was on the top of a hill, not down in a hollow.'

'Aha!' laughed Trenlee; 'we call that close by, in Yorkshire—a mile or so is nothing here, but the house is not down in a hollow—O no!'

'We'd better have a coach, mate,' said the man, turning to his companion.

'Much better not,' interposed Trenlee; 'the path across the heath will take you in less time. It is a long way round by the road.'

The second man muttered something about 'costing a matter of half a sov. for a fly;' and then, nodding their acknowledgments, they strode off.

Trenlee watched them with a complacent smile for a few seconds before he said: 'It is as well to have them out of the way, after all. They had better come, if they come at all, when we have had our innings.'

'But may you not have been sending a couple of harmless graziers or farmers on a fool's errand?' said Bell, who had heard very little of the conversation. 'If they really are the men you suppose, I of course would not mind telling them any fiction to send them off—but if they are not?'

'But they are, my dear sir, they are,' said Trenlee. 'I could swear to their trade. It is a trade which above all others requires kindly natures and forbearing tempers, but generally gets quite the reverse; and these fellows are the worst I ever saw. But, come; we have now to reach Rittle.'

Ere they had gone twenty yards, however, Bell exclaimed that he had forgotten to give some directions about the luggage, and at once ran back to the station. In lieu of speaking to a porter, he called the driver of the solitary fly who found it worth while to attend the arrival of the trains, and who, seeing no chance of obtaining a fare, was just mounting to drive away; to him Bell spoke, gave him a few directions and a piece of silver; the man nodded assent, and Bell in a few strides regained his comrades.

Their path towards the village led them across a wild unsheltered moor, pleasant enough this summer-time, when the soft breeze was blowing over its wide expanse, unbroken—save by a few isolated knolls such as that whereon Briar House stood—by hill or dale, house or barn; but in winter, when the north wind howled over its surface, it must have been a dreary place indeed; a dreary enough place in which to hide away any one whose seclusion was deemed desirable. So thought and said Mr Trenlee as they walked briskly towards the village. The straggling houses of the latter were now at hand; but ere they reached the nearest, a footpath struck off across

the common, leading evidently to Briar House, which was accessible either to foot-passengers or vehicles from the roadside just there, as heath and road were nearly on a level where they joined.

'Here we are; this way,' said Bell, who had spoken but little, and he turned to the by-path.

'No, no, my dear sir; you are too hasty; out of order altogether,' exclaimed Mr Trenlee. 'Our first aim must be to see a magistrate and state our case; and I have no doubt he will accompany us to the house, and insist on the production of the alleged lunatic, Mrs Mary Robinson. That is it, you perceive.'

'I perceive this,' returned Bell, 'that we shall shilly-shally about the village until some one from the house sees us, and guesses our errand, or your two friends have finished their walk, when they may forestall us as their suspicions will be excited, and we shall find the bird flown. No, Mr Trenlee; in most cases I should prefer your guidance; here I trust to myself. I will insure that we see Mrs Robinson, or whatever name they choose to give the patient.'

'O nonsense! this is getting too serious,' said Trenlee, who saw how much in earnest his companion was. 'A false step may ruin all, and we must have the law on our side, we really must, Mr Bell.'

'We shall have as much law with us as they will have with them,' said the usher; 'besides, we may even now have been seen from the windows of the house, and our errand guessed. Unless we are too quick for them, they may be too quick for us. In short, Mr Trenlee, if we don't meet Prior there, Dick and I are going as the new keepers, you see, and you are a friend. Come, sir.—Come, Willand.'

So, without more words, Bell turned into the footpath, followed promptly by Dick, whose face bore a grin of anticipation at the possibility of a fray; and more slowly by Trenlee, who, while he could not approve of the idea, and thought that in the event of a discovery, some desperate measures might be resorted to, nevertheless did not wish to remain behind, and thought also that his presence might avert the violence he dreaded.

Bell's conjecture was right. They had been seen from the windows, and by very dangerous eyes, as a brief explanation will shew.

The keeper of Briar House, who was as ill-looking a fellow as ever lent himself to a piece of rascality, had been surprised on the previous night by a visit from his employer or employer's agent; he did not know which he was; he only knew his name was Prior.

'Now, Purvis,' said he, immediately on his arrival, 'I must move your patient. This place is too exposed; she must go farther away.'

'It's answered very well as yet,' growled Purvis. 'What's the matter with it now?'

'Why, this escape to be sure,' said Prior: 'twice she has got out of your grounds, and we are so close to a village, that it is a wonder she did not meet any of the people. You are sure no one saw her this time?'

'Dead sure,' said the man; 'that's all right enough. One of the dogs had her in a jiffy. My missis guessed what was up directly she heard me a-swearin'. I did swear, too, when I found her room empty; so, without waiting for inquiries, my missis runs into the yard, and unchains both

the dogs. The young woman is always awful afraid of them, and don't hardly like to look at 'em. She was caught beautiful! but if I hadn't luckily took the same path, you'd have had a inquest by this time. Leastways, I don't know,' the man added thoughtfully, 'as there would have been any occasion for such a thing. There's always a lot of trouble about 'em.'

'Is she hurt?' asked Prior.

'Well, not particular,' returned Purvis; 'there's just a graze on her shoulder where the dog seized her, for she was a-crouching under a hedge, I believe; but there ain't much the matter. Will you come and see her?'

'No, no!' said Prior, waving his hand as though he thrust the idea from him; 'it's very late, and you know I hate the sight of her. But, hang it! I must do it to-morrow, I suppose, for I can't trust to anybody but myself to see all right.'

'What was you a-going to do about the moving of her?' asked Purvis; and he looked more sullen than before when he broached this topic.

'She must leave here—at once,' returned Prior; 'I have been to, blame in letting her stay here so long. I have heard of a very safe place on the coast of Ireland, and there I intend she shall go.'

'Am I to go with her?' said Purvis, 'because I must talk it over with my missis first.'

'Well, no,' said Prior; 'I think not. I want total strangers, you see, Purvis.'

'Oh, I know what you want,' interrupted the man; 'and you could have had it just as well here as in Ireland, as you call it, which is quite as likely to be Scotland. However, that's neither here nor there. I have had plenty of hints from you, but you have never been the man to say: "Bill Purvis, here's enough coin to make it worth your while to do the job and step it." No, governor; you want it done for nothing.'

'Well, that is enough about what you think,' said Prior, to whom this conversation was, of course, terribly unpalatable. 'I am aware that I must pay you a long notice, and I will; I will also try to get you another situation.'

'Oh, don't you take no trouble about that,' replied the other; 'we can always get berths in our line; I daresay I can go back to the party I was with in London afore I came to you. You needn't give yourself no airs, neither, about paying us, because, of course, me and my missis means to be paid for holding our tongues.'

'And pray, what have you been paid for all this time?' exclaimed Prior, whose anger began to be excited.

'Me and my missis,' pursued the keeper, 'was a-talking about you only last week, and she says: "Bill," she says, "that Prior, or Noakes, or Styles, or whatever his name is, will serve you a dirty trick at last; you see if he don't."'

'The question is,' said Prior, choking down his passion as well as he could, 'how much do you want? What will satisfy you?'

'That is the question,' grinned the man; 'and if you do what's right, we shall part good friends after all. I shall be glad to get away from this deadem-alive place, and so will my missis. However, I'll call her up.'

His helpmate was accordingly summoned; and as Prior appeared willing to pay what even their greed demanded, they grew more civil, and entered readily into his plans. These were more matured

than the keeper expected to hear, for he had not only decided where the patient should go, but had had in readiness for some time—although he did not mention this to his hearers—the men who would go with her, and they were to arrive at Rattle on the morrow. Prior would sleep at Briar House that night, and await their arrival; then by the first convenient train they would take the patient to Liverpool, and so on to Ireland.

'And if more than two ever comes back, Bill,' said Mrs Purvis to her husband, but not in so low a tone as to escape Prior's hearing, 'this party is more of a fool than I take him to be.'

Purvis nodded, but did not speak in return, and Prior went on. The keeper and his wife would remain at Briar House a little longer, to keep up the belief that Mrs Robinson was still there, and every precaution would be taken to prevent her being recognised at the station; then, after a few weeks, Mr and Mrs Purvis might go where they pleased. In the safe retreat to which the patient would be conveyed, there would be no need of any schemes to hoodwink intrusive commissioners. This plan being discussed and agreed upon, Prior, although it was midnight, gave orders for his supper to be got ready, and while it was being prepared, he sauntered on to the heath, the conversation of Purvis not being much to his taste. While he strolled about apparently at his ease, and quite carelessly, he in reality was specially cautious so to walk as never to come within range of the windows on a particular front of the house. 'Confound her! middle day or middle night, she would certainly be looking out at that moment,' he muttered; 'and although I might not see her, it would be almost worse to feel she was looking at me. I would rather pay a good sum than see her to-morrow; but I must do it. Why isn't she dead?' As this very natural question crossed his mind, he approached the kennels of the two savage hounds which were kept to guard the premises. As he drew nigh, the powerful brutes came as far towards him as their chains would allow, and growled fiercely at the stranger. 'A man might almost as well have a tiger upon him,' thought Prior; 'and as for a woman! If Purvis had been but two minutes later'—He lingered for a few minutes ere he re-entered the house, following up this train of thought with all its attendant visions, and rousing himself with a sigh to think they were not real.

In the morning there had been a brief consultation between Prior and the keeper, having relation, it would seem, to the packing of certain boxes for the use of the patient; two or three of these, labelled with a different name from that by which the lady had been known, were brought into the hall, and then Prior had disappeared until the morning was pretty well advanced. On his return he summoned the keeper. 'Now, Purvis,' he said, when the man came in, 'everything had better be ready for the new attendants'—

'Everything is,' interrupted Purvis gruffly.

'That is well,' continued Prior; 'for they will be here either by the train which is nearly due, or by the one following. I will settle with you at once, for when I leave here, I don't know how long it may be before we meet again.'

Purvis grinned, but whether from pleasure at finding he was about to be paid, or as a sarcasm at the idea of his employer ever voluntarily seeing

him again, the morose expression of his features rendered it impossible to say. 'I'll call my missis,' he said, as he nearly always did say when there was any difficulty to be encountered; 'she knows what is right about receipts and things.'

Mrs Purvis was accordingly called; and as it luckily happened that the receipt drawn out by Prior suited her critical judgment, the business was speedily settled, and the cheque handed to her safe keeping.

'Does—does she know she is going away to-day?' asked Prior.

'No,' said Purvis; 'she don't. I thought she would make such a row if we told her; but if you did, there would be no help for her, and that she knows. Not as I mind her noise, only, as she is agoing on the rail, I thought we wouldn't upset her. So you had better go up, as there don't seem no time to spare.'

Prior frowned at this suggestion, but after a moment's reflection said: 'Well, if I must, I must. I will go now. You will be within call, Purvis, as we are never quite safe with insane people.'

Purvis grinned; and his employer turned to leave the room, but as he did so, the latter exclaimed: 'Why, there are the men, I believe. I can see two strangers coming from the station. No; there is a third; and surely there would not be three.—Do you recognise these persons, Purvis?'

The keeper looked for a moment, then shook his head. 'They are none of the folks about here,' he said. 'If they are the men you expect, you ought to know 'em when you see 'em.'

'I never saw them,' returned Prior; 'I engaged them from their principal; but it must be them; let me know when they arrive.'

Leaving the keeper, he went slowly up the broad stairs, until he reached the landing. Here he listened for a moment, but all was silent; he rapped at a door, and a voice, calm and quiet enough, bade him enter. He complied, and a pale-faced woman, who was sitting by the window at the further side of the room, half rose as the door opened. She was a tall, slender woman; evidently young, but yet with many a thread of silver in her brown hair; and yet so colourless were her features, that her hair looked almost black by the contrast with them. She had large eyes, in which no irregular fire of madness gleamed, but they were solemn and melancholy eyes; and, indeed, an air of sadness tinged her whole being. She sat, as has been said, near the window, where bars within and bars without gave a prison-like air to the well-furnished room, and effectually secured its inmate.

'The doctors have decided that you require a change of air,' said Prior. At the first sound of his voice she seemed to shudder and shrink from him, but by an effort she regained her composure. 'So, in the hope of restoring you, I have consented that you shall leave this place. You go, therefore, to-day.'

The woman's lip trembled, as though she could scarcely frame her words, but she said with a measured utterance: 'Have you at last made up your mind to murder me? I have daily expected to meet my doom by poison or violence; has it come now?'

'How painful it is to find you persist in suspecting all those who wish you well!' said Prior; 'it is dreadful to hear you. I was sorry also to

find that you had made another attempt to escape. Why, Katharine, can you not be calmer?'

'Calmer!' exclaimed the woman, if her subdued and guarded tone could be called an exclamation; 'how rejoiced you would be, did you find me less calm; could you but see that under your persecution my mind was indeed giving way. But in your presence, though stung by the sight of you—dastard and villain!--I can always be calm. Look well, nevertheless, to your guards, your cords, and your gags, upon the road, for I am desperate now. I know you mean to remove the chief obstacle from your path, and but for some reason of your own, you would have done it in this house. So look well to your guards, I say.'

Prior glanced, half involuntarily, behind him, to assure himself that the door was open, in case of a retreat being necessary. 'You warn me in time, madam,' he retorted; 'if I had entertained any idea of trusting you before, you have altered my plans now. You are going, madam, to a place where your keepers will, I trust, be more vigilant; and where jagged rocks and stormy waves offer less facilities for your rambles, than does this heath. And I believe I may say that this will be the last time I shall inflict my company upon you.'

He paused, but she made no reply; she only looked at him with her large ghostly eyes; their steady gaze discomposed him, and he sought to cover his uneasiness by speaking. 'I think, madam, I hear voices below which tell me that your escort has arrived, and as you are obstinately set against all kindness, I leave you to them.' As he ceased, a tap was heard at the door, and Purvis, from the outside, explained that 'the parties had come, and was waiting.'

## THE EAST INDIA MUSEUM.

THE East India Company, whose brilliant and useful existence came to an end shortly after the Sepoy War, consequent on the Mutiny of 1857, had its official home in Leadenhall Street. There the India House, now numbered among the things of the past, had amongst its many rooms a few which were set apart for the reception of curiosities pertaining in some way or other to our great empire in the East. In some cases, the civil and military servants of the Company collected the specimens, brought them home, and placed them at the disposal of the directors; in other cases, native princes presented beautiful specimens of arms, armour, brocades and embroideries, gold and silver tissues, and other valuables; while, in another class of instances, war-trophies were brought home as spoil by the conquering armies of the Company. The assemblage of articles was a jumble of odds and ends until Dr Harsfield, in or about 1798, was appointed curator, and empowered to organise them into a museum. Sir Thomas Raffles and Dr Wallich aided him in obtaining specimens of the chief vegetable growths of India known to be applicable to useful purposes—not living plants, but seeds, roots, bulbs, leaves, stems, pods, nuts, berries, flowers, grasses, fibres, farinas, sugars, and veneers cut from large timber trees. The Medical Department of the India Service rendered great assistance in this matter, bringing a study of botany to bear upon the subject of *materia medica*. Zoology was also brought into requisition, not merely by

obtaining stuffed specimens of Indian birds and quadrupeds, but also by bringing together illustrations of animals and animal substances useful in the arts.

The collection at the India House was rather heterogeneous, and those of us who are old enough to remember the place and its belongings, will have a sufficient recollection of the unsuitableness of the building for displaying the articles exhibited. Half-a-dozen rooms and corridors, not originally intended for the purpose, and very dimly lighted, were far from being attractive to visitors, and equally far from satisfactory to the curator for the time being. Nor was the arrangement so systematic as might have been the case under more favourable circumstances. Works of art in painting, drawing, mosaic, enamel, inlay, ivory, carved wood, and engraved stones; articles of personal adornment in diamonds, pearls, gems, gold, silver, and filigree; rich dresses, and materials for dresses, in silks, brocades, tissues, and muslins; spun and woven silks and woollens, linens and cottons for curtains, hangings, tents, canopies, carpets, and rugs— all these were mingled in some confusion with a multitude of objects, natural and artificial, useful and ornamental, as the case might be. Conspicuous among them all was Tippoo's tiger, a remarkable illustration of the conjunction of the barbaric with the splendid among orientals. After the defeat of Tippoo Saib by the Company's troops at Seringapatam in 1794, there was found in his palace a carved figure of a tiger, spotted and coloured in due form; the animal was represented as crouching over the prostrate form of an English soldier, biting and clawing him; within the body of the tiger was a kind of barrel-organ, comprising pipes and bellows; when wound up by turning a key, two sets of sounds were heard, one like the roaring and growling of a tiger, the other like the screams and groans of a man. This was one of the delectable amusements of Tippoo; as sultan of Mysore, he caused the mechanism to be put in action, in order that he might enjoy the sight of mimic tearing and clawing, and the sounds of mimic brute-roaring and human suffering.

When the imperial government succeeded to the Company, and the India House was pulled down, the museum found a temporary home at Fife House, Whitehall. Here the collection was augmented from time to time under the care of Dr Forbes Watson, who had become curator. There was also created for him the office of Reporter on the Products of India. The government had become impressed with the importance of developing by every reasonable means the resources of the Queen's magnificent empire in the East. It is known, for instance, that India produces a large variety of vegetable fibres, applicable to the manufacture of textile goods, paper, and cordage; and it was a matter of practical value to ascertain at what prices such fibres, whether cultivated in fields or gathered wild, could be purchasable in England. The late Dr Royle, the able predecessor of Dr Forbes Watson as curator of the museum, rendered essential service in this matter. At the great International Exhibitions which he lived to see inaugurated, he brought together a very complete collection of Indian fibres; and in a published treatise on the subject he set forth in an exhaustive manner the qualities of all the fibres. He classified them according as they are obtained

from the stalks, leaves or leaflets, bark, roots or rootlets, or seed-pods of plants; specified the provinces in which they grow, the mode of culture and of gathering, the strength of individual fibres, and the monetary value in India; and afforded English manufacturers some means of judging for what purposes the fibres are severally suitable, and at what prices they could reach London or Liverpool after defraying the charges for freight. So, in like manner, the Reporter on the Products of India, with able coadjutors, brought forward into prominence a large amount of information on other vegetable products of that region, together with details of an analogous kind concerning products of the animal and vegetable kingdoms. The museum at Fife House afforded proof of the advance made in these directions; the specimens of raw produce being vastly more numerous than they had been in the former *locale*, and arranged more favourably for illustrating varieties of quality and application. An enterprise started more recently by Dr Forbes Watson, relating to manufactured rather than raw produce, but intended to aid in the development of the resources of India, we shall touch upon presently.

While the museum was at Fife House, a magnificent new India Office was being planned and erected at Whitehall, worthy of the vast range of business which has to be conducted by the department of the Secretary of State for India and his Council. Here, however, was a muddle—one of those muddles which have so often disfigured our proceedings in erecting public buildings. No provision whatever was made in the new structure for the reception of the rapidly growing museum, nor for the valuable library of oriental books and manuscripts possessed by the Department. Fife House being required for other purposes, the curator and his museum received an official notice to quit, and then a very bungling arrangement was made. A series of wooden rooms was built on the very roof-top of the architectural structure in Whitehall, or rather between Downing Street and St James's Park; and in those rooms the various collections were placed on removal from Fife House. The ascent up a narrow staircase to a great altitude was fatiguing; the visitors had to cross corridors which were intended only for the use of secretaries and clerks; and the wooden rooms with glass roofs or skylights were uncomfortably hot in summer weather. One counterbalance there was: the rooms were better lighted, and the objects better seen, than in either of the former localities.

Another change, another shifting of house and home. The India Museum, after being perched up among the roofs of the new India Office from 1869 to 1875, has lately been transferred to far-away South Kensington. When the unlucky annual International Exhibitions came to an untimely end last year, the commissioners did not know what to do with the empty galleries which they had erected, and the freehold of which is virtually in their hands. They eventually made an agreement whereby the India Department leases for three years such of the galleries as are situated eastward of the Horticultural Gardens; and in those galleries, on the recent first of June, the often-shifted East India Museum was opened to the public. The upper galleries, being lighted from the roof, are well enough suited to the

purpose in view ; but the lower range, lighted only by windows on the one side, are not so fortunate.

It is understood that the store-rooms belonging to the Department still contain treasures which have never yet been opened, for want of space to display them ; but the exhibits are more numerous than they have hitherto been, and are likely to increase gradually. The reader will infer, from the foregoing details, that the collection illustrates many different phases of India life—princely, commercial, agricultural, religious, domestic, personal. Of the arms and armour pertaining to some or other of the tribes or nationalities, we find specimens in the forms of muskets, matchlocks, pistols, scimitars, daggers, lances, spears, coats of mail, &c., some of them elaborately adorned with damascene work. The musical instruments of the East are shewn in considerable variety—from the simple tom-tom up to complicated varieties of the lute and guitar class. The garments of the Hindu and Mohammedan natives are shewn in various ways, by means of woven piece-goods, made-up garments, and photographs of real persons in their ordinary attire. Here we see the diverse modes in which silk, cotton, flax, and wool are woven up into piece-goods, and the application of such goods in making the garments known to the natives as *cols*, *topees*, *dhotees*, *cummerbunds*, and so on. The fibres, seeds, and other vegetable products, as well as the specimens derived from the animal and mineral kingdoms, we have already adverted to. Perhaps the most interesting of all are the implements and models which illustrate the daily life of the Hindu. We see his drinking-vessels, dough-troughs, rice and grain hand-mills, roasting-skewers, crocks for boiling, pans for parching grain ; we see his rudely constructed saws, planes, chisels, centre-bits, looms, ploughs, mills, bellows, windlasses ; we see models of his howdahs, palanquins, dak post chaises, carts, boats, and cutamarans. Groups of small figures, modelled by native artists, and properly attired, shew the handicraftsmen at their daily labours. Still more fully are these matters illustrated by means of drawings and photographs, of which the collection is large.

The migrations of this excellent museum are not yet come to an end. From the India House in Leadenhall Street it was driven to Fife House, thence to the new India Office, now to South Kensington ; where it is only a lodger for a term of years. The government have a project for erecting an entirely new structure, on a quadrangle of crown land adjacent to the India Office ; a building large and complete enough to display the museum in all its fulness ; together with a library to contain the valuable books and manuscripts belonging to the department ; and other auxiliaries to facilitate the arts, sciences, literature, and industry of the East.

Dr Forbes Watson advocates the formation of *Trade Museums*, based on the vast collections of specimens now belonging to the government of India. A commencement in this direction has been made by Dr Watson, curious and valuable in its character. The India Department authorised the collection, in India, of as many varieties of native woven goods as possible, made of all the usual kinds of fibre, and suitable for all varieties of male and female costume. These specimens were cut up into pieces of convenient size, and arranged in a

systematic way ; they were seven hundred in number, at once as diversified and as characteristic as possible, in order to furnish English manufacturers with trustworthy information concerning the goods most likely to find a market in the East. All were arranged in a series of interleaved folio volumes ; and each page contained a little printed information touching the sample or samples actually there shewn, noticing the district of India where it was made, the kind of fibre employed, the price at which it can be purchased on the spot, the length and breadth of the pieces in which that cloth is usually woven, and the kind of garment for which the Hindus and Mohammedans of India usually adopt it. Every sample being numbered, it can at any time be referred to by its distinctive number. The illustrative effect of the series is farther increased by the insertion of admirably coloured photographs of natives clothed with the particular kinds of garments under consideration. When one such set of these valuable volumes had been thus prepared, another was commenced, then another, and so on, until twenty complete sets altogether had been completed. The India Department has been no niggard in dealing with these sets ; it has neither kept them nor sold them. One set is deposited in the India Museum ; others have been presented to the chief centres of the silk, cotton, linen, and woollen manufactures in the several sections of the United Kingdom ; while the rest have been forwarded to Calcutta, Madras, Bombay, and one or two other great cities in India. In most cases the gift is made to the townsmen generally ; the municipal authorities are trustees in the matter ; and it is laid down as a rule that intelligent foremen and workmen, as well as merchants and manufacturers, shall have every access to these valuable illustrative samples. Dr Watson remarks : 'As it is intended that these volumes shall be followed by specimens of such Indian products as are either now or likely hereafter to become of commercial importance, it is anticipated that this effort on the part of the Indian government to extend a knowledge of the manufactures and products of the territories under its control, will be the means of establishing really practicable Trade Museums, in important districts now devoid of any such aid to their commercial progress.'

#### A SEA-SIDE ADVENTURE.

I WAS in rather a poor state of health, caused by long and assiduous attention to business, in the firm to which I belonged in Crutched Friars. My physician recommended rest and sea-air. I was to go to some quiet spot on the sea-side, live simply, avoid late hours, and all causes for harassment. It would be a great thing if I could night after night get a sound sleep, and be for a time free of any anxiety. Rest for the brain was to be the sovereign cure. Acting on this pleasant advice, I chose Lulworth in Dorsetshire, as quiet and dull a place as could possibly be discovered. To help the cure, I was medically recommended to avoid the glare of sunshine, to wear blue spectacles, and have my hair cut short ; all which, with other advices, I attended to.

Passing over any account of the journey—except

that a fisherman, of the name of Vye, who happened to be at Wool (the little station for Lulworth), drove me across in his gig to my destination, and proved to be a very agreeable companion—behold me at Lulworth, poking about for lodgings, and finding accommodation at an old-fashioned cottage, kept by one Mrs Cruxley. As for dullness, nothing could match the situation. The only living objects to arouse curiosity were a lady and her daughter, who, walking about, seemed to be borne down by some awful sorrow. I saw that the daughter was an extremely interesting girl, with a pair of eyes which, as they met mine, imparted even through my blue spectacles a peculiar sensation.

For days and days I spent the most monotonous and regular life, by degrees extending my walks along the cliffs, and making the acquaintance of the coast-guard, ensconced in his turf shelter just above the cove. Wherever I went, there were the two ladies, peering about, and exciting curiosity in their movements, wander where I would along the cliffs. They appeared to be for ever on the outlook for some object on the horizon. There was a mystery about them I could not fathom.

Well—three weeks passed, and one afternoon, after a heavy sea-fog which had lasted for six-and-thirty hours, I strolled far away across the downs, and struck the coast almost at the extreme western end of the range of tall chalk cliffs. It was the farthest point I had just reached, and it revealed the altered character of the country and shore, which here gradually flattened out, until it was nearly a dead level, stretching towards the distant town of Weymouth. The solitude of the spot, the balmy autumnal air, the smooth sea, and pleasant sandy beach, all suggested a bath. Clambering down the rocks, I was about to undress under the lee of the cliffs, when I was startled at hearing, as I imagined, a footstep in the loose shingle. Yet, no human creature was visible. I concluded that the sound was a mere fancy; and so assured, I was soon in the full enjoyment of a delightful bath in the placid ocean before me.

By swimming out to some rocks that rose above the sea, I abandoned myself to the pleasant novelty of the situation. Only by chance did I cast my eyes landward, and there, to my vexation, was a stranger on the beach. It must have been his footstep I had heard, and how he had concealed himself, I could not divine. Yet, there he was; and, to add to my consternation, he began to take off his own clothes, and to dress himself in mine. My first impulse was to call out, and next to swim hastily to the shore, and give chase. All my efforts were vain. Before I touched the shingly beach, the stranger, or thief I must call him, had donned my garments and vanished among the cliffs. I was naked and helpless. My only resource was to put on the clothes which the wretch had left as his own.

Here was an extraordinary source of perplexity. The thought of having to put on these clothes filled me with disgust. A more motley and coarse

attire I had never seen, only fit, as I imagined, for a mountebank of the lowest character. There was, however, no choice, unless I wished to walk to Lulworth in the costume of our first parents. It was some consolation that this incomprehensible dress was tolerably clean, and was not on the whole a bad fit. The odd thing was the diversity of colours and marks. There were conspicuously stamped the letters P. S., and below them the figures 5755. Ridiculous as was this strange attire, it was clear that I should hasten to the nearest coast-guard station and give notice of the robbery. As the afternoon was waning, there was no time to be lost.

On straggling, hatless, up the side of the cliff, I noticed two figures watching me curiously from above. They were boys, who, as I approached them, waved their caps, and, with a sudden shout, ran off at top of their speed. Gaining the crest of the high down, I again caught sight of the boys, still running. Presently, two men met them; they spoke together, the boys waved their hands excitedly in my direction, then all advanced towards me. I, in my turn, moved to them, and as I approached, I saw one was a coast-guardsmen, the other a policeman. As we neared each other, the boys fell back behind the men, and the men themselves half halted, seemingly hesitating and irresolute.

But I went on, and as soon as I was close enough to speak, said to the policeman: 'Ah! you're just the man I wanted.'

'Funny, isn't it? You're just the man we wanted,' was the reply; and in another second the coast-guardsmen had seized me by the arms, whilst his companion slipped a pair of handcuffs on my wrists before I was well aware that it was done.

In my confusion and surprise, the truth did not as yet dawn upon me. This strange treatment added only another mystery to the affair; but I well remember, that, in spite of my perplexity, I was diverted by the behaviour of the boys, as, with a yell of triumph, they scampered back in the direction whence they had come. What followed next, is less distinct in my recollection. I know only that I protested, remonstrated, and begged my captors to explain. It was all in vain—the sailor's lips seemed hermetically sealed; and all I could elicit from the policeman was a dry 'All right; push on, or we shan't get to Portland before it's locked for the night.'

I was evidently taken for an escaped convict, and, looking at my dress, there were grounds for the supposition. Of course, I protested against such a belief, told who I was, and mentioned how it was my clothes were stolen while bathing. All was in vain. I was only laughed at, and heard that a reward of five pounds was offered for my recovery.

'We've got you, and will keep you,' said the policeman. 'Here comes the chaise to pick us up.' So into the chaise I was put, in spite of all remonstrance.

Now, I am a man of patient disposition, and my temper is not easily ruffled; although, in my present position, there was much to annoy, although the personal indignity of my arrest, and the mystery that hung over my immediate future, might make even the most stolid philosopher uneasy, there were some crumbs of comfort to be got from the ludicrous absurdity of the whole affair. Happily, in this out-of-the-way spot there was no one to recognise me as the branded felon borne back in fetters to the prison from which I had escaped. If "the chief" in Crutched Friars were close at hand, or even the melancholy interesting young lady whose glances had pierced my green spectacles, I might have hung my head; but I knew that, after all, this was only a case of temporary inconvenience; I could not fail, sooner or later, to succeed in proving my identity, and that I must be then at once set free. Bar the personal discomfort, the loss of a good suit of clothes, &c. and the escape of some hardened wretch, thanks to my unconscious assistance, the present was a curious experience, which few were likely to compass. In this way I argued myself into laughing almost at this excellent practical joke, in which Self was the principal sufferer, and the end of which, for all I knew, might still be indefinitely delayed.

Away, in the twilight gloaming, over the downs for a mile or two, and along the white winding chalk roads to the more level and wooded country; then past farms, and between tall hedgerows and straggling villages, until we reached the outskirts of Weymouth; then through the lighted streets and parades of the fashionable watering-place, alive with gay company and merry music; threading our way across a bridge, amongst docks, and wharfs, and shipping, till at length we emerged upon the long flat causeway that tops the Chesil Bank, and joins Portland to the mainland. The night had fallen, but the glories of a full moon flooded everything with light. On each side of the ridge slept the quiet sea beneath the twinkling stars, and right in front loomed the massive promontory of Portland, couched like a lion against the moonlit sky.

Miles high it seemed, that hill, a terrible ascent, steep as the climb that faces many who have also travelled this road, if, when once again free, they seek to struggle from crime to honesty. My courage sank somewhat during that long gradient, and by the time we reached the gloomy portals of the prison it was at its lowest ebb. The place was lonely and silent as the tomb; a solitary lamp flickered above the heavy gates, touching with spots of lustre the tips of the steel nails that studded all their panels. One of my escort jumped out and touched a deep-toned bell; and the next minute a little window, some six inches square, was opened in the door, and through it I saw the gleam of two white eyeballs, belonging, doubtless, to the same head, from which came now a very gruff and threatening 'Well?'

'We've got him!'

Instantly the voice changed. It was clear the escape was the source of deep anxiety to all at Portland, and that this was joyful news.

'What! Raschkoff? For these and all other mercies, the Lord's name be praised.' As if I, in my character of Raschkoff, was a very excellent dinner about to be digested by the establishment.

With a solemn clanging sound, the heavy doors swung back upon their hinges, and I was inside. Almost like clock-work, they closed again behind me, and although I knew my incarceration was certain to be short, I felt quite as if hope were altogether extinguished from my breast. At that moment, I would gladly have purchased immediate release at any price, and I asked indignantly to see the governor at once.

'He says he's Mr John Wray of Crutched Friars,' said the policeman, with a grin.

'Always was th' artfullest villain out,' replied the gatekeeper, pointing to me menacingly with his heavy key. 'It's not the first time he's done it, neither; calls himself a gentleman, because he was convicted for some gentcel crime, forgery, or like that. He was away six months last time, but we nabbed him then, just as you have now. But he made his "guy" again this morning in the fog, and got away as smooth as butter. It's here to-day with him, and gone to-morrow.'

'Ay, and back again at night,' said the sailor profoundly.

'I insist on seeing the governor at once,' I said, interrupting the dialogue.

'That you will, and sooner than you care to, either. He'll be in his office about nine to-morrow morning, and he'll have something to say to you, I suspect, private and particular.'

'There's no call for us to wait,' said the policeman; 'we can look up this way in the morning for the reward.'

'Off you go, then; but you'd better stay in the village to-night; the major might want to speak to you to-morrow. Good-night!'

'Good-night!'

The gates were opened again, my late companions issued forth, and in another minute I heard the sound of their wheels retreating down the hill. Immediately afterwards, I was ordered to move on to the inner gate.

There was a second gate under the archway, a dozen feet from the outer doors. This was of open iron-work, and through the bars I could see the tall outlines of the prison buildings. Just as we got to this inner gate, a man approached from the inside.

'Did you ring, Mr Tootle?' he asked. He was a tall man in uniform, wearing a long-waisted, well-fitting greatcoat; at his side was a sword, on his belt a bull's-eye lantern, and in the left hand a bunch of keys. 'Did you ring?' he repeated.

'I did, sir. It's that Raschkoff; the police have brought him back.'

'That's the best piece of news I've heard since

noon. Hand him over. Have you sent word to the governor?

'I've rung his bell. He or the deputy will be here directly. It's close on locking-up time.'

With these second gates, as they closed behind me, there seemed to fall another barrier between me and freedom, nor did my new escort encourage me to hope for much consideration.

Through more gates and doors, all of which were first unlocked, then locked, then re-locked, and locked again, till it seemed as if I was now as safe as the crown jewels, or a toad entombed alive in a granite rock. At length, we reached a block of buildings a little apart, with double doors, through which we passed, as we had the others, and I found myself on the ground-floor of an unmistakable prison. There were three rows of cells, tier above tier, the upper with a narrow landing and a bright steel railing. As we entered, another warder met us; he was in slippers, and walked noiselessly like a ghost. In a sepulchral voice, he said: 'Forty-six, sir, and all correct.'

'This will make forty-seven, Mr Mounsey,' said my conductor: 'it's that Raschkoff.'

'Shall I put him in the dark, sir?' was the eager query.

'No; in an ordinary cell; but keep an eye on the trap, and watch him carefully, or he'll break prison again; he's clever enough.'

I was introduced forthwith into an 'ordinary cell'—four bare walls, with a loophole window well barred, and wired over. There was nothing in the place but a gutta-percha pint pot, and a bed of smooth bare plank a little raised from the floor.

'Keep silence, will you!' said, for the thousandth time, the superior warder, as, for the thousandth time, I tried to protest that I was not Raschkoff.

'Mind, Mr Mounsey, you don't let him talk to you in the night; he'll be trying it on again, you may depend. Give him his bed, and fill his pint—there;' and they left me.

Alone, at last, and in a solitary cell in Portland Prison! The dreadful truth was difficult to realise; but bars and bolts, and iron doors, are solid facts not easily explained away. I felt as miserable now as if I was doomed to be hanged next morning. As I have said, from the first moment of my capture I had treated my mishap as an unpleasant joke—no more; and all along I had buoyed myself up with the knowledge that at the prison itself the mistake would be at once discovered. Of course I had said to myself, the officials there will know I am not the real Raschkoff the runaway. But it seemed as if no one knew anything of the sort. I had already passed through the hands of three, and though all had scanned my features closely, no syllable of doubt of my identity had followed their inspection. What if I should be kept to serve out the real convict's time, seeking vainly from day to day, and year to year, to make my protest plain? This would be too severe a dose indeed. Yes, I was most miserable. Cold, wretched, and nearly starved, for no food had crossed my lips since noon, I gathered myself together, and, sinking utterly dejected upon the hard pallet, tried to groan myself to sleep.

I must have slept; but the slumber at first was fitful, and often disturbed by the click of a latch at my cell door, and a flash of bright light through

a narrow slit turned on to where I lay. It was the warder on the alert to prevent another escape. Even the strangeness of this wore off, and I became thoroughly unconscious, to be roused at last by a deafening peal of bells rung just above my head. The dawn was struggling, in pale, sickly tones, through the wire-work of the tiny window, and I guessed that this was the prison-bell, the signal to begin the labours of the day. I was hardly at all refreshed by my sleep, and terribly faint from want of food.

'Can I see a doctor?' I asked, as two new warders came into my cell, and told me peremptorily to stand up and strip.

'Of course you can. But first of all we must search you; it ought to have been done last night, only you took us all by surprise—as you did too, when you hooked it. How did you get away, Raschkoff?'

'I tell you I'm not Raschkoff!'

Both the officers laughed heartily. 'You'll be the death of us, Raschkoff! But there—wash yourself; it's close on breakfast-time, and, after that, you shall see the young doctor.'

They brought me a pannikin of scalding hot cocoa, and a small loaf, which I devoured eagerly. They were capital; there was milk in the cocoa, and the bread was fresh and white. I got new courage from the food. Surely, said I to myself, there must be some one here who will confess that I am right; some one who can swear to the real Raschkoff. And then it occurred to me that I would let matters take their course, and desist from speaking another word in my own defence. I wondered only how long the farce would continue. I had plenty of visitors in the next hour or two. First, the 'young' doctor, as he had been styled, though he was old enough to have gray hair and a corporation. He was an airy, off-hand gentleman, wearing a stethoscope, like a flower, in his button-hole.

'There's nothing wrong with you,' he said angrily. 'Why did you send for me?'

'I feel faint.'

'Faint!' The utter contempt of these words made my blood boil. 'Were you faint yesterday morning, when you ran four miles, and jumped the dyke in the fog?'

I sank back almost in despair. Happily nine o'clock was now approaching, and preparations began for my trial in the governor's office. I was again stripped and searched; my boots were taken from me, and I got a pair of list slippers. Then, all at once echoing along the passages came a cry for 'Raschkoff'; and Raschkoff—that is to say, I, John Wray of Crutched Friars—shambled up two flights of narrow stairs, and entered a little dock on the further side of which stood a warder with a baton; while in front, some way off, was seated a portly, imposing personage at a high desk, and surrounding him, a group of officials, among whom were my friends the coast-guard sailor and the policeman.

'5755 Raschkoff! charged with making his escape, resisting the police, insolence to the gate-keeper, and giving the assistant-surgeon unnecessary trouble.'

All this the aforesaid portly gentleman read aloud, and then, without waiting to hear me plead, called upon my captors to give their story.

This has already been told. It was a little

embellished, no doubt, to glorify their courage. Next came Dunkley, the father of seven children, whom I, in my character of Raschkoff, was about to rob of their bread. Dunkley was about to plunge into details of the daring manner in which I had eluded his observation, when all at once his face fell.

'Here at last,' I said, 'is some one who knows I am not Raschkoff.'

'Go on, Mr Dunkley, go on,' said the governor. But Dunkley could not go on; already, with self-interest quickening his intellect, it had dawned upon him that they had caught the wrong man, that Raschkoff was still at large, and that, therefore, the seven miniature Dunkleys were far from secure from want.

I saw my opportunity.

'I wish to observe'—

'Silence!'

'I wish to observe,' again.

'Silence!' again, and more peremptorily.

'I will speak!' I said, growing resolute. 'I wish to observe that my name is John Wray of Crutched Friars.'

At which announcement the little court was immediately convulsed with laughter. Evidently, the joke of my alleged mistaken identity was considered highly amusing.

'I repeat, my name is Wray, and not Raschkoff.'

The governor for the moment looked as if he would eat me, and his myrmidons were little less aghast at my persistent insolence.

But Dunkley at last found his tongue. 'He's right, sir! He's not Raschkoff at all!'

'Not Raschkoff!' from the governor, who felt himself still one short of his total number.

'Not Raschkoff!' from the policeman, who felt himself a fool, and five pounds poorer.

'Not Raschkoff!' from the pious gatekeeper, from the first warder to the second, to the third, and so on along the scale, as all in turn expressed their surprise. But there was no doubt about it: Dunkley was positive; and other officers corroborated his statement. There were plenty now who knew the real Raschkoff by sight; warders with whom he had been in daily contact, and who saw at once that I was quite a different man. It was my misfortune that, on the previous evening, none of these had been on duty; but in a prison containing nearly two thousand felons, the mistake was more than possible.

At last the governor spoke, and angrily: 'Oh! but this is too absurd. What were you about, all of you? It's disgraceful!—And you, sir!—this to me—how dare you come here to insult us, and make us look like fools?'

One might have thought that I had been guilty of breaking into the prison by force, and that I had insisted they should keep me there for the rest of my life.

'But let me tell you, sir!' he went on, 'that there is such a thing as connivance, and that it is felony to assist a convict to escape; and that, before you are many hours older, you will be by the heels in Dorchester Jail for trial at the next assizes.'

'And let me tell you, sir!' I replied hotly in my turn, 'that there is such a thing as action for false imprisonment; and that if you do not instantly set me free, if there is any law in the land, before

you are many months older, you will be cast in heavy damages in the Court of Queen's Bench.'

'Nonsense, sir! I insist on hearing your explanation.'

My explanation! as if I hadn't wanted to give it these twelve hours past!

Then, in a few hurried words, I told him the whole story.

'But can this be corroborated? Have you any one within reach to speak to your identity?'

'There is the innkeeper at Lulworth, and others there. Or, stay; telegraph to my firm, Stokes, Wray, & Co. of Crutched Friars.'

'Will one of the partners come down?'

'Yes, no doubt, if it's urgent.'

'It is urgent. I am sorry to appear discourteous, or to disbelieve your story; all I ask is, that you will remain here'—

'In prison?'

'By no means; in my house, as my guest,' said the governor, with the bow of a finished courtier. 'All I ask is, to be quite convinced. I trust you will understand that I am bound, in my serious and responsible situation, to take nothing for granted.'

'And my clothes?'

'I daresay we can fit you out,' said the governor, with a slight smile. 'We keep a large stock of ready-made clothes—no, not convicts', but free men's, for prisoners on discharge. Step into my private room, and you shall make the change at once.'

In half an hour I was at breakfast, and at the right side of the gates, with my host.

'Our Mr Stokes' arrived that evening by five, with full proof of my identity; the governor was satisfied; and I left Portland gladly enough within half an hour afterwards. Mr Stokes went back to town at once, but I got out at Wool, intending to walk to the inn. Strangely enough, there was Vye, who had taken me and my luggage in his cart from the station at my first arrival three weeks before. I hailed him. He evidently did not recognise me in the least.

'No wonder you don't know me,' I said. 'A nice time I've been having of it these last four-and-twenty hours.'

My voice alone seemed to bring back a gleam of intelligence into his face. Slowly his eyes opened wide, and his lower jaw dropped.

'Surely,' he said, 'I saw you a-goin' away last night quite late with the two ladies. They sends down to the Cove, and orders a fly just afore ten—says they are obliged to go unexpect, and must catch the mail-train; and as I was a-comin' over top o' Church Hill, I see you a-standing at corner o' cross roads. Then I remember the moon was a-shining pretty nigh as bright as the sun at day. I was coming down to-wards you, when up comes the ladies' fly, and in you gets long afore I could near you. I tells my missus, and she says: "'Pond upon it, the gentleman's eloped;" and when I heard at the Cove this morning as you 'adn't been home all night, I thought she was about right; mayhap'—

Here Vye stopped abruptly, looked round as he saw the station-master coming out of the office, and called to him: 'Here, Muster Coombs, didn't the two ladies go away last night with the gentleman in blue barnacles and brown billy-cock, same as I drove over to the Cove three weeks ago?'

'Yes; surely,' answered Mr Coombs, but with a little hesitation as he looked at me. 'I certainly thought it was the same gentleman, from his dress and short hair; but we were rather busy, and I didn't take very close notice. Wasn't it he, after all? Now I look at you again, sir, how is it? You have just come from Weymouth. I don't rightly remember you, either. Anyhow, I gave the two ladies and the gentleman I took to be you, three first to Southampton, by the 10.45 last night; more, I can't say.'

Here was a complication! What association could there have been between the convict and those two ladies? And was it really he, disguised in my dress, that Vye and Mr Coombs had seen?

As I pondered for a moment, the station-master had gone back to his office, and come out again with a large brown paper parcel in his hand. 'By the way, Vye,' he said, 'you may as well take this to Richards at the Cove. I'd almost forgotten it: came down mid-day; there's nothing to pay;' and he handed it to the fisherman.

Of course, it was not unusual to make Vye a carrier; and very soon he and I were once again jolting towards Lulworth.

The parcel lay in the bottom of the cart at my feet, and I remember observing quite casually that it was directed merely to the 'Proprietor of the Cove Hotel, Lulworth,' and that the handwriting was that of a lady, and had rather a foreign character about it. Intense consternation and wonder prevailed on my arrival at the inn. Everywhere it had been clearly settled that I had eloped; and though none of the gossips I spoke to had seen the man in the blue spectacles and brown billy-cock go off with the ladies, except Mr Vye, his account of that event, and my absence, were the two and two which, put together, left no doubt in the minds of the astute natives.

Indeed, I could not find that anybody, coast-guard, or the owner of the lady's lodgings, had seen the fellow; and but for the station-master's confirmation of Vye's story, I should not have believed it.

My room and belongings had been left undisturbed, and it was with no small relief that I once more found myself wearing clothes of my own. Whilst I was setting myself a little to rights, and puzzling over the connection which there seemed to be between the two ladies and the man to whom I owed so much misery, the landlord appeared, with the parcel we had brought from the station in his hand.

'This 'ere's for you, sir, I 'spect, 'cording to the direction inside it.'

He had undone the outer cover, and within was a second parcel, directed as follows: 'For the Gentleman who wears Blue Spectacles staying at the Cove Hotel.' I cut the string, and found—what? My clothes and wide-awake, and the contents of the pockets intact!

As I examined them, a sheet of note-paper fell to the floor: on it were written, in the same hand as that on the two directions, these words: 'Beyond restoring the inclosed articles, it is improbable that any reparation can ever be made to the gentleman to whom they belong for the outrage to which he has been subjected. If his looks have not belied him, however, it is just possible that he may find some consolation, and an apology, in learning that his clothes have been the accidental

means of restoring to a mother's and sister's arms an erring and repentant man. If the law has been outraged, the gentleman has been at least an unintentional accessory, and whether this fact allays his scruples or not, it is believed that, by the time these words are in his hands, the culprit will be beyond the reach of any efforts he may be the means of helping the authorities to make towards a recapture.'

As far off as ever, almost, from the details which led to this strange affair, broadly speaking, the letter, nevertheless, gave me an inkling of the truth. Whether it was a preconcerted plan between the unhappy ladies and their unhappy relative, this meeting on the Dorsetshire coast; whether he had managed to escape for the second time, knowing where they were; whether they, in their misery, were led to that out-of-the-way retreat by a helpless longing to be near him, and had so far ever been sitting watching his rocky prison, and that he as accidentally lighted on them as he had on the opportunity my clothes gave him for getting out of the way, I shall never know. It was quite enough for me to remember that young girl's face, to stay any promptings I might have had to aid the law. Her appealing look had more than once made me long to help her, and I had done so, if through no merit, at least through no fault of my own, and I was not a detective.

More than ten years have passed since all this happened. I have been long married, and it chanced that I spent last autumn at Weymouth with my family.

One day I paid a visit to Portland prison—a second visit. How different from the first! Governors had been changed. The system of discipline, as is observable from late reports, so immensely improved as to render an event such as I have described next to impossible. The chief warder, though he did not remember me, remembered the escape of '5755 Raschkoff.' 'Yes, sir;' and '5755 Raschkoff is still at large!'

## PRINCE RUPERT'S DROPS:

### A REVOLUTION IN GLASS-MAKING.

AMONG the many inventions popularly attributed to the cavalier Prince Rupert, the result of the ten years of study and research which closed his life, perhaps the best known is that of the drops of hardened glass which bear his name. A Prince Rupert's Drop is made by throwing a little molten glass into water. It is thus suddenly cooled, and the outer portion being hardened while the interior is still expanded by heat, a curious state of tension is the result. The drop is generally round and thick at one end, and drawn out into a long slight tail of glass at the other. One may strike the thick part with a hammer without breaking it; but let the smallest portion be broken off the tail, and the whole drop falls into a heap of minute fragments and dust. It is a favourite toy with children, and doubtless many of our readers will remember how, in their school-boy days, after they had fully tested the remarkable fact, that do what one would there was no use trying to knock the thick bulbous heads to pieces, one vigorous pull would snap off the end of the thin tail of glass, and

with a 'bang,' the long-resisting drop would fall into countless fragments and grains of dust. And a moment's examination of the shattered remains of a Prince Rupert's Drop is sufficient to shew that it is very different from the *débris* of ordinary broken glass, of which even the smallest grains have sharp little points and edges, so that it pierces and cuts the hand that touches it incautiously, while the fragments of the 'drop' carelessly broken between one's hands are quite harmless. And yet it is only a little melted glass suddenly cooled by being dropped into water.

This is all very wonderful. It has puzzled wiser heads than those of school-boys. But since it was first invented up to the present year it was of no real use to any one. It was a curiosity, and nothing more. But a few months ago one of these drops attracted the attention of a French chemist, M. Alfred de la Bastie of La Bresse, in the department of the Ain, near Lyon. He noticed that it was only the very thin end of the drop that was liable to fracture, that even then considerable force had to be employed, and that it was almost impossible to break any other part of the tail of the drop, though its thickness was nowhere greater than a small fraction of an inch, and much less than that of an ordinary pane of glass. He then began to consider whether it might not be practicable to impart the same hardness to common glass, without destroying its transparency. Fortunately, he possessed ample means for research; and after a long course of experiments in his laboratory at La Bresse, he has lately succeeded in producing, by a simple process, specimens of glass perfectly clear and transparent, but as hard and as durable as steel. He gives it the name of *verre trempé*, or tempered glass. It has been noticed in some of the English papers under the name of 'toughened glass,' an epithet which is hardly applicable to it, and certainly gives an incorrect idea of its nature—hardened glass would be a better word.

The idea of giving this hardness to glass is not a new one. Réaumur succeeded in hardening it by a process of crystallisation, but in doing so, he made it perfectly opaque, and therefore useless for practical purposes. M. de la Bastie has obtained a really valuable result by a different process, first suggested, as we have said, by the hardening or tempering of melted glass in water in the formation of Prince Rupert's Drops. His object was to find some method of tempering ordinary glass to an equal hardness. It was necessary to discover the proper composition of the bath in which the newly made glass was to be plunged, and the exact temperature for the process, for if it were too hot it would change its shape, and if it were not hot enough it would break in pieces on being plunged into the liquid. Finally, it was necessary to devise the mechanical means for economically working the invention. The results have been exhibited by M. de la Bastie to visitors to his laboratory at La Bresse; by M. de Luynes, one of the professors of Paris, to a great scientific réunion at the Sor-

bonne; and in London by the agents for the invention, and the *verre trempé* has stood the severest tests. As yet, the details of the process are kept secret, but an outline of its main features has been published by M. de la Bastie. The liquid in which the glass is tempered is a compound of melted wax and resin and various oils, and these ingredients are mixed in different proportions, according to the purpose for which the glass is intended. The liquid is raised to a high temperature in a large vat, and in order to prevent its taking fire with the heat, the air is carefully excluded from it. At a little distance is an oven, in which the glass is raised to a red-heat, so that it is very near its melting-point. From the oven, a metallic slide (which, by means of a pivot, can be inclined to any required angle) communicates with a table fixed in the vat, and having the same inclination as the slide. As soon as the glass has reached the required temperature in the oven, it is pushed out upon the slide, and descends by it to the inclined table in the vat; the depth to which it is allowed to sink in the oil being regulated by a kind of brake, which stops it at the proper point. It is allowed to remain there for about a minute, and then a self-acting rake draws it into a metal frame, and this is removed from the vat, and the glass is allowed to cool. Some more glass, meanwhile, has taken its place in the vat, and so the manufacture of the *verre trempé* goes on without ceasing. Thus, the process is a very simple, cheap, and rapid one, and it is calculated that in this way one furnace and vat, served by three workmen, could in the twenty-four hours temper eighteen thousand watch-glasses at a cost of fifteen francs, or about twelve shillings and sixpence.

M. de la Bastie has succeeded in tempering glass whose thickness is measured by a few millimètres as well as heavy plate-glass. It is as transparent as ordinary glass, but so hard that it can be thrown on the ground without injury. The diamond will not cut it, but it can be cut or pierced with the sand-blast, and engraved with powerful acids. It has, however, a different refractive power from ordinary glass, and the Academy of Sciences of Turin has just begun a series of experiments on its optical properties in the refraction and polarisation of light, with a view to its employment in making scientific instruments.

The tempered glass is estimated to be about fifty times as strong as ordinary glass, and it is, moreover, very elastic, a circumstance to which it perhaps owes much of its strength. A curved sheet of tempered glass was placed on the ground by Professor de Luynes, with its concave side downwards, a man then stood on its convex surface, and it bent under his weight without breaking, resuming its original form as soon as he stepped off it. Watch-glasses were submitted to the same test, a man placing his heel upon one of them, and then throwing his weight upon it without being able to break it. Panes of glass,

plates, candlesticks, watch-glasses, were thrown into the air and fell to the ground without breaking, the lighter pieces of glass rebounding from the floor. 'You see,' said M. de Luynes, 'when you ask for verre trempé in a shop you can always make sure that the dealer is offering you the real thing, for you can test it by throwing it on the floor.' A plate of tempered glass placed over a spirit-lamp close to the flame bore an intense heat without breaking. A glass cup of cold water was placed on a fire, and left there until the water boiled, without any injury to the glass; and similar experiments have been performed with oil, sulphuric acid, and other liquids which have even a higher boiling-point than water. M. de la Bastie believes that his glass can therefore be used in making cooking utensils. It certainly will be very valuable for retorts and other glass instruments in the chemist's laboratory. These are at present constantly liable to fracture, and often with very unfortunate results.

In a course of careful experiments, the resistance of the verre trempé was compared with that of ordinary glass. The plates of glass were of equal size and thickness, and a piece of copper weighing about two-and-a-half ounces was successively dropped upon them from gradually increasing heights. In no case did the ordinary glass resist the fall of the copper from a greater height than three feet, while the verre trempé was unbroken even when the fall of the copper was twelve feet. On examining it, metallic marks were noticed on its surface, and the copper was found to be dented by the violence of the blow! A visitor to M. de la Bastie's workshop, after witnessing this experiment, said jestingly: 'Well, sir, all you have to do now is to roof our houses with glass.' The joke suggested a new test to the inventor. He sent for a roofing-tile. It was broken by the fall of a five-ounce weight from a height of six feet; while the same weight was dropped from a height of over ten feet on a plate of verre trempé one-third of an inch in thickness without doing it the least harm. When this glass is broken by an over-severe strain it resolves itself into a heap of small fragments like those of a Prince Rupert's Drop, and one can plunge with impunity the bare hand into a heap of this vitreous dust. This is a great advantage, as the fall of broken skylights and glass roofs would be quite harmless to those who chanced to be beneath, if they were made of verre trempé. But such an accident would then be almost impossible.

M. de la Bastie is building a great manufactory, and establishing agencies for the working of his invention, and there is no doubt that it has a great future before it. The glass roofs of railway stations and workshops, huge buildings of glass like the Crystal Palace, conservatories, the beautiful windows of Gothic churches, are all at present liable to damage from storms of hail and wind. Once the verre trempé comes into use, all these great surfaces of glass will be as durable as walls

and roofs of steel, and the saving of repairs and the sense of security thus obtained will more than compensate the slight additional cost. We have already referred to its use in the laboratory and the kitchen, but it would take a volume to reckon up all the purposes for which it can be employed. A revolution in glass-making has begun in M. de la Bastie's quiet laboratory at La Bresse. He has achieved what seemed impossible, and changed the meanings of words. Who will talk now of things being 'as brittle as glass?' and as for the venerable proverb, that 'those who live in glass houses shouldn't throw stones,' the owner of a well-made glass house might now laugh at all the stone-throwers in Christendom, as he heard their harmless missiles rattling on his transparent walls of verre trempé.

#### THE FAIRY SHELL.

ONE day, when wandering on the shore  
That once was ruled by Marinell,  
I found within a clefted rock

A strangely twisted, curious shell  
With spiral whorls of pearly white,  
And hollows tinged with roscato light.

This shell possessed a wondrous power,  
For, placed against the listener's ear,  
He heard, though gentle, faint, and low,  
The tones of those he held most dear;  
Though parted far by land or wave,  
The faithful shell an echo gave.

'Oh, happy gift to man,' said I;  
'More precious than the painter's art;  
How oft shalt thou, in distant climes,  
Console the ever-faithful heart,  
Bring back the cherished voice again,  
And take from absence half its pain.'

'Vain are thy thoughts,' a nymph replied;  
'For those who own it will lament  
That never, through its echoes faint,  
Can tidings from the loved be sent:  
The distant sound is only caught,  
But never word or message brought.

'Twill only waken yearnings vain;  
'Twill only pierce the heart anew,  
And bring to mind with tenfold pain  
The anguish of the last adieu.  
When all is lost beyond recall,  
'Tis better far a veil should fall.'

She ceased. I turned, and threw the shell  
Beneath the tossing, foaming tide;  
Too well can memory waken grief,  
That man should seek for aught beside.  
Love needs it not; for Love can last  
When all the things of Time are past.

## THE NEW FOREST.

IN the course of an excursion lately in the south of England, I thought of visiting the New Forest in Hampshire. One of my pleasant memories of that sylvan piece of country carried me back five-and-thirty years, during which period changes of various kinds were said to have taken place, and, to judge from newspaper discussions, still greater changes were in contemplation. So, to see the Forest once more, I bent my way by steamer from Cowes in the Isle of Wight to Southampton, and thence, instead of railway transit, preferred to roll forward in a westerly direction in an open carriage, to Lyndhurst, the capital of the Forest, if capital it can be said to have. The distance was ten miles, and as the day was fine, there was a prospect of enjoying the fresh air and sunshine.

Getting free of the old fortified walls of Southampton, and of lines of modern villas, we pursue a rather commonplace route, until, the country becoming more open and natural in appearance, we glide without any perceptible boundary into the realms of the Forest. Historically, the district is interesting. As is well known, it was appropriated by William the Conqueror, and set apart by him as a royal hunting-ground, under the peculiar restrictions of the Norman forest laws; it being chosen for this purpose from its neighbourhood to the royal residence at Winchester. What were the original dimensions of the tract of country so selected, we are nowhere satisfactorily told, but are led to suppose that the Forest was at least sixty miles in circumference. To render it suitable for the chase, it is alleged that the country was laid waste, its villages, churches, and hamlets rooted out, and the inhabitants driven away; and further, that William either planted the district with trees, or added to the woods already growing on the spot. There may be a general truth in the statements regarding the process of desolation, but doubts arise as to the wholesale planting or to the extension of the woods. The original meaning of the term *forest*, was a *frith* or wild piece of country, set

aside for field-sports. In the old chronicles this particular forest is designated 'a mickle deer-frith.' There were in it, no doubt, tracts covered with trees of an ancient date, but as we shall immediately point out from personal observation, there were likewise comprehended huge stretches of ground on which nothing would grow but gorse or heather, and which for any useful purpose were almost as valueless as the sands of the desert. We are, therefore, to understand that at no time was the land in the New Forest wholly covered with growing timber; that it was only woody here and there, with bare and barren intervals, miles in breadth, which yielded no shelter to the beasts of the chase. A similar condition of things is known to have pertained to nearly all the old royal forests in England and Scotland. They were simply wild pieces of country, with patches of trees and bushes, amidst which the game found a harbourage; while the open spaces, like the inclosed fields of modern days, offered no obstacle to the onward sweep of mounted huntsmen.

Whatever was the original extent of the 'mickle deer-frith,' it was destined to suffer encroachment and diminution, but without, till the present time, suffering a material change of character. Assuming its primary size as being sixty-six thousand three hundred acres, as many as twenty-five thousand acres have been granted or sold as manors or freehold estates, nine hundred acres are the encroachments of squatters, a thousand acres are held on leases from the crown, and upwards of eleven thousand acres are inclosures round the keepers' lodges. Such is a common computation, which we do not attempt to verify. All we can say is, that the New Forest, as now seen on travelling through it, is a jumble of three or four varieties of land—inclosed estates with gentlemen's mansions, differing in no respect from ordinary private properties, as regards division of fields, farm-steadings, gate lodges, and ornamental parks; petty inclosures connected with detached cottages and hamlets; ground protected by fences for rearing plantations of young firs; tracts with old timber; and open heaths. These last two kinds of property are for

the most part unfenced, and to all appearance are free to the rambles of pedestrians, and professional visits of artists. The public roads penetrating the Forest in different directions are a remarkable feature. Made of a reddish flinty material dug from gravel-pits, they are smooth and excellently kept, are free from the nuisance of toll-bars, and pursue long lines as straight as an arrow. Driving along these admirable highways, you feel as if journeying through well-kept pleasure-grounds; and as the land is generally undulating, with occasionally knolls or low hills covered with wood, the scenery is far from being devoid of the picturesque.

By one of these straight roads we reach Lyndhurst, a village consisting of a row of brick houses, two stories high, on each side of the road, with the parish church occupying the summit of a knoll on the west, and the pointed spire of which is seen for miles distant. The inhabitants are perhaps a thousand in number, most of them following the trades required by the neighbourhood. We can hardly imagine a place more primitive. Its few shops are of a compound character. The baker deals in stationery, the grocer sells carpets, and the chemist has a fair show of drapery and photographs. There is no bookseller or news-vendor, and no bank for general accommodation in money matters. The town, to call it so, has no gas-lamps, not even oil-lamps for lighting the thoroughfare. Water is not led on to the houses, and there is no system of sewage. Yet we see nothing offensive. On the contrary, all is rural, simple, and attractive. The windows of the humblest dwellings are draped with white curtains, and in the whole of them we are gratified with the sight of rows of flowering plants growing in pots, which is at least a good sign of popular tastes and habits. Little seems to be doing. The only conspicuous object in the usually dull street is a public pump. Obviously, the place is under some deadening official influence, which restricts its improvement and keeps it poor; and of this I heard some complaints. In the vicinity, there are some dwellings of a superior order. To strangers, the great defect of Lyndhurst is the want of proper accommodation. Only with difficulty did I find a roof under which to put my head, in a very small inn of the old-fashioned sort. This deficiency is to be regretted, for the climate is delightful, and Lyndhurst forms an excellent starting-point for excursions to the different scenes of interest in the Forest, and I have no doubt that, were convenient lodgings to be obtained, the place would become a favourite resort for summer visitors.

It would be worth any one's while to visit Lyndhurst, if it were only to see an exceedingly beautiful work of art in the parish church. This building, which was erected only a few years ago to supersede a mean decayed edifice on the spot, is constructed of brick of divers colours, in a handsome Gothic style, and cost, as I was told, about fourteen thousand pounds, which sum was

raised by public subscription. The object of interest just referred to consists of a fresco-painting on the east end of the chancel, stretching from side to side over the communion-table, somewhat in the character of a reredos. It is the work of F. Leighton, R.A., and was munificently presented by him to the church. The subject is illustrative of the parable of the ten virgins. The central figure, Christ, meek and radiant in a white robe, has on the right the five watchful virgins in different attitudes, with their lamps blazing; while on the left are the five negligent virgins, abashed and sorrowful, with their lamps extinct. Certain figures of angels are introduced to bring out the full sentiment of the design. To aid the perspective, the scene represented is in a species of portico, with slender pillars in the foreground. Advancing up the nave of the church, we are startled with the life-like and truthful character of this marvellous wall-painting. Its soft richness of colouring, its beauty, its fine drawing and grouping, rivet attention, and after enjoying the sight of it, one draws himself away with a feeling of regret. I confess to having gone to the church on Sunday very much with the view of having another look at Mr Leighton's exquisite production; but otherwise had reason to be satisfied, for the service was well conducted and edifying. The fresco has been successfully photographed by Mr J. G. Short, Lyndhurst. I brought away a copy.

Settled down in a quiet retreat, I was soon fortunate in discovering that Mr Judd, the intelligent postmaster, kept for hire a horse and waggonette, which, with himself as driver, were at my disposal. The very thing I wanted. The means of driving about the Forest, with one who was able to afford some local information, came quite readily to hand. For several days, therefore, I am to be considered as sallying forth in quest of scenes interesting to the tourist; sometimes driving along those wonderfully straight highways, sometimes quitting the main routes and getting into cross-roads which wound among the lofty trees, where, for mile after mile, not a human being or any living creature was visible—nothing but the grandeur of nature and a tremendous solitude. For such excursions in the Forest, a guide is indispensable, and so far I was happily situated. Owing to the absence of houses, and the entangled divergence of cross-ways, any stranger might very easily lose himself, and wander for hours in a maze of perplexities.

My first excursion was towards Minstead, to a distance of two or three miles in a north-westerly direction, for the purpose of seeing Stony Cross, such being the name given to a memorial, known as Rufus's Stone, which in point of fact is not a stone, but a quadrangular pillar of cast-iron, about four feet high, indicating the spot where William Rufus was accidentally killed. In the silly craze for chopping off morsels, the original stone had been utterly destroyed, and hence the use of a less

perishable material. It stands in an open glade of green turf, at the bottom of a hill, near the roadside. We read as follows, on the first side: 'Here stood the oak tree, on which an arrow, shot by Sir Walter Tyrell at a stag, glanced, and struck King William II. (surnamed Rufus) in the breast, of which he instantly died on the 2d day of August, anno 1100.' On the second side: 'King William II. being slain, as is before related, was laid in a cart belonging to one Purkess, and drawn from hence to Winchester, and buried in the cathedral church of that city.' On the third side: 'That where an event so memorable had happened might not be hereafter unknown, this stone was set up by Lord Delaware, who had seen the tree growing in this place, anno 1745. This stone was repaired by John Richard, Earl Delaware, anno 1789.' On the fourth side: 'This stone having been much mutilated, and the inscriptions on each of its three sides defaced, this more durable memorial, with the original inscriptions, was erected in the year 1841, by William Sturges Bourne, warden.' The memorial, secured from dilapidation by being constructed of iron, is painted a grayish colour, to resemble stone, and seems likely to defy the hammers of those unscrupulous tourists who take a fancy for destroying all objects of curiosity within their reach. In Lyndhurst there is an old red brick edifice, near the church, shrouded in ivy, called the King's House, in which is the Hall, where the affairs of the Forest were at one time administered, and in which the pretended stirrup-iron of William Rufus used to be, and is perhaps still, shewn to the credulous.

The most satisfactory of my excursions through the Forest was to Boldrewood, lying several miles to the south of Lyndhurst. This, in my opinion, is the only spot worth visiting, so far as the spectacle of grand old timber is concerned. The trees are mostly oaks and beeches, of great height, and picturesque from their rugged antique appearance. Here and there we traverse open glades of greensward, on which grow a profusion of gorse and ferns, and where are observed browsing the black pigs and the cows of the villagers, also the gray Forest ponies which roam about in a state of nature. The deer are no longer seen. They were extirpated in 1838, as being a provocative of poaching, and no end of demoralisation. At present, the whole of the domain is under rigorous police regulations, at the instance of the Commissioners of Woods and Forests. No unprivileged pursuit of game is permitted; no scraps of wood or bushes are allowed to be taken away. Everything is a matter of sale, even to the ferns, which are periodically cut down and disposed of for bedding to cattle. As only certain individuals, according to their heritable tenure, have the privilege of sending out animals to pick up a living in the Forest, and that within prescribed restrictions, there is a very general absence of animated nature; the result being a strange condition of deadness and profound silence. Entering the denser parts of

Boldrewood, from which domesticated animals are excluded, we pass vistas with trees of majestic grandeur. An oak was pointed out with a stem of more than twenty-two feet in circumference, and which I conjectured was at least five hundred years old. Such trees, with twisted and wide-spreading boughs, have formed a favourite study for those artistic and much-admired sketches of New Forest scenes that are now publicly exhibited in London. Latterly, from the absence of deer to eat down the underwood, some of the denser parts of the Forest are beginning to be choked with bushes of holly and other plants of natural growth.

On the outskirts of Boldrewood, as in sundry other places, we come upon districts inclosed with turf dykes and palings, and devoted altogether to plantations of the common Scotch fir. Some of these plantations are pretty well grown, others are in their infancy, and for the most part they seem to be thriving and well attended to as respects thinning and surface drainage. This species of pine is about the poorest of growing timber, and valueless for any purpose where durability is required. Among Scottish planters it has been superseded by larch, as more tough and imperishable, and well adapted for railway sleepers. The fir, however, being an evergreen, is useful for imparting shelter, and can be grown on thin soils where oak and beech would perish. The extensive growth of firs in the New Forest has been objected to—almost execrated—as detrimental to sylvan beauty; but I apprehend that in certain portions of land no other wood could be successfully reared. The thinnings, I was informed, are readily sold as underground props for coal-pits. That the government, as a matter of business, should carry on the growth of props for coal-pits, is a question that may invite remark.

The weather having become chilly and moist, we had rather a cold ride in a south-easterly direction by Brockenhurst to Beaulieu, and about midway had to cross the railway from Southampton to Dorchester, which, turning and winding, may be said to cut the New Forest in two. Brockenhurst is a genuine old Forest village, off the beaten track, and is so embosomed among trees that you come upon it quite suddenly. After this, southwards, the country begins to get bleak-looking, and at length it degenerates into a great black heath, across which the road stretches till it seems to die away in a point. Not a sheep, nor a cow, not even a bird, is visible. You are in a broad desert, barren and cheerless. The surface is a kind of scraggy turf, bristling with heather, resting on a hard subsoil of chalk and flinty stones, the very riddlings of creation. Whether it would be possible by any moderate expenditure of labour and capital to bring this wretched land into anything like profitable culture, I would not absolutely determine. We see wonderful things done at Woking, and similarly dreary spots, by squatters, who contrive, out of very unpromising land, to make pretty and productive gardens. One thing is very certain, that the heaths in the Forest are condemned to sterility by the practice of skinning off the turf for fuel. This may be tolerated under some old law, but I have seen nothing more suicidal since visiting the island of Foula, which lies in the far 'melancholy main' westward from Shetland. What in desperation of circumstances may be pitied and excusable in

that inclement solitude, is, I think, little else than a crime in the south of England. At any cost or compensation, turf-cutting in the wilds of the New Forest ought to be peremptorily stopped.

Strangely enough, on getting to the outside of the heath, we all at once arrive at the boundary of as well-inclosed fields as can be seen in the Lothians, yielding fair crops of corn and hay to reward the diligence of the farmer. Here, in fact, we enter on the estate of Beaulieu, once pertaining to the abbey of that name, but which, in the progress of territorial change, has passed through various families, till it became the property of the ducal house of Buccleuch. The village of Beaulieu lies in a valley to which penetrates a creek of the sea. On the eastern side of the creek, amidst trees, are the ruins of the abbey, and near them, overlooking the water, is the recently renewed mansion, occupied by Lord Henry Scott. Although the abbey has been destroyed, we are enabled to trace out its gigantic proportions. The old church is roofless, and so are the cloisters, partly clothed in ivy, and still shewing architectural carvings beautiful in their decay. The great Hall, or refectory of the convent, with a groined roof, is in good preservation, and has been converted into the parish church. To the ecclesiologist, the whole surroundings offer objects of learned consideration; and all are liberally open to the visitor.

Having in a leisurely manner visited different parts of the Forest, I departed by railway to Southampton. For those who travel by rail there is convenient communication with Lyndhurst by an omnibus, which attends all the trains that stop at the station, a distance of about a mile and a half from the village.

I may sum up the result of my visit in a few concluding remarks. Looking at the New Forest as a whole, the impression left on my mind is, that as a property of the crown it is remarkably well managed, but that it is wholly out of sorts with the age, and always becoming more so. It has long outlived its original purpose, and as it now exists it is an anachronism. Were it like Epping Forest, near a large city, the teeming population of which would prize it as a holiday resort for health and recreation, there would be some rational meaning in its maintenance. From its position in an out-of-the-way part of the country, it can serve no such purpose. As far as I could see, it is little visited by strangers; there being indeed very imperfect means of accommodating them. The persons from a distance who feel the deepest interest in the Forest are artists, who resort to it for studies of trees and woodland scenery. In this respect, it fulfils an important use, not to be treated lightly. I would submit, however, that for all the purposes of the artist, Boldrewood and a few other special parts might amply suffice, supplemented by the lawn scenery of private proprietors. It seems to me too much to ask that the entire Forest, in which, as shewn, there are large tracts of no artistic value whatever, should be preserved as a matter of aesthetics. There are thousands of charming sites for villas, many thousands of acres of land that might be reclaimable, were the property held on the ordinary tenure. It is unfortunately excluded from the general market, and is either valueless, or productive of an insignificant return. In an age of

pushing adventure, and with a redundancy of capital seeking an outlet, is this a state of affairs to command public approbation?

The Commissioners charged with the administration of the Forest, no doubt do their very best. But they are in a false position. They are hampered by antiquated rights and obligations; and it does not surprise us to hear that extensive changes are hinted at. The New Forest, as a piece of crown property, must be felt to be somewhat in the nature of an encumbrance. Just think of the British government, whose power is felt at the ends of the earth, being obliged to plant fir-trees to be sold as props in coal-pits, to make a bustling trade of selling bundles of firewood, and to cut and dispose of withered ferns as bedding for cattle at so much the cart-load! Yet the proprietorship of the New Forest, as I have reason to believe, imposes these and some other paltry obligations, which few landed gentlemen in their private capacity would like to encounter. Admiring various spots in this ancient Forest, we would counsel no rash or sweeping change. Let renovations be brought about temperately and gradually, so as to bring the district into harmony with the rest of the country. And such renovations will doubtless come sooner or later. England is not so large a territory, as that its people should look with indifference to a huge section of one of its best counties being permanently set aside as a wilderness merely on grounds of sentiment.

W. C.

## STEPHEN BELL, THE USHER.

IN EIGHT CHAPTERS.—CHAPTER VII.

BELL had calculated almost every possible chance, and when they neared Briar House, he remained with Mr Trenlee behind the screen of a stone fence, and sent forward Willand, who would not be known to Prior, should the latter be there. His instructions were to force his way in if any objection were made, and keep the door until Bell, who could see his movements from where he stood, joined him. To the horror of Mr Trenlee, whose taste ran by no means in such a direction, the usher, as soon as Willand had started, quietly took a revolver from his pocket, made a hasty inspection of it, and then put it back again.

'My dear sir'—Trenlee began, intending to remonstrate against this awful illegality.

But Bell said hurriedly: 'It is all right; he has the door open now, and is speaking to some one inside.' He walked swiftly from his shelter, and, followed by the clerk, was soon at the side of Willand. No opposition whatever was made to their entrance, as it was quite taken for granted that they were the men whose arrival had been expected. Their first words, too, confirmed the impression, for Bell said boldly: 'Mrs Robinson?'

'All right,' returned Purvis; 'I'll go and see if she is ready. You mean to take her off at once, I suppose?'

'Certainly,' replied the usher; and as Purvis hurried up the stairs, he turned with a smile to

Trenlee, and murmured : ' All goes better than we could have expected.'

Trenlee, whose mind was still much troubled about the deadly instrument he had seen a minute or two before, smiled but feebly in return.

Purvis, as already has been said, interrupted the interview between Prior and the lady, telling the former that the men had arrived, and were ready to take the patient away at once. ' So much the better,' said Prior, ' for I believe she is meditating some desperate escape again.'

' Well, governor,' continued Purvis, ' then you had better see her off—I'll send the parties up.'

' No—no !' exclaimed Prior hastily ; ' I think not. If I am in sight, she will never cease her appeals and reproaches, and may say some things I would rather these men should not hear. If I am away, she will know it to be hopeless, and will probably be obstinate and quiet.'

' There you are altogether wrong, master,' returned Purvis ; ' it's the sight of you as makes her dumb. These parties, too, may want some instructions.'

' Not from me,' said Prior ; ' in fact, they have never seen me, and don't know me. I have settled with their principal, and he has given them every needful instruction. I will go out by the back, and walk on the heath until she is gone ; it will avoid a scene. I shall see the fly go down the road with her, and then I will return. There—enough !' he exclaimed, as Purvis opened his lips to speak ; ' I mean to see as little of this business as possible.' Without another word he turned abruptly from the keeper, and disappeared down a corridor which led to the rear of the house.

Purvis looked after him with a sneer on his face, and muttered : ' You're a cure, you are. I wish the woman had put a knife in you when once you had paid me ; blow me, if I don't. Or else,' he added, with a still uglier sneer, ' you are preciously wide awake in not seeing the fellows ; if they've got their orders c'rect, and carry them out, perhaps it's as well they shouldn't see you.—Here, Missis Robinson !' he cried, throwing open the door of the prisoner's room ; ' here's your new friends. I hope you will like 'em better than your old ones. Me and my missis have been a deal too kind to you, and spoilt you ; them parties won't, I'll bet a dollar. There, don't stare at me, but get your things on, and be off.' He left the room, and rejoined the strangers, one of whom was nearer than he had anticipated, for Bell had crept stealthily to the head of the stairs, listening eagerly for the slightest indication of treachery or alarm.

' Oh, you're here, are you ?' said Purvis ; ' well, there is her room. There's her boxes, down below. You will have to get her away yourself ; I'm not paid for that, and you are, you know.'

' All right,' returned Bell. ' Is any one with her ?'

' No,' was the reply ; ' the governor's gone out.'

' Perhaps,' continued the usher, ' you would not mind sending one of your people to the turn in the road ; he will find a coach there. Let him say the gentlemen from the station are ready.'

Purvis hesitated for a moment, and seemed inclined to argue that this also was not in the bond ; however, he nodded an assent, and left ; and then Bell, turning pale for the first time since he had been in the house, knocked at the door of the room indicated, and entered.

He found the poor lady now standing in the farthest corner of the room, her hands clasped, and her lips trembling with fear. She shuddered, and uttered a sound, which was almost a shriek, as Bell entered. He hesitated a little, as though disappointed at not being recognised, but recovering himself, said : ' Be not alarmed ; if you knew who spoke to you, and why I am here, you would not fear.'

' It is many a long day since any one has spoken to me as you have now spoken,' she said ; ' but I know your errand, and know your trade. Even if of kinder nature than those who have hitherto been my jailers, it is your business to be deaf to every appeal and cry I may utter, though they have long, long ceased to pass my lips.'

' My—madam,' said Bell, checking himself, ' you do not know my errand. I dread to be abrupt in my speech, yet time presses ; and while I fear to give a sudden shock, yet I must at once say why I have come.'

' I thank you for your delicacy,' interrupted the lady—or, as she had now better be styled, Mrs Maylis ; ' but you may proceed without fear. Others have been less considerate, and I know my doom. I am to be removed this day to a still lonelier spot, even this gloomy prison being considered too cheerful. Are you not to be one of my attendants ?'

' I hope so,' returned the usher. ' But my dear Kate Mrs Maylis, I mean, pray, summon fortitude to bear with good news and hope, as firmly as you so long have borne with evil fortune.'

She did not speak, but seemed by the motion of her lips to be repeating his last phrase.

' Ah ! my poor suffering'—he involuntarily began, but again checked himself. He approached her reverentially, as he went on : ' You are free. Those in charge of you now are your friends—friends who would die to save you ; and happiness is in store.'

' Is my husband forming some new treachery ?' she said, with her searching eyes full upon the speaker's face ; ' and why does it take this form ?'

' Madam, you are free,' returned Bell ; ' liberty and happiness are before you.'

' I do not understand you, sir,' she said ; ' I can never know happiness again ; and where friends are to come from, Heaven only knows.'

' Ah ! do not shrink from me,' exclaimed Bell, who had drawn closer to her, ' nor deem that you have no friends— that there are none to whom you are near and dear. I dare not tell you all, lest the shock should be too great ; but this you may know, that your infamous imprisonment is ended, and that you may look to me for protection. Poor girl !'

' I thank you very much for your sympathy,' said Mrs Maylis ; ' but I do not understand all you say, nor do I know why you should be desirous to serve me.'

' Because—because,' said the usher, and do what he could a sob would rise in his throat—' it is—O Kate !' he cried, and tears broke forth at last, ' it

is because I am your father!' And, as he spoke, he dropped into a chair, and, burying his face in his hands, broke into an uncontrollable burst of hysterical sobbing.

His daughter had recoiled at first, but, carried away by his excitement, and moved perhaps by the sympathy of a woman with grief, she sank on her knees by his side, and drawing one of his hands from before his face, took it tenderly in her own. The opening of the door roused Bell; it was Mr Trenlee who entered. 'You will excuse my intrusion,' said the old clerk; 'but the fly has arrived, and we have no time to spare. You know every moment is precious.'

'It is—it is,' exclaimed Bell, rising, with all his old decision and sternness again in his face. 'We are here, Kate, by a ruse. Fear not that in any case we shall leave you; but if we are not clear in a few minutes, we may have to fight our way out. This I should do without hesitation, and if blood be shed, let it rest on the heads of those who provoke it; but, for your sake, I would avoid the use of force. Can you trust me? I am to you yet a stranger; you have only my words to vouch for the truth of my improbable tale; and you have been bitterly deceived. Doubt would be natural to you; but, O Kate! say you can trust me.'

She looked at him for an instant with those mournful, penetrating eyes, and then said: 'I will; I do. You are honourable, I am sure; and I will go with you where you will.'

'Thank Heaven!' exclaimed Bell; 'and ere many hours you will have still greater cause to believe.—Now, Trenlee.'

In a very few moments Mrs Maylis was equipped for the journey, her luggage was placed in the fly, all was ready; but she lingered a little, hesitated, and then said timidly to Bell: 'Is it trivial or out of place for me to think of a bird? My only solace and companion for years has been this poor canary. May I take him?'

'Take him!' echoed Bell; 'I would not have had you leave him for the world.—Here, Willand, take this cage; that is right.—Now, is there anything else you would be sorry to leave behind?'

'No,' said Mrs Maylis, with a sad smile; 'my bird is the only thing here I have been attached to.'

They were now in the hall; Willand, with an air of carelessness, was lolling against the door-post, so that no sudden suspicion on the part of Purvis could cause the closing of the door, until, at any rate, the stalwart form of the young man was removed. The keeper and his wife, with two or three servants, had gathered to see their inmate depart, when, after a little whispering, Purvis came forward as Bell moved to the door, and said: 'You'll excuse me—but who is the old party with you? The governor said there was to be only two.'

'Is it of any consequence to you who he is?' demanded Bell, in his sternest manner. 'If you know your business half as well as you should do by this time, you ought to know that the fewer questions you ask the better.'

Purvis shrank back; but his better-half was not so easily cowed, and pushing forward, said: 'If my husband was of my mind, that woman should not go until I knew something more about you.'

Bell felt the arm he held tremble at the sound

of the woman's voice, although it had been still enough while Purvis spoke. 'I never saw regulars behave like you,' continued the speaker; 'and if there ain't a screw loose somewhere, I'll be —.' The rounding off of this sentence was very vigorous and masculine in its style, but Mrs Purvis was quite as picturesque in her language as any one of the sterner sex. She proceeded: 'Either the governor is sold, or that party as you are a-taking away will find you precious deceitful, and will wish she was back at Briar House before many days are over. Mark what I say.'

During this speech, Trenlee had been adjusting the interior of the chaise, but he suddenly left his task, and stepping hurriedly to the side of Bell, said something in a frightened whisper, which caused the latter to cut short the eloquence of Mrs Purvis, and lead his companion at once to the vehicle.

Prior, as he had said he would do, left the house, and paced uneasily to and fro on the heath during the time which must elapse ere the coach could appear; every minute in this space seemed ten, and every possible horror which could attend the removal of the prisoner passed through his mind. At one time he fancied that even at the distance to which he had gone—nearly a mile—he could hear violent shrieks, and he pictured the patient struggling helplessly in the grasp of the keepers; when he strained every nerve again to catch the sounds, and all was silence, he fancied that a gag, or a blow, might have hushed the screams—for he knew the character of the men he had hired. 'I hope there will be no violence,' he muttered; 'I warned the doctor strictly, that until they got her safe home, they were to be very careful. It would be a dreadful thing if anything were to happen in the removal. Somebody would be sure to betray it, and then'— He resumed his patrol here, and walked up and down a piece of ground from which, without much chance of being seen himself, he could command the house, and the white road leading to the station. 'How tediously slow they are,' he muttered again. 'If all had gone well, they would have been out of the house long before this; and yet I don't know,' he added, glancing at his watch, which told him how long he had really been on the watch. 'I wish,' he began, 'I had not come down at all. I was foolish to do so; it always upsets me.'

At this moment a shout from behind him attracted his attention, and turning, he saw two tall powerful-looking fellows, each of whom carried a carpet-bag, approaching from the opposite side of the heath.

'Are we right for Briar House, master?' said one.

'Yes,' replied Prior, looking anxiously at the men. 'That is Briar House, on the rise before you.'

'Are you sure it is, master?' said the spokesman of the two, 'because we don't want no sell this time. None of your Yorkshire tricks.'

'What do you mean?' asked Prior, a vague feeling of alarm creeping over him.

'Why, I mean this,' said the other, who stopped and turned round to give more emphasis to his speech: 'one of your Yorkshire people has sent us a good four mile over this here common, after Briar House, where we ought to have been an hour ago. I don't want no larks like that. Is

that house Bill Purvis's or not? because it's Bill Purvis's house we want, whether it's Briar House or whether it isn't.

'Yes, my good fellow, that is Purvis's,' replied Prior, growing more uneasy every instant, although he could not tell why. 'As I know Mr Purvis very well, perhaps I may ask if you are strangers here, and if you have travelled far?'

'Travelled far!' echoed the fellow. 'We've come from four mile on the other side of London, and was to have been here— Come on, Curly,' he said, interrupting himself; 'it's no use a-talking now.'

'Stay one moment!' exclaimed Prior, whose cheeks, lips, and all, had turned white on hearing this last sentence. 'Have you come from Hammer-smith? Speak, idiots! and don't stare helplessly at me. Have you come from Dr Brymmer? You called him Curly. Is your name Nicks?'

All this was asked in such a hurried yet choked tone, his looks were so wild and terrified, that the man stared at him a few seconds without replying; at last he said: 'I don't talk of my business out of school; but you know all about it, it seems. We are the parties from Brymmer. Dr Brymmer, as you call him, and as he calls hisself, though when I first knew him'—

With an absolute yell of rage and terror, Prior threw up his hands wildly, and cried: 'Then I am betrayed and ruined! Some villains have assumed your names, and are now in the house removing the patient. My name is Prior; I am your employer. What is to be done?'

'It's that old party! Strike me blind if it isn't!' said the man to his companion.—'Well, governor, I don't know what's to be done. We shall be paid all the same, I suppose?'

'Paid! Hark ye,' said Prior; 'I will double and treble your pay if you will, at any hazard and at any damage, take her from the scoundrels. Join me. Are you armed?'

'We've got our life-preservers, of course; they will do, I daresay,' returned the man.

'Then, if you want to earn fifty pounds apiece for five minutes' work, follow me,' said Prior. 'Throw your bags down there—no one will see them; and if they are lost, I will pay their value twice over. Come!'

Without further discussion, they ran at speed down the incline, and had crossed the greater part of the intervening space when Trenlee saw them.

His whisper to Bell was: 'For Heaven's sake, make haste! The keepers I threw off the scent are running down the heath at the back of the house, and will be here directly.'

In another minute they were all in the fly, and driving from the court-yard, but in rounding the side of the house they came for a moment nearer the men, who were easily to be seen and recognised now. Trenlee and Bell were standing up in the carriage, and looking towards them; Mrs Maylis, at Trenlee's suggestion, was reclining under the hood, so screened that she could neither see nor be seen. The men made frantic gestures as they saw the fly draw from the premises, and Bell said in a low tone to his companion: 'As I thought—that scoundrel Prior is with them.'

'Prior! Is he Prior?' exclaimed Trenlee, as he took his glass from his eye. 'We shall be followed! There is Purvis running from the back of the house to meet them. We shall be

followed, Bell, for the man you call Prior is her husband, Captain Maylis.'

'Is he?' returned Bell in a tone which, though subdued enough, made the old clerk shudder. 'Then his fate is in his own hands, for, if he follows and overtakes us, I'll shoot him like a dog. I will; I swear it! He dies, if he comes near me this day!'

Purvis was now seen to run back to the house, and enter the stables, and then another man went to the kennels where the mastiffs were kept.

'They will be after us directly,' said Bell.

'Can your horse go?' suddenly demanded Trenlee of the driver.

'Yes,' said the man.

'Then turn short off here,' continued the clerk, 'and drive as hard as you can to Wanlee station: we will pay you well.'

In an instant the thong sounded on the flanks of the horse, which, breaking into a very fair gallop, rattled the coach along on its new journey.

'At Wanlee station,' continued Trenlee, addressing Bell, 'we shall just catch the fast train which passes Rittle without stopping. We shall barely do it, and the time our pursuers will lose in going on to Rittle station will certainly throw them out. There is no train then for half an hour, and then it is a stopping one; so we shall be at Onslope fully four hours before they can possibly reach it.'

'Good,' said Bell. 'I am as anxious as yourself to get away peaceably.—It is only right to tell you, driver,' he continued, 'that we may be followed by those who have no right to meddle with us, and that we shall resist them. We, of course, do not wish you to risk anything by interfering, and if any injury is done to your horse or vehicle, we shall make amends.'

'Thank 'ee, sir,' replied the driver, who was a bluff-looking Yorkshireman, and a fitting partner for Willand, who sat beside him on the box; 'but if it's that hang-dog Bill Purvis as be coming, wi' your leave, I'll have a coot at un mysen.'

Bell smiled at finding this unexpected ally; while Trenlee ejaculated: 'Bless me! how fond of fighting the man must be!'

At this moment a gap in the wood which skirted the road afforded a glimpse of Briar House and the vicinity; the driver only, who of course knew the country best, caught sight of it, but he exclaimed: 'They be out all in full croy! There's the gig an' two saddle-horses, and them mastiff dogs. If they coom oop wi' us, we shall have a tussle. Coom oop!' With this he lashed his horse afresh, and on at a hard gallop they went.

There was very little more spoken along the road; Bell stood up all the way, looking anxiously behind them, but the road lying low, and being lined with trees, they could see nothing of those they dreaded, and could not guess whether they had gone on to Rittle, or by some unlucky chance had found out the change at once. The five miles to Wanlee station were soon covered; but as they drove down the last stretch of the road, they saw the white puffs of steam rising above a cutting at no great distance, and it was doubtful if they would catch the fast train. With more lashes than were good for the horse, and more Yorkshire oaths than were good for himself, the driver drew up at the station door just as the engine glided by the side of the platform. No time was to be lost:

Willand took the tickets, while Bell assisted the lady to alight; her pallid face shewed that she had heard and comprehended all. In another minute they were all seated in the train, the driver of the fly having been dismissed with a handsome gratuity. The guard sounded his tremulous whistle, the engine answered with its scream, and with thankful hearts our party felt the first tug which sets the train in motion. The guard, walking by the side of the slowly moving carriages, to have the last possible moment for chat with the station people—as is the wont of guards—happened to cast his eyes behind him just as the quickened way of the train forced him to break into a trot.

'Why, there's a regular mob a-coming down to the station,' he exclaimed; 'a trap, and two or three horses, and they're a-waving handkerchiefs and everything. Well, they're too late now.—Good-day, Jack.' Then, springing into his box, he craned his neck out to watch the party of which he had spoken, and just ere his carriage disappeared round the curve, he saw them rush on to the empty platform.

#### CHAPTER VIII.

The ride to Onslope was a long one, as the reader knows, yet very little was said on the way. Mrs Maylis, by a reaction, natural after the violent excitement of the day, became very melancholy and dispirited, but she would not hear of any proposal to break the journey. She wished 'to go home,' she said; although she could not have had the faintest idea as to the kind of home they were taking her to, or what sort of resting-place she would find it. As they neared Onslope, this last idea became painfully vivid to Bell, and he gently told her that he was not a rich man, and that her residence for the present would be in his humble lodgings. She motioned him to silence with her hand, and then said something in so low a tone that Bell could not hear; he bent his ear to her lips, and caught the words: 'I have confidence in you; I shall be happy anywhere with you—father.'

Bell pressed her hand, and spoke no more until they arrived at Onslope.

A moment's discussion between Trendee and Bell settled one point, which was, that they should drive in the first instance to the lodge—sending on Willand in advance, to prepare the inmates for their coming—there, each knew, the stranger would be sure of sympathy—and thither, in the familiar *Oakmount Arms* fly, they went. The driver of the said fly asked a question as they entered his vehicle, which he would probably have spared if he had known all. 'Hope you're well, sir,' said the man, touching his hat to Bell. 'Have you seen anything of Mr Prior lately, sir? The *Arms* don't seem the same place without him; so free and lively a gent as he was.' A brief negative was the reply, and the man continued, as he closed the door: 'Sorry for that, sir; I was in hopes you had brought him back with you, as I knew you was such constant friends.'

Trendee explained to Mrs Maylis, during their brief ride, that she was going to see kindly, although very plain people; honest, honourable, and true, who would be pleased to make her forget, by their sympathy, all she had gone

through. She listened, and smiled; but hers was a very sad smile; and soon the vehicle stopped at the gates of a large park, where stood, evidently awaiting their coming, a big burly, white-haired old man, who held by the hand a very handsome, slender boy of some ten years old. As she saw them, Bell's watchful glance saw also a thrill pass through her, and a momentary flash come into her eyes; but it faded away, and with a sigh and a smile, she prepared to alight. The bluff old yeoman stepped forward, and assisted her from the carriage, lifting her—white-haired though he was—with as much ease as if she had been a child. 'You are heartily welcome, ma'am, to Oakmount Lodge,' he said, raising his straw hat as he spoke; and then, turning to Bell, he wrung his hand for a moment in silence.

It was as nearly dark as summer night ever is, when Mrs Maylis entered the lodge, and found in the neat parlour a woman about her own age, or a little older, dressed in black silk, with—as she noticed even at the first glance—a watch and chain conspicuously displayed. 'My daughter Priscilla, ma'am,' said the keeper.

'And my best friend, and, until to-day, my only one,' added Bell.

It was proposed that Mrs Maylis, tired as she must be, should retire to rest at once; but she begged to rejoin them after she had refreshed herself with the traveller's greatest luxury, cold water; for she said that an hour spent in quiet conversation where she felt safe, where all were friends, and where no jailer could intrude, would not only be greater happiness than she had known for years, but would soothe her mind and procure her rest. So she was shewn the little white bedroom which it was arranged she should that night occupy, and which was inside Priscilla's, so that no one could come to her room without first passing through Miss Lamsett's. To one who peopled the air with pursuers, and saw a lurking enemy in every distant shade, this was in itself an assurance of safety, which was heightened by the homely peaceful air of everything around; and by the kind although rather deferential manner of the keeper's daughter. It would have been difficult for Mrs Maylis to explain how she came by the knowledge, but although no more had been said in any way bearing on the subject than the few words uttered by Bell as an introduction, she knew as well, ere she descended to the little parlour again, that Priscilla Lamsett was engaged to be married to her father, as though she had heard it stated by each of them.

Had it not been for the presence of Mr Trendee, a very constrained air would have pervaded the party so strangely met; but the old clerk was, or feigned to be, in capital spirits, despite his recent fatigues, and, he chatted easily and freely about the beauty of the park when seen by daylight, the number of years Mr Lamsett had served the Earls of Oakmount; then, by a very slight and natural allusion, he drew the old keeper on to tell how he first came to know much of Mr Bell; how the latter happened to walk through the park while Mr Rule the surveyor was insisting on some plan which the keeper knew was wrong—how Lamsett, recognising one of the masters from Hanover House, had appealed to him, and how Master Bell proved himself a better arguer and drawer-out of plans than the surveyor. 'And if

you'll believe me, ma'am,' concluded the old man, 'his lordship was a-standing by all the while, as pleased as Punch; and he thanked Mr Bell most heartily when all was over, and told me that the park and the ponds were always to be open to him.'

The conversation after this became general and free, until an interruption was caused by the entrance of the slender boy who had attracted the notice of Mrs Maylis at the gate; he came in under the guidance of Mary, the little servant, to say 'good-night' in childish fashion, and to kiss Priscilla.

'And have you not a kiss for me?' said Mrs Maylis.

'Yes,' answered the boy, and went very boldly to the strange lady, who kissed him more than once, and held him for a moment at arm's length, ere, with another sigh, she released him.

'Who is that dear little boy?' she asked, as Alfred disappeared. 'Not your son, I presume?' she added, speaking to Mr Lamsett.

The old keeper got out the first words of a negative answer; and Bell was about to make some ambiguous speech, which might serve to pave the way for a further disclosure, when Trenlee rose and said: '*Madam, that dear little boy is—YOUR SON.*'

Joy never kills, and the shock given to Mrs Maylis by the abrupt announcement of Trenlee, was so quickly surmounted, that on the very next day she was seen walking with her father and little Reginald, as we must now call him, in the leafy glades of Oakmount Park, and sailing in the skiff upon the lake. It would be of no use to dwell on the deadly shudder which ran through her frame, ever and anon, when she thought of the worse than jail from which she had been released; or the fear that kept haunting her, that she would shortly awake, to find all this a dream. No one could pass so suddenly from such a terrible existence to a life full of light, and hope, and happiness, without being often reminded of the fetters which had so lately been struck off.

There was trouble in anticipation, too, for them, as there was the baffled ambition and hate of Captain Maylis to be feared, turned now, as it doubtless was, into a longing for revenge. Such belief in the reality of his hate did Bell entertain, that he made his daughter promise never to leave his lodgings, whither she at once removed, unless he or Mr Trenlee were with her; he felt that a certain amount of dread of himself would be entertained, especially as he took good care to let it be known that he always went armed; while as for Trenlee, although he was old, he was a lawyer, and Bell was right in supposing that fact to be a tolerable safeguard. Trenlee, however, despised all these fears, and made a jest of their precautions; he knew the position better than they did, he said, and that they held all the trump cards. Maine, Firth, and Maine could not afford to mix themselves up with a public scandal, whatever they might do with a private one; while such an exposé as the violence Bell dreaded, or even a lawsuit, would almost ruin the bank of Maylis, Maylis and Company, which was chiefly supported by the High Church people. At his dictation, Bell wrote what seemed to the latter a very tame and colourless letter, which was sent to the great

lawyers; and with what patience he could muster, he awaited the result.

As Trenlee had foretold, in a very few days they had a communication from Maine, Firth, and Maine—for the style of the firm was kept up, although the chief partner had retired—requesting Bell to call at the West End house where he had before seen the lawyer. This time he saw Mr Firth, a very different sort of person, he being a tall, large-whiskered man, who had a domineering way with him, much calculated to impress the timid, but of very little service with a man like the ex-usher from Hanover House. The lawyer adopted very little of the circumlocution usually attributed to his craft, but went straight to work, admitting in the outset that he received his instructions from Sir Reginald Maylis; and the tone of the discussion may be gathered from a few sentences near its close. 'Then you still maintain that this young woman is the wife of Captain Maylis?' said the lawyer sternly; 'and you mean to proceed on that assumption?'

'I do,' returned Bell.

'Now, come!' exclaimed Mr Firth, suddenly changing his tone; 'you are a business man, I can see, and so am I. It will answer your purpose better, I do not hesitate to say, if you will drop this claim. Sir Reginald is rich, and can pay, and I will promise that he shall pay. Now, let us see what we can do.'

'You have brought me up to London for nothing,' said Bell, 'if you can only fall back upon such a proposal; at least half-a-dozen times have you broached it in some form, and I have repudiated it as often. I do so again. My daughter is Captain Maylis's wife, and has been recognised as such by hundreds of persons.'

'By the way,' said the lawyer, 'it has never been explained why your daughter was described as Katharine Rose Dainton, while your name is Bell.'

'My name is not Bell,' said the other calmly; 'but I need not point out to you that my using a feigned name does not invalidate my daughter's marriage.'

The lawyer smiled slightly, paused for a moment, and then said: 'Well, I do not see that we can do any good by prolonging this discussion. I shall report your determination to Sir Reginald, and take his instructions.'

The usher had been secretly admiring the foresight of Trenlee, who had told him almost exactly what course would be taken by the lawyer; and his own reply was in accordance with advice from the same authority. 'Do so,' he said, 'and tell him that I do not mind disclosing my intentions even to an enemy's solicitor. Money I want less than you seem to suppose; my daughter and her child can live without aid from Captain Maylis; but he knows, and you know better still, what offences he has committed, and in eight-and-forty hours from this time, if he is to be found in England, he shall be arrested. I bid you good-evening, sir.'

'Mr Bell—I beg pardon, Mr Dainton,' said the lawyer, rising, and displaying more excitement than he had hitherto done, 'I must ask you to grant me one favour, and I know your word may be relied on: promise that for the forty-eight hours you speak of no proceedings shall be commenced against Captain Maylis, and I promise in return, that within that time you shall have an

answer from Sir Reginald, and that no advantage of the delay shall be taken.'

Bell gave the required pledge; and the lawyer took leave of him with a warmth which contrasted very much with his demeanour during the earlier part of the interview.

Trenlee was much pleased when he heard Bell's account of what had passed, but admitted that the instantaneous collapse of the lawyer exceeded his utmost hopes, and indeed somewhat puzzled him. But Mr Firth kept his promise. Ere the two days had expired, a large official-looking envelope arrived by post at Bell's lodgings, and this contained a formal offer on the part of Sir Reginald Maylis, to prevent any further interference with Mrs Maylis. She was so styled in the deed, and fully recognised; her son was to remain in her care, unless she preferred his being with Sir Reginald, who would then take charge of him; a large annuity was secured to her, and ample provision made for the boy.

Though a fear and dread hung about her husband's name, the unfortunate lady sought no vengeance for all she had suffered, and would have been only too glad to consent to any terms that would allow her to dwell in peace. Everything was left to her father's judgment, and he hesitated not a day in closing with the baronet's proposal. It was soon seen why such anxiety was displayed to prevent even the commencement of legal proceedings against Captain Maylis; and the revelation greatly delighted Trenlee, who had insisted all along that there was something behind the scenes. Captain Maylis was returned to parliament for a borough where the bank possessed great influence, and there was quite a flourish of trumpets in the papers on his side as to the great accession of practical knowledge and sound judgment which the political world would receive from such a man. They—the papers aforesaid—were authorised, too, to contradict in the most direct manner certain rumours which had crept into circulation, relative to an alliance between the honourable and gallant member and a certain beautiful scion of aristocracy; no such alliance was on the tapis, and those who promulgated such reports shewed an entire ignorance of the matter.

When, after the lapse of some years, the old banker died, and his son became Sir Reginald, Bell was sounded by an agent from the firm of Maine, Firth, and Maine, to ascertain if Mrs Maylis were willing to give up Reginald, who was by this time growing out of boyhood. But the mother and son clung too closely to each other; the offer was rejected, and was never renewed.

There is very little left now to tell. Bell, as we still call him, although he adopted his real name of Dainton, gave up his situation at Hanover House, to the annoyance of those who had speculated upon him as a continual deputy for vacation duty; and in a very short time married Miss Priscilla Lamsett. They lived in a house adjoining one occupied by Mrs Maylis, at a pretty little town some half-a-dozen miles from Ouslope. They did not go farther away, because Priscilla wished to see her father frequently; while, although it was only a forty minutes' drive from the lodge, yet, being in a cross-road, they were almost as free from the intrusion and curiosity of those who had known them at Ouslope, as though they had moved fifty miles away. The usher

was never known to tell so much of his past life—even to his wife, of whom he was extremely fond—as he had told to little Alfred Rainwood on the morning they sat by the lake.

When old Lamsett died, he proved to be a much richer man even than his neighbours had decided he ought to be, although neighbours in such a case usually go pretty high. The larger portion of his means was left to Bell and Priscilla, who were in no need of it for themselves, but they were the possessors of a couple of little Bells, and the money, as the usher remarked, 'would come in nicely for them.' Trenlee lived with Mr and Mrs Bell until his death, which did not happen until he was some fourscore years of age; and the massy gold snuff-box, so prized by the old clerk, became an heirloom in Bell's family.

Bell never quite got over the cautious and suspicious habits he had been taught in a life of strife and danger; at anyrate, it was many years ere he ceased to come quietly out of his house, after all lights in the lower part were extinguished, and walk around the garden and outhouses, keeping as much in the shade as possible. He usually went through this ceremony armed, and once owned to Trenlee, who jested with him about it, that he never went out on the errand a single night, that he did not feel that Maylis was lurking in the grounds. It never was so, but had such an event really occurred, there might have been a risk of the political world losing one of its 'brightest ornaments.'

#### THE BIRDS OF THE POLAR REGION.

WHILE the Arctic Expedition is absent, its many well-wishers will often, in imagination, place themselves in the company of the heroes, will sail beneath frowning icebergs with them, and even lend a hand in tugging the sledges over the rough ice-fields. Thanks to the records of previous adventurers, and to the artist's facile pencil, we seem perfectly at home amongst the frozen solitudes over which lies the track to the north pole. The difficulty of realising these regions lies rather in being able to figure to the mind the particular aspects of the kingdom of ice, the mosses, lichens, vegetation, insects, &c. which will meet the explorers' eyes. At the first blush, it might be supposed that the severe cold would be fatal to all insect life, yet Otho Fabricius collected sixty-three species of insects during a residence of six years in Greenland. In the still higher latitude of Winter Harbour only six species of insects were found by Sir E. Parry during his stay from September till the following August. But insects do not require for their existence a continuous period of warm weather, so much as hot weather during some time of their little lives, so that it is perfectly conceivable that high up in Smith's Sound, during the brief summer, a few insects may be obtained. The mosquito, it is known, cannot live in the latitude of Melville Island, so that this pest at all events will be conspicuously absent from the difficulties of the expedition. Vegetation is meagre enough north of Disco. Considering the extreme cold that is to be encountered, an interesting question arises regarding the birds that may possibly be discovered by

the arctic voyagers. In our conjectures on the point, a very competent authority comes to our assistance. Scientific manuals on the physical and natural history of the arctic regions were compiled for the present expedition, and Professor Newton wrote a paper amongst them on the Birds of Greenland, from which we will borrow the main features of that country's avifauna, in order to illustrate our subject. The phenomena connected with the appearance and departure of several of the migratory birds which visit Greenland, open many very interesting questions, and the scientific staff on board the *Alert* and *Discovery* will pay especial attention to these questions. A few of them may here in the first place be indicated.

Among the dozen gulls or thereabouts which frequent the fur-producing countries of North America, one of the most graceful and beautifully coloured is Sabine's Gull (*Larus Sabini*), discovered, as its name imports, by Captain E. Sabine off the west coast of Greenland. This bird was met by Sir E. Parry in Prince Regent's Inlet, and again on Melville Peninsula. It arrives in high northern latitudes in June; but why should it—as it does—depart again so early as the month of August? Has it accomplished nidification, and finds no further need of staying in the frozen north for a longer period? Or does the first breath of winter deter it from a longer stay, as the early frosts of October quicken the departure of our swallows? A bird so elegantly fashioned as Sabine's gull, with its forked tail, jet black collar, and the curiously versatile colours of its head, a tinge of black, brown, blue, or purple overspreading it, according to the light in which it is viewed, should invite inquiries as to its life-history; and doubtless we shall be wiser on this point should the present expedition return safely.

Again, what a curious history is that of the Great Auk (*Alca impennis*). It has had an existence, as known to science, of rather less than three hundred years, and now, as it is feared, has become extinct. First discovered in 1574 by an Iclander named Clemens in Danell's Islands, off the east coast of Greenland, a large colony of the garefowl, as it was termed, lived on the Gairfowlskerri, near Cape Reykjanes. In 1830 a volcanic eruption caused this reef to be swallowed up by the sea, the survivors of the garefowl escaping to the island of Eldey. With the exception of a few stuffed birds in different museums, and some of their eggs, the rest of this auk's history is contained in scattered notices of its occurrence in the Faroe Islands, North America, and Greenland, and even on a few points of Great Britain. Its last appearances on our shores were at Papa Westra, Orkney, 1812; St Kilda, 1822; Lundy Island, 1829; and in 1844 at the long strand of Castle Freke in Ireland, where one was picked up soaked with water after a storm, though in 1845 a report was prevalent that a pair had been seen in Belfast Bay. At Eldey, off Iceland, a male and female were killed in 1844; these are the last known in Iceland. Its bones are found in Funk Island, off the coast of Newfoundland; and quite recently, traces of them have been discovered in Jutland, and again in Caithness. And so ends the romance of the Great Auk. Originally a wingless arctic bird, it floats and dives into more southern latitudes till it falls under the ken of man. Ill fitted by its habits to contend with his weapons of destruction, it gradually fades away before civiliza-

tion, and Nature herself seeming to aid in its extinction, disappears altogether in 1844 from his horizon. As the legend which Kingsley has so gracefully embodied in the *Water-babies* makes it come years ago from 'Shiney Wall, where it was decently cold, and the climate fit for gentlefolks,' will the present Arctic Expedition have the glory of rediscovering this bird in its original haunts? At anyrate, any particulars which can be collected concerning its history will be looked for by all ornithologists with great eagerness. Another very rare bird, Ross's Gull (*Rhodostethia rosea*), of which only seven or eight examples have been seen, may be looked for in Smith's Sound. Three of these specimens were shot in Disco Bay.

Another interesting question, lately referred to in our columns, and which it may be hoped will be solved by our arctic heroes, relates to the breeding-place of the Knot (*Tringa Canutus*), a little bird very well known to all dwellers on the east coast of England. This bird is about the size of a large snipe, and throngs during autumn and spring our own coasts, as well as those of Europe and North America. It must breed in large numbers somewhere in the arctic regions, for it regularly retires northward for that purpose, and has been tracked north of Iceland. It has not been seen on the east coast of Greenland, nor yet on Spitzbergen; it is supposed, therefore, that the countries to the west and north of Greenland are the goal of its northward migration. On the hypothesis of an open circumpolar sea, it is possible that the breeding-haunts of this little bird may be found on its comparatively milder shores. At anyrate, some contributions may be obtained towards a solution of the singular migratory movements of the bird. We have as yet spoken only of its northward migration; but towards the end of summer, it returns to us in still greater numbers than before, both old and young birds together frequenting our shores, till inclement cold weather drives them very far southward, until the following spring.

The ordinary birds of Greenland are pretty well known, thanks to the labours of foreign naturalists, and the observations made by Parry, Ross, and McClintock. Professor Newton catalogues them as about sixty-three, while some sixty-two more have been occasionally taken there. The majority are, as might be expected, littoral and aquatic birds. From these denizens of Greenland a selection of thirty-six is made, which he deems, from a consideration of their life-histories elsewhere, and from various facts which seem to bear on their geographical range, may very likely be met in the extreme arctic regions. At the same time, he frankly avows that 'if the expedition meets with thirty species in Smith's Sound, it will surpass expectation.' Writing, however, as Professor Newton does, for the crews of the two ships, who cannot all be supposed to be ornithologists, though all would gladly further the interests of ornithology if they have a chance, it was as well to be liberal in his account of the species which science reasonably supposes may be found in the polar regions.

Opening summer in 1876 will discover, we may hope, the crew of the *Alert*, which has wintered high up in Smith's Sound some way north of her consort, cheerily starting, after the long dreary winter, to visit the depot of provisions which they

established some eighty miles north of their winter-quarters, by means of a sledge-journey lasting three weeks, in the middle of the previous September. Most persons either saw the sledges and equipments of the men at Portsmouth before the ships left, or are able to form a tolerably correct notion of them from the engravings which were then published. Probably but few dogs survive, the extreme cold of the winter having acted on them, as it is well known to do, much as excessive summer heat is wont to do on their relatives in more temperate climes. The blue-jackets, therefore, have harnessed themselves to the sledges as enthusiastically as they did to the guns in the Crimean war, and the party is slowly moving to the mysterious pole at the rate of about ten miles a day. Everywhere, green ice capped with white snow, a dreary waste, meets their eyes, while in front lies a rugged region of contorted and riven ice, broken up by the sea, and again frozen into grotesque forms, spanned by the 'water-sky' overhead, which tells of open water. The travellers are beyond the ordinary haunts of the polar bear; all is still, vast, colourless, and monotonous. On a sudden, what seems an animated bundle of snow-flakes rises into the clear gray sky on one side of the party, and on being shot, turns out to be a snowy owl, which had been picking the bones of a long-tailed duck. Both these birds have been shot in Scotland. Soon a 'gaggle' (as the little company would be termed in British sporting books) of Brent, or perhaps snow geese, wings its way athwart their path. A rock ptarmigan or two are brought down on the highest part of the day's journey, reminding several of the officers of bygone days on the peaks of the Western Highlands, when grouse would not lie in the corries below, and the only way to fill a bag was to climb for a chance at the ptarmigan on the mountains' brows. These are now eagerly welcomed, as an addition to the evening meal, and seem a link to bind their slayers still closer with the far-off delights of home. On, on, the weary travellers plod, conversation having ceased, the ringing of the steel-bound sledges on the hardened ice-crusts being often the only sound heard, and that so monotonous, as to conspire, together with the biting air, to render the party very drowsy. On a sudden a whistle of wings is heard, and up dash some plover, our familiar British gray plover, now in summer plumage, the little ringed dotterel of our sea-shores; or, perchance, a 'trip' of the American golden plover, distinguished from the well-known European bird by having the axillary plume under the wing gray instead of white; while a skua hovers on their flanks; and, most delightful now of all sights, because it is so homelike, on a neighbouring mass of granite and gravel—the moraine of some glacier which ages ago crawled down into the sea—sits a croaking raven. Omens are unthought of amidst the stern realities of arctic sledge-travelling. Its hoarse voice now sounds more delightful than ever sung the most melodious of nightingales in the copses of distant Oxfordshire.

May fancy track the little party further? Two hours more of their laborious dragging being over, they stand on the frozen sand of the great circumpolar ocean. Gray, dim, and weird-like, it stretches away to the pole in gentle swells, unruffled by any breeze, and apparently but slightly animated by

tidal force. Its vastness and its sad aspect, broken by no sail, and never yet visited by civilised man, awe the party into silence; but abundance of birds with their loud calls and vigorous swoops, soon destroy this sense of desolation; as on our own shores, the turnstone and the sanderling run up and down at the edge of the wavelets; sandpipers and phalaropes flock the distant flats; the arctic tern careers in mid-air, like the swallow of an English summer; eider-ducks, the little kittiwake, and the glaucous gull clamour in an adjoining inlet, where the great northern diver, the puffin, the guillemot, and the little auk are diving in all the exuberance of joy at the tardy blossoming of their cheerless summer. It is a busy scene, such as the ornithologists amongst the men remember to have seen off an Orkney skerry, or beneath the wave-lashed ledges of Donegal. While the tent is being erected, and they are looking over the unknown ocean before them with much the same longing eyes as did Sir S. Baker when he surveyed the vast and mysterious waters of the Nyanza Lake rolling towards him from the distant haze which closed in the west, a shout from one naturalist almost beside himself with delight, proclaims that he sees a couple of great auks stolidly contemplating him from a ledge of ice, and amazed at the intrusion! But here the work of fancy ends; and we must leave to the anxiously expected return of the expedition the exact particulars of this marvellous *rencontre* with the bird over whose existence hangs such a perplexing veil. We have performed our task, and indicated to the reader what species of birds may be met by England's heroes in the circumpolar regions.

#### A STORY ABOUT ILLEGIBLE WRITING.

WE were going to remove to another house, and my mother and I having lived for many years in the one we were about to quit, papers and trifles of all descriptions had accumulated in such inconvenient quantities, that we determined to give up an evening to sort the lumber, and to make a bonfire of that which we did not wish to keep. As we emptied old writing-desks, and drew forth letter after letter, sorting bookcases and other receptacles which contained pamphlets, and odds and ends of that kind, we would now and then pause over our labours, to con some yellow scrap of paper, or to find a bit of writing, perhaps devoid of envelope, and then carelessly throw them into the general heap.

As I was glancing over several letters which were packed away in a dear old workbox, now disused, I came on one which caused my heart to throb, I knew the writing so well; and all the other letters of the same writer, I treasured up in a particular casket, which on no account would I have permitted mortal hands to touch. There they had all lain for many a quiet year. I had been a young merry girl when they reached my hands. The penmanship was so extraordinarily like hieroglyphics, that I well remembered, in many instances, having impatiently thrown the letters down, exclaiming: 'If Gervase will persist in making himself illegible, I shall certainly not take the trouble to try and

translate his epistles ;' yet how I was interested in them all the while, and how I tried to guess the meaning, when it was impossible to make it out.

'I wonder,' observed my mother on such occasions, 'that a clever, highly educated young man like Gervase Markham has not learned to write better. How he will ever be able to read his own sermons, when he is called on to preach them, I cannot imagine.'

So, in the old workbox, I found one of his strangely scrawled epistles, which caused my heart to throb, as I have said. I had been seriously ill at the time when the date of it was new, and it had been placed in my workbox, and scarcely thought of again ; I never had attempted to decipher it, from long-continued weakness. It was, however, the last I ever received from Gervase Markham ; it had been a heart-break, and all was a dream of the past. What impelled me to open this old faded record of hopes and of fears, now ? what mysterious impulse urged me to scrutinise carefully the closely written pages ? closely written, but with characteristic illegibility. Probably, I had greater patience and experience than when that ink was fresh, for now I read and understood ; and with a faint sensation as of approaching death, I recollect holding the fatal document to my breast, and crying out : 'O mother, too late—too late !'

I suppose long insensibility succeeded, as, on recovering consciousness, I found the household assembled round me, and my dear mother, spectacles on nose, regarding the old letter which had caused such mischief, much as if it was a living thing, and had power to bite.

Gervase Markham was the younger son of a Monmouthshire baronet, and intended for the church. We were boy and girl when we first met at his father's house, and Gervase was a grave, sensitive youth, plain in person, but with intellectual abilities of the highest order. I often wondered how he came to like me so much, such a spoilt, thoughtless girl ; but he did ; and though we entered into no positive engagement, for our parents, owing to close kindred, would not hear of that, yet we both felt that our mutual future happiness was bound up in each other. Gervase was poor, as a younger son, and had no prospect of being able to marry, as his family had no livings in their gift, and no Church interest. But we were young, and lived in hope ; and at length we were allowed to correspond. I am quite sure that my letters were written in a clear, legible hand enough, and I should not have cared if all the world had read them, for I had no secrets, and they were not a bit like foolish love-letters, but only kind and friendly. I never was a demonstrative girl, and least of all in writing to Gervase. I have already alluded to the really shameful scrawl he wrote. Often used my dear mother to say : 'Well, Clara, have you got some hieroglyphics to pore over to-day ?' I really do believe the naughty fellow liked to tantalise me, and hear himself accused of bad penmanship ; for he always laughed at our complaints, and de-

clared that he wrote a beautiful hand, but that his sisters were stupid, and I was short-sighted !

Alas ! short-sighted indeed. That last letter which I found in my workbox had been written after an interval of many months, when a coolness had arisen between the families ; the old baronet was dead, the daughters of the house married, and my mother greatly disliked the heir and the proud lady his wife. Consequent on these circumstances, Gervase and I were somewhat estranged ; not in heart ; I know that now, when it is too late. On the evening of our rummagings, I read every word of that memorable letter ; every word was, to my quickened intelligence, clear as if printed in large type ; yet my mother said it might have been Egyptian characters for her !

Gervase had written ~~in~~ haste to tell me that he purposed joining an Indian mission immediately ; would I accompany him ? He was weary of waiting, and longed to be working amongst the heathen.

'You are well adapted to be a missionary's wife, and I think you will not disappoint me ; but if you dislike the prospect of a long residence in Indian climes, then let me entreat you *not* to reply to this ; and if I receive no letter from you, I shall consider that I am rejected ; if so, this is a farewell—it may be the last ; but in life or in death, you will still be the first and fairest on earth to me.'

Alas ! I had never read this, his last letter there it had lain all these dreary years in my old workbox, and now what chance (so called) brought it to light ? Years had passed away since then ; I had heard of Gervase Markham's departure for India, and I had accused him of fickleness and cold-heartedness. My own sisters had long been wives and mothers ; and I, the youngest, the spoilt, merry Clara, continued to live in a secluded home with my beloved mother, who declared that I was her best earthly comfort. For this, I was thankful. But then, poor Gervase, what must he have thought of me, on the supposition that I could so heartlessly reject him ! I wrote to his favourite sister, whose residence was in Florence, and begged her to give me some tidings of her brother, the missionary. She replied, that Gervase meant to return to England, as soon as some one could be found to take his place ; his health suffered greatly from the climate ; but he seemed otherwise contented, and devoted to his work. Now, if this were a fictitious narrative, I should end it by bringing Gervase Markham home again, and making all things comfortable, by placing him in a pleasant parsonage in a small parish, where there was not much to do. He should continue faithful to my memory ; and, when my oversight was explained, mutual explanations would of course ensue, leading to orange-blossoms and marriage joy-bells.

Nothing of the sort has happened. I know that Gervase is in Florence with his sister, because she wrote to say so, and that her brother sent his kind regards. How cold seem mere 'kind regards,' where warm affection was once given ! I live in hope that we may yet meet, though I doubt if he would recognise the rather stout, middle-aged lady, as the Clara whom he used to paint in such flattering colours. I long to tell him how much unhappiness arose from his illegible writing ; and I hope my sad story will be a warning to all who wish to avoid misunderstandings, and to excel in

caligraphy, which surely is as desirable an accomplishment as any other. I think that bad spelling and bad writing ought to go hand in hand. I mean that fatal letter to be placed on my breast in my coffin, and I hope that Gervase Markham may live to see it there.

### THE MONTH:

#### SCIENCE AND ARTS.

ART and science have adjourned over the long vacation; but for the 'scientists' who, meanwhile, wish to be busy, the meeting of the British Association at Bristol, to commence August 21, will offer a resource. Sir John Hawkshaw is to be president; hence it is thought there will be a good deal about civil engineering in his opening address.

A temporary revival of the arctic question has been occasioned by the departure of a small private expedition in the *Pandora*, commanded by Captain Allen Young. The principal object of this party will be the further exploration of King William Land, in the hope of discovering yet more traces of the long-lamented party that sailed with Sir John Franklin. Of the great expedition—the *Alert* and *Discovery*—we shall probably hear nothing until the *Vulorous* returns from Greenland.

While these explorers fight their way through the ice, the *Challenger* is pursuing her cruise in the South Sea, gathering further stores of knowledge preparatory to her return home in April of next year. Dr Wyville Thomson will then resume his professorial duties in the University of Edinburgh, and relieve Professor Huxley, who has so ably discharged the duties, and attracted so large a class during the present session.

And among the topics of talk are storms and shipwrecks. It is made clearer than ever, that if seamen will only use the lead and take soundings, instead of trusting to luck during a fog, they may save their ship from running on rocks or shoals. Eyes are of little or no use in the dense fogs that sometimes prevail in the vicinity of land, and the mariners must, so to speak, feel their way; and this can be done by means of the lead. The depth of the sea, and nature of the bottom, are now so well known around the coasts of all civilised countries, that the master of a ship who neglects to take soundings may be regarded as one who wilfully loses his ship. His neglect is now the more culpable, as Sir William Thomson has devised a method for taking what he calls 'flying soundings'—that is, without stopping the ship. The excuse that time would be lost is, therefore, no longer available.

It is remarkable that great floods have occurred in the two hemispheres. One of the largest river-valleys in France has been devastated by the rush of uprisen waters; and in Queensland, Australia, twenty-three inches of rain fell in twenty-four days, and the consequent flood was one of the deepest ever known in the colony. In one place the water rose twenty-nine feet, and covered the roof of the theatre. In another part

of the same colony, the wind blew with such vehemence as to overturn a railway train.

Another topic of talk is the discovery by the surveyors of Palestine of the city and cave of Adullam, in a broad low valley which formed one of the routes by which the Philistines broke in upon the fertile corn-lands of Judea. The name of the place is Ayd el Mich, sufficient, as is said, for identification with the biblical Adullam. 'If this be agreed upon,' says the Report of the exploration, 'fresh light will be thrown on the principal scenes of David's outlaw life.'

A notion prevails that famines occur in India because the country is over-populated. Major-general Shaw, who has passed more than half his life in India, states, in a communication to the Marquis of Salisbury, 'that this belief of India being over-peopled is not only erroneous, but the very reverse of the truth, and that she is actually suffering from a dearth of population and labour, and that an entirely wrong cause is being assigned for the prevailing high prices, and scarcity of food for the labouring-classes.' The remedies proposed are, migration from populous localities to the districts which, though rich in mineral products, and in capabilities for cultivation, have scarcely more than twelve inhabitants to the square mile; the restoration of decayed districts, and a general extension of cultivation.

Messrs Macklin and Moore, of Queen Victoria Street, London, undertake to transport gunpowder and other explosive substances in a way of their own invention, which prevents all danger. It is a simple way, and can be made use of in ships, barges, wagons, storehouses, or magazines. Each barrel of powder, before it leaves the mill, is placed inside a water-tight case made of wood, and lined with sheet-copper. These cases being properly closed, are placed in tanks, which fit them, so to speak, with a coat of water one inch thick on all sides. Thus, during the whole time of transport, the barrels, snugly shut up in the cases, are kept dry, and are at the same time surrounded by water, whereby, as it seems, explosion should be impossible. Tanks adapted either for land-carriage or water-carriage are provided, and for the storage of powder by retail dealers; and at mining-works, quarries, or railway stations, the tank is constructed of galvanised iron, and is connected with a constant water-supply.

A machine for making tin boxes is worth notice, on account of the ingenuity displayed in its construction. Tin boxes to contain biscuits are now as familiar objects as cups and saucers. For some time past the sides and ends have been shaped by machinery; but it was necessary to use solder to fix on the bottoms. The new machine makes the boxes without solder, and consequently effects a great saving of time. The tin plates, trimmed and pierced, are laid on the 'feeding-table' at one end of the machine: thence they pass under rollers which turn up the edges; fold in wires to form the top edge of the boxes; and between jaws or pressers which shape and secure the ends and sides, after which the bottoms are put on without solder, and the lids are fitted. Thus the work

goes on producing eight boxes per minute, with three boys to 'feed' and 'take off.' If, as we assume, the machine is adaptable to different shapes and sizes, the manufacture of metallic boxes is likely to increase.

With this may be mentioned a painting-machine, brought out at Liverpool, which will paint six hundred wooden laths, or more than the same length of hoop-iron, in an hour. The next step will be to produce a machine that will paint window-frames, doors, and house-fronts.

A life-raft, which presents some novelty of construction and adaptation, has been exhibited at a meeting of the Franklin Institute, Philadelphia. Two hollow cylinders, eight inches diameter, and ten or twelve feet long, are held in position parallel to each other by cross bars from three to four feet in length, and wire-netting is then stretched over the whole. Thus prepared, the raft is used as part of the rails or bulwark of a ship, and is consequently always in place at the side, ready to be dropped into the water, and does not occupy space wanted for other purposes, as when boats or rafts are stowed on the deck. An improved knife for druggists' use in the cutting of dried herbs or tobacco was also exhibited: in this the blade is so connected with the lever that in descending it is held parallel with the cutting-board, and at the same time has a horizontal movement which slides it through the substances to be cut, and thus facilitates the operation.

The Council of the Royal United Service Institution announce that they will grant a gold medal annually for the best essay on a military or naval subject, which may be sent in to them on or before November 1 in each year. The subject for the present year is: On the best type of war-vessels for the British Navy—(1) for combined action; (2) for single cruisers of great speed; (3) for coast defence.

We mentioned some months ago the pyrometer invented by Mr C. W. Siemens, F.R.S., which, placed within a furnace, will indicate the temperature, however high, by means of a galvanometer outside, with which it is connected. It is a philosophical instrument of rare excellence, quite worthy of the reputation of the inventor. In the *Transactions* of the Society of Telegraph Engineers, Mr Siemens has published an account of a preliminary experiment, which will, we think, be interesting to many readers. He was engaged by Her Majesty's government to superintend the laying of the under-sea cable between Malta and Alexandria. He had noticed that cables, when coiled in a ship, behave like damp hay-ricks, and generate heat, at times with destructive effect; and availing himself of the fact that electrical resistance increases with increase of temperature, he prepared coils of wire, inclosed them in tubes, and buried them in different parts of the great coil. The external layers of the coil remained cool, but the wires projecting from the tubes indicated a steady rise of temperature in the interior until it had reached 98 degrees. 'A few degrees of additional rise of temperature,' says Mr Siemens, 'must have destroyed the insulation of the cable; I therefore urged that cold water should be poured over it. This was not effected without strong opposition on the part of the incredulous; but when at last the water of the Thames, which was covered at the time with floating ice, was pumped over the cable, it flowed there-

from at the temperature of 78 degrees; thus proving the general correctness of the electrical indications previously observed.'

Mr Siemens continues: 'In consequence of this practical test, the government consented to the construction within the ship's hold of water-tight iron tanks, and also to the cable being submerged in water during its passage from the works to its destination; precautions which have ever since been adopted in laying submarine cables.'

In a paper on the best mining machinery, published by the Royal Cornwall Polytechnic Society, attention is called to the enormous waste of water always going on in the mining districts of Cornwall, and a suggestion is made that 'a scheme might be introduced whereby large areas might be cheaply constructed into reservoirs, and the drainage of the hills, water pumped from shafts, and waste from machines, would be collected, and let to parties employing machinery for crushing and dressing.' It is further shewn that on the open moors and downs of Cornwall, where breezes are always blowing, there is a great waste of wind. We are so accustomed to steam in this country, that we are apt to forget that the power of wind or of water is available for many purposes in which steam is employed. In Holland, as is well known, a prodigious amount of work is done by wind: some of the windmills are of a hundred horsepower; and similar mills might be employed with advantage in many mining operations in Cornwall.

The same Society have published a description of Andre's Hydraulic Mining Pump, which pump can be used for raising water from deep mines without the cumbrous appliances now in use. Water is stored in an accumulator at the surface: two pipes leading therefrom are fixed against the sides of the shaft, where they occupy no useful space, and by these the working-power is transmitted to the bottom of the mine. Provided sharp bends are avoided, these 'pressure-pipes' may be placed at any angle, and the direction may be changed as often as is required, which is a merit of great importance. The pressure is applied at the surface by means of plungers, which are worked by an ordinary steam-engine; and the whole arrangement may be regarded as an additional instance of the advantages arising from the use of water-power transmitted to long distances. We are informed that the loss of power by this method is very small, that a great saving of coal in the feeding of the steam-engine is effected, and that, as the pump is double, it utilises the whole power of a water-wheel.

The sand-blast, which we have mentioned more than once, grows more and more into use, as fresh applications of its capabilities are discovered. It can be used for all kinds of stone cutting and carving, for inscriptions, for engraving on glass, for cutting or cleaning metal. It comes in aid of the fine arts, and is the best thing that can be used for the prosy operation of cleaning down a dirty house-front. If a photographic picture on gelatine be laid on glass, a carefully regulated sand-blast will act upon the glass beneath the film more or less powerfully in proportion to the thickness of the film; and the half-tones, or gradations of light and shade, are thus produced on the glass. And in the matter of the house-front, the blast instantaneously removes soot or dust from all crevices and indentations, without in any way perceptibly

interfering with the sharpness of the architectural ornamentation.

Mr Lowthian Bell, F.R.S., has published in a separate form his *Notes of a Visit to Coal and Iron Mines and Iron Works in the United States*, which is well worth reading by all interested in industrial progress, and has especial value for those engaged, in any part of the world, in the working of iron. It is a small book filled with most important details.

An attempt has been made to introduce into this country the kind of dwelling-house known in India as a bungalow. For summer residence by the sea-side it offers advantages in which the ordinary dwelling-house is deficient; it is simple in shape, is usually not more than one story high, and is covered by a simple low-pitched roof, which may be prolonged to form a verandah. With this protection the inmates may pass most of their time in the open air, and thus have the fullest benefit of their sojourn by the sea. Visitors to the Isle of Thanet may now see a few bungalows, which, as we are informed, in a paper read before the Institute of British Architects, 'can be worked and kept clean with a very small amount of labour, as many contrivances to diminish servants' work have been introduced.' To keep out the damp, to which houses by the sea-side are so liable, two thin walls are built, with a space of about three inches between them. In the centre of this space a close screen of slate is fitted, and all the moisture blown through the outer wall is stopped by this screen, and trickles down to the bottom. The inner wall consequently remains quite dry, for the moisture does not blow through the slate, and the bungalow is habitable whatever the weather. Any one interested in the subject may see bungalows at Westgate and at Birchington. The builder is Mr John Taylor, whose ingenious building contrivances have long been known.

Two noteworthy books have been published. In *Queen Mary* the Poet-laureate shews that he has not lost his poetic fire, and that in combination therewith he holds a large amount of dramatic force. Apart from its merits in the purely intellectual point of view, it has powerful claims to recognition by reason of the effect it may have in warning readers against certain unwise religious tendencies which have of late years prevailed. The other book, the work of a philosopher, is *Insectivorous Plants*, by Charles Darwin, F.R.S., in which the peculiarities of the common sun-dew (*Drosera rotundifolia*) and plants of similar habit are described, and reasoned upon with rare skill, patience, and sagacity. The *Drosera* grows on barren swampy soil, and has but scanty roots, and would perhaps die out did it not take animal food. A short paragraph may suffice as a specimen of descriptiveness. 'A plant of *Drosera*,' says Mr Darwin, 'with the edges of its leaves curled inwards, so as to form a temporary stomach, with the glands of the closely inflected tentacles pouring forth their acid secretion, which dissolves animal matter, afterwards to be absorbed, may be said to feed like an animal. But, differently from an animal, it drinks by means of its roots; and it must drink largely, so as to retain many drops of viscid fluid round the glands, sometimes as many as two hundred and sixty, exposed during the whole day to a glaring sun.'

### FLYING HOURS.

From morn's first flush to the twilight gray,  
Ever they hold on their silent way;  
Through the flower-lit dawn of the dewy spring  
Onward they pass with undrooping wing,  
And summer leafage, and autumn showers,  
Behold the flight of the changing Hours:  
Swift birds of passage on pinions free  
Crossing Life's restless sea.

The shade on the dial journeys round,  
The steeples utter their warning sound,  
And still with the march of their viewless feet,  
Bearing to mortals their burden meet,  
Of cloud or of sunshine, mirth or woe,  
In their long processions come and go  
The Hours, like a hastening pilgrim band  
Bound for an unknown land.

To the worn and weary hearts of some,  
With a sad and lingering step they come,  
And the mournful print of their track is left  
In perished hopes and affections reft;  
And some with a gentle footfall pass,  
Like mild spring rain upon budding grass,  
Joy-lumin'd Hours all sweet and rife  
With the morning bloom of life.

Oh, little we reck, as one by one  
Smiling they rise, and are straightway gone!  
Softly as melts the dew-drop crown  
From the crest of the foamy thistle-down;  
But when with their freight of love and light  
Far away from our beaming sight,  
They have floated down Time's rushing stream,  
How bright, how fair they seem!

Oh, watch we now in the day of grace,  
Lest, when we have run our earthly race,  
When our souls in the shadow of death shall lie  
On the awful verge of eternity,  
Life's Hours should stand, an accusing band,  
With the record dread in each phantom hand,  
Of wasted talents, brave vows unkept,  
And daily sin unwept!

On Saturday, August 7, 1875, will be commenced, in this JOURNAL, a NOVEL, entitled

### THE FLAG OF DISTRESS.

By Captain MAYNE REID.

To be continued weekly till finished.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

## THE FLAG OF DISTRESS:

A STORY OF THE SOUTH SEA.

BY CAPTAIN MAYNE REID.

CHAPTER I.—A CHASE.

IN mid-ocean—the Pacific. Two ships are within sight of one another, less than a league apart. Both are sailing before the wind, running dead down it with full canvas spread. Not side by side, but one in the wake of the other.

Is it a chase? To all appearance it is; a probability strengthened by the relative size and character of the ships. One is a barque, polacca-masted, her masts raking back with the acute shark's-fin set supposed to be characteristic of the pirate. The other is a ship, square-rigged and full-sized; a row of real, not painted ports, with a gun grinning out of each, proclaiming her a man-of-war. She is one—a frigate, as any seaman would say, after giving her a glance. And any landsman might name her nationality. The flag at her peak is one known all over the world. It is the 'Union-jack' of England.

If it be a chase, she is the pursuer. Her colours might be accepted as surety of this, without regard to the relative position of the vessels; which shew the frigate astern, the polacca leading.

The latter also carries a flag; of nationality not so easily determined. Still is it the ensign of a naval power, though one of little note. The five-pointed white star, solitary in a blue field, proclaims it the standard of Chili.

Why should an English frigate be chasing a Chilean barque? There is no war between Great Britain and Chili, the most prosperous of the South American republics. Instead, peace-treaties, with relations of the most amicable kind. Were the polacca flying a flag of blood-red, or black, with death's-head and cross-bones, the chase would be intelligible. But the bit of hunting at her mast-head shews nothing on its field either of menace or defiance. On the contrary, it appeals to pity,

and asks for aid. For it is an ensign reversed—in short, a *signal of distress*.

And yet the ship shewing it is scudding before a stiff breeze, with all sail set, stays taut, not a rope out of place! Strange this. Just the thought of every one aboard the man-of-war, from the captain commanding to the latest joined 'lubber of a landsman'; a thought that has been in their minds ever since the chase commenced.

For it is a chase: that is, the frigate has sighted a sail, and stood towards it. This without changing course; as, when first espied, the stranger, like herself, was running before the wind. If slowly, the frigate has been gradually forging nearer the pursued vessel; till at length the telescope tells her to be a barque—revealing also the ensign reversed.

Nothing strange in this, of itself; unfortunately, a sight too common at sea. But that a vessel displaying signals of distress should be carrying all sail, and running away, or attempting to run away, from another making to relieve her—above all, from a ship bearing the British flag—this is strange. And just thus has the polacca been acting—still is; sailing on down the wind, without slackening halyards, or lessening her spread of canvas by a single inch. Certainly her behaviour is unaccountable. More than strange—it is mysterious.

To this conclusion have they come on board the war-ship. And, naturally enough, for there is that which has imbued their thoughts with a tinge of superstition. In addition to what they see, they have something heard. Within the week they have spoken two vessels, both of which reported this same barque, or one answering her description: 'Polacca-masted, all sail set, ensign reversed.'

A British brig, which the frigate's boat had boarded, said : that such a craft had run across her bows so close, they could have thrown a rope to her ; that at first no one was seen aboard, but on being hailed, two men made appearance, both springing up to the main-shrouds ; thence answering the hail in a language altogether unintelligible, and with hoarse croaking voices that resembled the barking of muzzled mastiffs !

It was late twilight, almost night, when this occurred ; but the brig's people could make out the figures of the men, as they clung on to the ratlines. And what surprised them equally with the odd speech, was, that both appeared to be clothed in skin-dresses, covering their bodies from head to foot ! Seeing the signal of distress, the brig would have sent her boat aboard ; but the barque gave no chance for this, keeping on without slackening sail, or shewing any other sign of a wish to communicate !

Standing by itself, the tale of the brig's crew might have been taken for a sailor's yarn ; and as they admitted it to be 'almost night,' the obscurity would account for the skin-clothing. But, coupled with the report of another vessel, which the frigate had since spoken—a whaler—it seemed to receive full corroboration. The words sent through the whaler's trumpet were : 'Barque sighted, latitude 10.22 S., longitude 95 W. Polacca-masted. All sail set. Ensign reversed. Chilian. Men seen on board covered with red hair, supposed skin-dresses. Tried to come up, but could not. Barque a fast sailer—went away down wind.'

Already in receipt of such intelligence, it is no wonder that the frigate's crew feel something more than mere surprise at sight of a vessel corresponding to that about which these strange tales have been told. For they are now near enough the barque to see that she answers the description given : 'Polacca-masted—all sail set—ensign reversed—Chilian.'

And her behaviour is as reported : sailing away from those who wish to answer her appealing signal, to all appearance endeavouring to shun them ! Only now has the chase in reality commenced. Hitherto the frigate was but keeping her own course. But the signal of distress, just sighted through the telescope, has drawn her on ; and with canvas crowded she steers straight for the polacca. The latter is unquestionably a fast sailer ; but although too swift for the whaler, she is not a match for the man-of-war. Still she is no tub, and the chase is likely to be a long one.

As it continues, and the distance does not appear very much, or very rapidly, diminishing, the frigate's crew begin to doubt whether the strange craft will ever be overtaken. On the fore-deck the tars stand in groups, mingled with marines, their eyes bent upon the retreating barque, pronouncing their comments in muttered tones, many of the men with brows o'ercast ; for a fancy has sprung up around the fore-castle, that the chased ship is no ship at all, but a phantom ! This fancy is gradually growing into a belief ; faster as they draw nearer, and with naked eye note her correspondence with the reports of the spoken vessels.

They have not yet seen the skin-clad men—if men they be. More like, imagine some, they will prove to be spectres !

While on the quarter-deck there is no such superstitious fancy, a feeling almost as intense agitates the minds of those there assembled. The captain, surrounded by his officers, stands glass in hand gazing at the sail ahead. The frigate, though a fine vessel, is not one of the fastest sailers ; else she might long ago have lapped upon the polacca. Still has she been gradually gaining, and is now less than a league astern. But the breeze has been also gradually declining, which is against her ; and for the last half-hour she has barely preserved her distance from the barque.

To compensate for this, she runs out studding-sails on all her yards, even to the royals ; and again makes an effort to bring the chase to a termination. But again is there disappointment.

'To no purpose, now,' says her commander, as he sees his last sail set. Then adding, as he casts a glance at the sky, sternwards : 'The wind's going down. In ten minutes more we'll be becalmed.'

Those around need not to be told this. The youngest reefer there, looking at sky and sea, can forecast the calm.

In five minutes after, the frigate's sails are flapping against the masts, and her flag hangs half-folded.

In five more, the sails only shew motion by an occasional clout ; while the bunting droops dead downward.

Within the ten, as her captain predicted, the huge war-ship, despite her extended canvas, lies motionless on the sea.

#### CHAPTER II.—A CALL FOR BOARDERS.

The frigate is becalmed—what of the barque ? Has she been similarly checked in her course ? The question is asked by all on board the war-ship, each seeking the answer for himself. For all are earnestly gazing at the strange sail, regardless of their own condition.

Forward, the superstitious thought has become intensified into something like fear. A calm coming on so suddenly, just when they had hopes of soon overhauling the chased vessel—what could that mean ? Old sailors shake their heads, refusing to make answer ; while young ones, less cautious of speech, boldly pronounce the polacca a spectre ! The legends of the Phantom Ship and Flying Dutchman are in their thoughts, and on their lips, as they stand straining their eyes after the still receding vessel ; for beyond doubt does she sail on with waves rippling around her !

'As I told ye, mates,' remarks an old tar, 'we'd never catch up with that craft—not if we stood after her till doomsday. And doomsday it might be for us, if we did.'

'I hope she'll keep on, and leave us a good spell behind,' rejoins a second. 'It was a foolish thing followin' her ; and, for my part, I'll be glad if we never do catch up with her.'

'You need have no fear about that,' says the first speaker. 'Just look ! She's making way yet ! I believe she can sail as well without wind as with it.'

Scarcely are the words spoken, when, as if to contradict them, the sails of the chased vessel commence clouting against her masts ; while her flag falls folded, and is no longer distinguishable as a signal of distress, or aught else. The breeze that failed the frigate, is now also dead around the

barque, which, in like manner, has been caught in the calm.

'What do you make her out, Mr Black?' asks the frigate's captain of his first, as the two stand looking through their levelled glasses.

'Not anything, sir,' replies the lieutenant; 'except that she should be Chilian from her colours. I can't see a soul aboard of her. Ah, yonder! Something shews over the taffrail! Looks like a man's head? It's ducked suddenly.'

A short silence succeeds, the commanding officer busied with his binocular, endeavouring to catch sight of the thing seen by his subordinate. It does not shew again.

'Odd,' says the captain, resuming speech; 'a ship running up signals of distress, at the same time refusing to be relieved! Very odd! Isn't it, gentlemen?' he asks, addressing himself to the group of officers now gathered around.

Unanimous assent to his interrogatory.

'There must be something amiss,' he continues. 'Can any of you think what it is?'

To this there is a negative response. Lieutenants and midshipmen seem all as puzzled as himself, mystified by the strange barque, and more by her strange behaviour.

There are two who have thoughts different from the rest—the third lieutenant, and one of the midshipmen. Less thoughts, than imaginings; and these so vague, that neither communicates them to the captain, nor to one another. And whatever their fancies, they do not appear pleasant ones, since on the faces of both is an expression of something like anxiety. Slight, and scarcely observable, it is not noticed by their comrades standing around. It seems to deepen, while they continue to gaze at the becalmed barque, as though due to something seen there. Still they remain silent, keeping the dark thought, if such it be, to themselves.

'Well, gentlemen,' says the commanding officer to his assembled subordinates, 'I must say this is singular. In all my experience at sea, I don't remember anything like it. What trick the Chilian barque—if she be Chilian—is up to, I can't guess; not for the life of me. It cannot be a case of piracy. The craft has no guns; and if she had, she appears without men to handle them. It's a riddle all round; to get the reading of it, we'll have to send a boat to her.'

'I don't think we'll get a very willing crew, sir,' says the first lieutenant suggestively. 'Forward, they're quite superstitious about the character of the chase. Some of them fancy her the Flying Dutchman. When the boatswain pipes for boarders, they'll very likely feel as if his whistle were a signal for them to walk the plank.'

The remark causes the captain to smile, as the other officers; though two of the latter abstain from this exhibition of merriment. These are the third lieutenant and midshipman—already mentioned—on both of whose brows the cloud still sits, seeming darker than ever.

'Isn't it strange,' continues the commander, musingly, 'that your genuine British tar, who will board an enemy's ship, crawling across the muzzle of a shotted gun—who has no fear of death in human shape—will act like a scared child when it threatens him in the guise of his satanic majesty? I have no doubt, as you say, Mr Black, that those fellows by the fore-castle are a bit shy about boarding this strange vessel. But let me shew you how to

send their shyness adrift. I shall do that with a single word!'

The captain steps forward, his subordinates following him. When within speaking distance of the fore-deck, he stops, and makes sign that he has something to say. The tars are all attention.

'My lads!' he exclaims, 'you see that barque we've been chasing; and at her mast-head a flag reversed—which you know to be a signal of distress? That is a call never to be disregarded by an English ship, much less an English man-of-war. Lieutenant! order a boat to be lowered, and let the boatswain pipe for boarders. Only volunteers will be taken. Those who wish to go, will muster on the main-deck.'

A loud 'hurrah!' responds to the appeal; and, while its echoes are still resounding through the ship, the whole crew seems crowding towards the main-deck. Scores of volunteers present themselves, enough to man every boat aboard.

'Now, gentlemen,' says the captain, turning to his officers with a proud expression on his countenance, 'there's the British sailor for you. I've said he fears not man. And, when humanity makes call, as you see, neither is he frightened at a fancied ghost!'

A second cheer succeeds the speech, mingled with good-humoured remarks, though not any loud laughter. The sailors simply acknowledge the compliment their commanding officer has paid them, at the same time feeling that the moment is too solemn for merriment; for their instinct of humanity is yet under control of the weird feeling. As the captain turns aft to the quarter, many of them fall away toward the fore-deck, till the group of volunteers for boarding has got greatly diminished. Still are there enough to man the largest boat in the ship.

'What boat is it to be, sir?'

This question is asked by the first lieutenant, as he follows the captain aft.

'The cutter,' answers his superior, adding: 'I think, Mr Black, there's no necessity for sending any other. The cutter's crew will be sufficient. As to any hostility from those on board the stranger, that is absurd. We could blow them out of the water with a single broadside.'

'Who's to command the cutter, sir?'

The captain reflects, with a look sent inquiringly around. His eye falls upon the third lieutenant, who stands near, seemingly courting the glance. It is short and decisive. The captain knows his third officer to be a thorough seaman; though young, capable of any duty, however delicate or dangerous. Without further hesitation, he assigns him to the command of the boarders.

The young officer enters upon the service with alacrity—something more than the mere obedience due to discipline. He hastens to the ship's side to superintend the lowering of the boat. He does not stand at rest, but is seen to help and hurry it, with a look of anxious impatience in his eye, and the cloud still observable on his brow. While thus occupied, he is accosted by another officer, one yet younger than himself—the midshipman already mentioned.

'Can I go with you?' the latter asks.

'Certainly, my dear fellow,' responds the lieutenant in friendly familiar tone. 'I shall be only too pleased to have you. But you must get the captain's consent.'

The young officer glides aft, sees the frigate's commander upon the quarter-deck, and saluting, says: 'Captain, may I go with the cutter?'

'Well, yes,' responds the chief; 'I have no objection.' Then, after taking a survey of the youngster, he adds: 'Why do you want it?'

The youth blushes, without replying. There is a cast upon his countenance that strikes the questioner, somewhat puzzling him. But there is no time either for further inquiry or reflection. The cutter is already lowered, and rests upon the water. Her crew is crowding into her; and she will soon be shoved off from the ship.

'You can go, lad,' assents the captain. 'Report yourself to the third lieutenant, and tell him I've given you leave. You're young, and, like all youngsters, ambitious of gaining glory. Well, in this affair you won't have much chance, I take it. It's simply boarding a ship in distress, where you'll be more likely to be a spectator of scenes of suffering. However, that will be a lesson for you; and therefore you may go.'

Thus authorised, the young reefer glides away from the quarter-deck, drops down into the boat, and takes his seat alongside the lieutenant, already there.

The two ships still lie becalmed, in the same relative position to one another, having changed from it scarce a cable's length. And stem to stern, just as the last breath of the breeze, blown gently against their sails, forsook them.

On both, the canvas is still spread, though not bellied. It hangs limp and loose, giving an occasional flap, so feeble as to shew that it proceeds, not from any stir in the air, but the mere balancing motion of the vessels; for there is now not enough breeze blowing to flout the long feathers in the tail of the Tropic bird, seen soaring aloft.

Both ships are motionless; their forms reflected in the water, so that each has its counterpart keel to keel.

Between them, the sea is smooth as a mirror—that tranquil calm which has given to the Pacific its distinctive appellation. It is now to be disturbed, furrowed by the bow of the cutter, with her stroke of ten oars, five on each side. Almost as soon as down from the davits, her crew seated on the thwarts, and her coxswain at the tiller, the lieutenant gives the command to 'shove off.' Parting from the frigate's beam, the boat is steered straight for the becalmed barque.

On board the man-of-war, all stand watching her, their eyes at intervals directed towards the strange vessel. From the frigate's forward-deck, the men have an unobstructed view, especially those clustering around the head. Still there is nearly a league between, and with the naked eye this hinders minute observation. They can but see the white-spread sails, and the black hull underneath them. With a glass, the flag, now fallen, is just distinguishable from the mast along which it clings closely. They can perceive that its colour is crimson above, with blue and white underneath—the reversed order of the Chilian ensign. Its single star is no longer visible, nor aught of its heraldry, that spoke so appealingly. But if the sight fails to furnish them with details, these are amply supplied by their excited imaginations. Some of them see men aboard the barque—scores, hundreds! After all, she may be a pirate, and the upside-down ensign a decoy. On a tack, she may be a

swifter sailer than she has shewn herself before the wind; and, knowing this, has been but playing with the frigate. If so, God help the cutter's crew!

Besides these conjectures of the common kind, there are those on the frigate's fore-deck who, in truth, fancy the polacca a spectre. As they continue gazing, now at the boat, now at the barque, they expect every moment to see the one sink beneath the sea; and the other sail off, or melt into invisible air.

On the quarter, speculation is equally rife, though running in a different channel. There the captain still stands surrounded by his officers, each with glass to his eye, levelled upon the strange craft. But they see nought to give them a clue to her character; only the loose spread sails, and the fabled flag of distress. They continue gazing till the cutter is close to the barque's beam. Nor yet can they observe any head above the bulwarks, or face peering through the shrouds. The fancy of the fore-castle has crept aft among the officers. They too begin to feel something of superstitious fear—an awe of the uncanny!

#### CHAPTER III.—THE CUTTER'S CREW.

Manned by ten stout tars, with as many oars propelling her, the cutter cleaves the water like a knife. The lieutenant, seated in the stern-sheets, with the mid by his side, directs the movements of the boat; while the glances of both are kept constantly upon the barque. In their eyes is an earnest expression—quite different from that of ordinary interrogation.

The men may not observe it; if they do, it is without comprehension of its meaning. They can but think of it as resembling their own, and proceeding from a like cause. For although with backs turned towards the barque, they cast occasional glances over their shoulders, in which curiosity is commingled with apprehension.

Despite their natural courage, strengthened by the late appeal to their humanity, the awe is again upon them. Insidiously returning as they took their seats in the boat, it increases as they row farther from the ship, and nearer to the strange vessel. Less than half an hour has elapsed, and they are within a cable's length of the latter.

'Hold, now!' commands the lieutenant.

The oar-stroke is instantly suspended, and the blades held aloft. The boat gradually loses way, and at length rests stationary on the tranquil water.

All eyes are bent upon the barque; glances go searchingly along her bulwarks, from poop to prow. No preparations to receive them! No one appears on deck—not a head seen over the rail!

'Barque, ahoy!' hails the lieutenant.

'Barque, ahoy!' is heard in fainter tone. It is no answer; only the echo of the officer's voice, coming back from the hollow timbers of the becalmed vessel. There is again silence, more profound than ever; for the sailors in the boat have ceased talking, their awe, now intense, holding them speechless.

'Barque, ahoy!' again shouts the lieutenant, louder than before, but with like result. As before, he is only answered by echo. There is either nobody aboard, or no one who thinks it worth while to make rejoinder. The first supposition seems absurd, looking at the sail; the second, equally so, regarding the flag at the main royal mast-head, and taking into account its character.

A third hail from the officer, this time vociferated in loudest voice, with the interrogatory added: 'Any one aboard?'

To the question no reply, any more than to the hail. Silence continues—stillness intense, awe-inspiring. They in the boat begin to doubt the evidence of their senses. Is there a barque before their eyes? Or is it all an illusion? How can a vessel be under sail—full sail—without sailors? And if any, why do they not shew at her side? Why have they not answered the hail thrice shouted; the last time loud enough to be heard within her hold? It should have awakened her crew even if asleep in the fore-castle!

'Give way again!' cries the lieutenant. 'Bring up on the starboard side, coxswain; under the fore-chains.'

The oars are dipped, and the cutter moves on. But scarce is she in motion, when once more the officer commands: 'Hold!'

With his voice mingle others, coming from the barque. Her people seem at length to have become aroused from their sleep, or stupor. A noise is heard upon her deck, as of a scuffle, accompanied by cries of strange intonation. Soon two heads, apparently human, shew above the bulwarks; two faces flesh-coloured, and thinly covered with hair. Then the whole bodies appear, also human like, save that they are hairy all over—hair of a foxy red. They swarm up the shrouds; and clutching the ratlines, shake them with quick violent jerks; at the same time uttering what appears angry speech, in an unknown tongue, and harsh voice, as if chiding off the intruders. Only a short way up the shrouds, just as far, as they could spring from the deck, and only staying a little while there. Then they drop down again, disappearing as abruptly as they had shewn themselves.

The lieutenant's command was a word thrown away. Without it the men would have discontinued their stroke. They have done so, and sit with bated breath, eyes strained, ears listening, and lips mute, as if all had been suddenly and simultaneously struck dumb. Silence throughout the boat—silence aboard the barque—silence everywhere; the only sound heard being the 'drip-drop' of the water, as it falls from the feathered oar-blades.

For a time the cutter's crew remain speechless, not one essaying to speak a word. They are so, less from surprise, than sheer stark terror. It is depicted on their faces, and no wonder it should. What they have just seen is sufficient to terrify the stoutest hearts—even those of tried tars, as all of them are. A ship manned by hairy men—a crew of veritable Orsons! Certainly enough to startle the most phlegmatic mariner, and make him tremble as he tugs at the oar. But they have ceased tugging at their oars, and hold them, blades suspended, along with their breath. One alone musters sufficient courage to mutter out: 'Gracious goodness! shipmates, what can it mean?'

He receives no answer, though the silence comes to an end. It is broken by the voice of the lieutenant, and also that of the junior officer. They do not speak simultaneously, but one after the other. The superstitious fear pervading the minds of the men does not extend to them. They too have their fears, but of a different kind, and from a different cause. As yet, neither has communicated

to the other what he himself has been thinking; the thoughts of both being hitherto vague, but every moment becoming more defined. And the appearance of the red men upon the ratlines—strange to the sailors—seems to have made things more intelligible to them. Judging by the expression upon their faces, they comprehend what has puzzled their companions. And with a sense of anxiety more than fear, more of doubt than dismay.

The lieutenant speaks first, shouting in command: 'Give way! Quick! Pull in! Head on for the fore-chains!'

He acts in an excited manner, appearing nervously impatient. As if mechanically, the midshipman repeats the order, imitating the mien of his superior. The men execute it, but slowly, and with evident reluctance. They know their officers to be daring fellows, both. But now they deem them rash, even to recklessness. For they cannot comprehend the motives urging them to action. Still they obey; and the prow of the boat strikes the barque abeam.

'Grapple on!' sings out the senior officer, soon as touching. A boat-hook takes grip in the chains; and the cutter, swinging round, lies at rest alongside. The lieutenant is already on his feet, as also the mid. Ordering only the coxswain to follow, they spring up to the chains, lay hold, and lift themselves aloft.

Obedient to orders, the men remain in the boat; still keeping their seat on the thwarts, in wonder at the bold bearing of their officers, at the same time silently admiring it.

Balancing themselves on the rail, the latter look down upon the deck of the polacca. Their glances sweep it forward, aft, and amid-ships; ranging from stem to stern, and back again. Nothing seen there to explain the strangeness of things, nothing heard. No sailor on deck, nor officer on the quarter! Only the two strange beings that had shewn themselves on the shrouds. These are still visible, one of them standing by the main-mast, the other crouching near the caboose. Both again give out their jabbering speech, accompanying it with gestures of menace. Disregarding this, the lieutenant leaps down upon the deck, and makes towards them; the mid and coxswain keeping close after.

At their approach, the hirsute monsters retreat, not scared-like, but with a show of defiance, as if disposed to contest possession of the place. They give back, however, bit by bit, till at length, ceasing to dispute, they shuffle towards the quarter, and then on to the poop. Neither of the two officers pays any attention to their demonstrations; and the movement aft is not made for them. Both lieutenant and midshipman seem excited by other thoughts, some stronger impulse urging them on. Alone is the coxswain mystified by the hairy men, and not a little alarmed; but without speaking, he follows his superiors.

They continue on toward the quarter-deck, making for the cabin door. Having boarded the barque by the fore-chains, they must pass the caboose going aft. Its sliding panel is open, and when opposite, all three come to a stand. They are brought to it by a faint cry issuing out of the cook's quarters. Looking in, they behold a spectacle sufficiently singular to detain them. It is more than singular—it is startling. On the bench in front of the galley fire, which shews as if long extinguished, sits a man, bolt upright, his back

against the bulkhead. Is it a man, or only the dead body of one? Certainly it is a human figure; or, speaking more precisely, a human skeleton with the skin still on; this as black as the coal-cinders in the grate in front of it.

It is a man, a negro, and still living; for at sight of them he betrays motion, and makes an attempt to speak.

Only the coxswain stays to listen, or hear what he has to say. The others hurry on aft, making direct for the door of the cabin; which, between decks, is approached by a stairway. Reaching this they rush down, and stand before the door, which they find shut. Only closed, not locked. It yields to the turning of the handle, and opening, gives them admission. They enter hastily, one after the other, without ceremony or announcement. Once inside, they as quickly come to a stop, both looking aghast. The spectacle in the caboose was nought to what is now before their eyes. That was but startling, this is appalling.

It is the main-cabin they have entered, not a large one, for the polacca has not been intended to carry passengers. Still is it snug and roomy enough for a table six feet by four. Such a one stands in its centre, its legs fixed in the floor, with four chairs around it, similarly stanchioned.

On the table there are decanters and dishes, alongside glasses and plates. It is a dessert service, and on the dishes are fruits, cakes, and sweetmeats, with fragments of these upon the plates. The decanters contain wines of different sorts, and there are appearances as of wine having been in the glasses.

There are four sets, corresponding to the four chairs; and, to all appearance, this number of guests have been seated at the table. But two of the chairs are empty, as if their occupants had retired to an inner state-room. It is the side-seats that are unoccupied, and a fan lying on one, with a scarf over the back of that opposite, proclaim their last occupants to have been ladies.

Two guests are still at the table, one at its head, the other at its foot, facing each other. And such guests! Both are men, though, unlike him in the caboose, they are white. But, like him, they too appear in the extreme of emaciation: jaws with the skin drawn tightly over them, cheek-bones prominent, chins protruding, eyes sunken in their sockets.

Not dead either; for their eyes, glancing and glaring, still shew life. But there is little other evidence of it. Sitting stiff in the chairs, rigidly erect, they make no attempt to stir, no motion of either body or limbs; which seem as if from both all strength had departed, their famished figures denoting the last stages of starvation! And this in front of a table furnished with choice wines, fruits, and other comestibles; in short, loaded with delicacies! What can it all mean?

Not this question, but a cry comes from the lips of the two officers, as they stand regarding the strange tableau. Only for an instant. Then the lieutenant, rushing back up the stair, and on to the side, calls out: 'To the ship, and bring the doctor! Quick, quick!'

The boat's crew, obedient, row off with alacrity. They are but too glad to get away from the suspected spot. As they strain at their oars, with faces turned toward the barque, and eyes wonderingly bent upon her, they see nought to give

them a clue to the conduct of their officers, or in any way elucidate the series of mysteries, now prolonged to a chain. One imbued with a strong belief in the supernatural, shakes his head, saying: 'Shipmates, we may never see that lieutenant again, nor the young reefer, nor the old cox'n—never!'

During all this time those on board the man-of-war have stood regarding the barque—at the same time watching the movements of the boat. Only they who have glasses can see what is passing with any distinctness. For the day is not a bright one, a haze over the sea hindering observation. It has arisen since the fall of the wind, perhaps caused by the calm; and though but a mere film, at such far distance it interferes with the view through the telescopes. Those using them can just tell that the cutter has closed in upon the strange vessel, and is lying along under the fore-mast shrouds, while some of her crew appear to have swarmed up the chains. This cannot be told for certain. The haze around the barque is more dense than elsewhere, as if steam were passing off from her sides; and through this objects shew only confusedly.

While the frigate's people are straining their eyes to make out the movements of the cutter, an officer, of sharper sight than the rest, cries: 'See! the boat is coming back.'

All perceive this, and with some surprise. It is not ten minutes since the boat grappled on. Why returning so soon?

While they are conjecturing as to the cause, the same officer again observes something that has escaped the others. There are but *eight* oars, instead of ten—the regulation strength of the cutter—and ten men where before there were thirteen. Three of the boat's crew have remained behind.

This causes neither alarm nor uneasiness to the frigate's officers. They take it that the three have gone aboard the barque, and for some reason, whatever it be, elected to stay there. They know the third lieutenant to be not only brave, but a man of quick decision, and prompt to act. He has boarded the distressed vessel, discovered the cause of distress, and sent the cutter back to bring whatever may be needed for her relief. Thus reasons the quarter-deck.

It is different on the fore, where apprehensions are rife about their missing shipmates; fears that some misfortune has befallen them. True, no shots have been heard, nor flashes seen. Still they could have been killed without firearms; and savages might use other and less noisy weapons. The tale of the skin-clad crew gives colour to this supposition. But then the crew of the cutter went armed—in addition to their cutlasses, being provided with pikes and boarding-pistols. Had they been attacked, they would not have retreated without discharging the last—less likely leaving three of their number behind. But there have been no signs of strife, or struggle, seen! All the more mystery; and pondering upon it, the frigate's crew are but strengthened in their superstitious faith.

Meanwhile, the cutter is making way across the stretch of calm sea that separates the two ships; and although with reduced strength of rowers, cleaves the water quickly. The movements of

the men indicate excitement. They pull as if rowing in a regatta.

Soon they are near enough to be individually recognised; when it is seen that neither of the two officers is in the boat; nor the coxswain, one of the oarsmen having taken his place at the tiller.

As the boat draws nearer, and the faces of the two men seated in the stern-sheets can be distinguished, there is observed upon them an expression which none can interpret. No one tries. All stand silently waiting till the cutter comes alongside, and sweeping past the bows, brings up on the frigate's starboard beam, under the main-chains.

The officers move forward along the gangway, and stand looking over the bulwarks; while the men come crowding aft as far as permitted. The curiosity of all receives a check—an abrupt disappointment. There is no news from the barque, save the meagre scrap contained in the lieutenant's order: 'Bring the doctor.'

Beyond this the cutter's crew only know that they have seen the hairy men. Seen and heard them, though without understanding a word of what they said. Two had sprung upon the shrouds, and shouted at the cutter's people, as if scolding them off!

The tale spreads through the frigate, fore and aft, quick as a train of powder ignited. It is everywhere talked of, and commented on. On the quarter, it is deemed strange enough; while forward, it further intensifies the belief in something supernatural.

The tars give credulous ear to their comrade, again repeating what he said in the boat, and in the self-same words: 'Shipmates, we may never see that lieutenant again, nor the young reefer, nor the old cox'n—never!'

The boding speech seems a prophecy already realised. Scarce has it passed the sailor's lips, when a cry rings through the ship that startles all aboard, thrilling them more intensely than ever.

While the men have been commenting upon the message brought back from the barque, and the officers are taking steps to hasten its execution—the doctor getting out his instruments, with such medicines as the occasion seems to call for—the strange vessel has been for a time unthought of.

The cry just raised recalls her, causing them to rush towards the frigate's side, and once more bend their eyes on the barque.

No, not on her; only in the direction where she was last seen. For, to their astonishment, the *polacca* has disappeared!

#### NATURAL HISTORY AND SPORT OF SOUTH-EASTERN AFRICA.

For those to whom the very name of Game acts as a war-cry, who love danger for daring's sake, and who prefer the skin of some wild beast spread under the open canopy of heaven to the softest couch modern luxuriousness can provide, the Honourable W. H. Drummond's book, entitled *The Game and Natural History of South-eastern Africa*, must prove an acceptable boon. The subject of the natural history of Africa and its game is one full of interest, and a few facts in connection with it we will now lay before our readers. The ground chosen by Mr Drummond as his hunting-field

extended over a wide area from 26° to 29° S. lat.; and he gives us the experience of five years, during which he rarely slept under a roof.

But even in these wild districts, still probably the finest game-country in the world, we find savage beasts like savage races diminishing at the approach of the white man. As our colonies spread, and our colonists penetrate farther and farther inland, the wild animals retreat, or become exterminated. Nor does this cause alone operate to diminish their numbers. The greed of the hunters brings its own punishment, as in the instances of the eland and the elephant. In the former case, the hide being very valuable, and the flesh extremely good eating, the hunters will occasionally kill a whole herd, bull and calf, without a thought for the future. While, as regards the elephant, the improvident greed for present wealth from the sale of ivory, becomes a much more serious affair, involving as it does the ultimate, indeed speedy, extirpation of this interesting and valuable animal. While sympathising with our author, and lamenting the wanton destruction of the eland and elephant, let us stand in imagination on the banks of that Unkomati River, in the far interior of Eastern Africa, where our traveller encamped in the summer of 1870; and with him let us watch the curious habits and customs of the game, which always come at early dawn to the nearest river or water-hole to drink, and perhaps to bathe. Few positions could well be more full of thrilling interest than some that Mr Drummond took, when, hid in the thick branches of a great cabbage-tree, he watched through long nights the various herds of wild animals as they congregated round some pool—rhinoceroses, buffalo, hyenas, antelopes, all, almost within touching distance, following their time-honoured customs, unconscious of the observant eye of man; while in the fissure of a neighbouring mountain some great owl would entertain himself, and possibly his wife and family, by imitating the cry of the leopard. Many an interesting point in the natural history of these animals was made plain to the observer during these vigils—their relations to each other in the matter of fear or confidence, courage or cowardice. A herd of Koodoo (*Antelope strepsiceros*) stepping silently down to the water with ears intent to catch the faintest sound of danger, would drink, and then as silently retire; while the larger game would often seem unconscious of each other's presence—a troop of lions sometimes walking past some old rhinoceros bull with its mouth buried in the pool, and laying themselves down, lap the water within a few yards of me.' Or 'some grumbling, ill-tempered *teptyaice*, or two-horned rhinoceros (*R. bicornis*), would come in sight, ploughing up the ground in long furrows, as it pawed it with its foot after the manner of savage bulls, but hardly making the antelopes stir, as he walked past them to the centre of the pool.' But meanwhile great herds of gnu and zebra, and sometimes eland, would stand almost motionless, too thirsty to graze, yet not daring to approach the water, till thirst conquered prudence.

The eager observing of wild animated nature under a starlit sky must have had a wonderful fascination; but when under a heavy storm, flashes of lightning alone light up and reveal the scene,

the imagination must be even more powerfully stimulated. 'The thickest of the storm is the time lions generally make their appearance.' The power of absolute noiselessness is essential to any one who would become a great and successful hunter; the rustling of a leaf or the breaking of a twig may be fatal. But it must be an art difficult of attainment when penetrating jungle so thick that it can only be traversed on hands and knees; or when, as in the search for buffaloes, the way may lie through tunnels of reeds, in any part of which the animal may lie *perdu*; or, worse still, perhaps, when searching for wounded prey in those marvellous vegetable caves formed of creepers climbing round the thorn-trees, which Mr Drummond tells us are often so regular in their formation as to appear at first sight as if they could not be the work of Nature, but must have been trained by the hand of man. But though, doubtless, the danger possesses in itself a decided charm, European hunters are generally accompanied by natives, whose wonderful skill in spooring—namely, detecting and following the trail of different animals with unerring accuracy—is almost incredible; persistently will they follow some wounded animal, often after long hours of interval, through thicket and open, on through more thicket and open, rarely failing to come up with him at last. Buffaloes, which are the great object of the huntsman's rifle, would, but for the noiselessness above alluded to, generally receive notice of the enemy's approach from the rhinoceros bird, which perches sometimes in whole flocks upon their backs, searching for the great grass ticks on which it subsists, and utters its loud 'tcha, tcha' the moment it detects cause for alarm. This bird is, of course, a great difficulty to the huntsman, since, from its elevated vantage-ground on the top, say, of one of the buffalo's horns, it can survey the scene for a considerable distance. Buffaloes are essentially gregarious; but occasionally the huntsman comes upon a 'rogue,' or solitary bull, that has been worsted in the battle of life, and is an exile self-made, or outcast from his herd. Mr Drummond thinks he is generally one who has been worsted in the fights which are continually taking place; anyhow, this Timon of the jungle is invariably an ill-tempered brute to have to deal with.

It is a curious but well ascertained fact that the dangerousness of animals is by no means in proportion to their size—the smallest species of leopard, lion, rhinoceros, and crocodile, all being the most savage.' Mr Drummond notices this, and also that no two buffaloes even in the same herd are ever exactly alike, or two pair of horns of precisely the same shape. Dr Schweinfurth has also observed this with regard to the central African hartebeest and eland. The remarkable strength of the buffalo is shewn as often in the way he quietly makes a path for himself through the jungle and thick forests, as it is when charging his enemies. Generally speaking, the buffalo does not charge until attacked, and a shot well aimed at the forehead of the cow is almost always fatal, as it is also behind the ear. A bull, on the contrary, is nearly if not quite invulnerable in the forehead, on account of the strength and thickness of bone. There is one vulnerable spot about half an inch just above the eyes, where the bones join, but not one hunter in a hundred succeeds in bringing down an animal from a shot aimed at this spot.

Quickness of observation is essential to the safety as well as success of the hunter.

We have alluded to the wonderful skill of the African in following the trail of the animals he hunts. The requirements of their daily life are such as to sharpen this faculty to a curious point; but we may trust a Scotchman to equal, if not excel them, when any train of reasoning has to be brought to bear upon the subject. Thus, on one occasion, Mr Drummond and two native hunters started in pursuit of a wounded rhinoceros; and after agreeing that one African should accompany him, while the other kept on a parallel line on the opposite side, they entered the thicket. Soon, however, the low whistle of the solitary hunter brought the others to his side, and they found him bending over the fresh print of a rhinoceros's foot. Was it the one they were in search of? became the question, no one particularly desiring to be giving chase to two rhinoceroses at once. Mr Drummond quickly set the question at rest, having previously observed that one of the toes of the wounded animal was unusually small, and that this was undoubtedly the footprint of the same. Those who have given much attention to the natural history of these monsters know how difficult it is to determine how many distinct species are to be found in Africa. Mr Drummond mentions four—two of the so-called white, and two of the black, but objects to this distinction of black and white as misleading. He distinctly states that 'all rhinoceroses are of the same colour—a peculiar shade of brown, or if any difference does exist, it being in *R. bicornis* possessing a tinge of red.' He says, that to different observers in different localities they appear doubtless to be of different colours, but he believes all such cases may be referred to outward circumstances, such as the position of the sun, the kind of mud they have been rolling in, or to the age and sex of the animal. In exemplification of this he mentions having 'watched a bull of the *R. simus* trotting past in the full glare of the mid-day sun, when it has appeared almost white, while, after following the same animal up, and finding it feeding, with the long shadows of evening on it, its colour has then seemed to be as it really is, a deep brown.' To the four species already known to science as *R. bicornis*, *R. Kéitloa*, *R. simus*, and *R. Osuelli*, Mr Drummond would put in the claim of the *K'ulumane* to be regarded as a distinct species, 'though it has not yet received a distinct name or recognition from naturalists.' And he believes he can fully prove that claim. Of all the species, *R. bicornis* is the smallest, most savage, and most to be dreaded. Mr Drummond says he considers it the most dangerous of all African game, often vicious even when unprovoked; an instance of which occurred one night just as the hunting-party were comfortably ensconced round their camp-fire, at which the shoulder and legs of an antelope were roasting. A sudden succession of puffs and the heavy footfall of an animal caused every one to spring to his feet, and betake himself to a tree: this was the work of a moment. In ten seconds the camp-fire was trampled and scattered in all directions, water calabash overturned, blankets burned, and everything that could be got at destroyed by 'the trampling squealing beast.' We may be sure he was not let off easily. He succumbed at last. When wounded, these animals will often wait with the

utmost patience the pursuit of their foe, and then rush at him; and when they do catch an unfortunate being, says Mr Drummond, they knock him down and knead him with their feet, returning again and again, till nothing but a shapeless mass remains, uttering all day their shrill cry of rage. So difficult is the rhinoceros to kill with the spear (the native weapon), that one of the largest native regiments coming across one unexpectedly, the animal charged it; and four men were killed, besides others wounded, and a thousand spears pierced the huge monster's body, before it fell.

One of the difficulties encountered in tracking game arises from the presence of the honey-bird, whose attentions to the hunter are more pertinacious than pleasant, 'the game recognising their cry as denoting the human presence.' On one occasion, Mr Drummond, pestered by the little creature, turned and followed it; at the end of half a mile, it made a peculiar flutter, such as he had formerly seen it do when pointing out a big snake. He approached with the greatest caution, expecting to see a leopard, but found instead a hunter in his employ lying fast asleep.

Among the most noticeable of the fast-diminishing game of Eastern Africa stands the eland, as conspicuous for its beauty as the rhinoceros for its ugliness. The practice of killing them from horseback, in order to secure a larger number for the demands of the market, is so quickly reducing their numbers, that in a few years they will be difficult to find at all. They are beautiful and peaceful creatures, and their gradual extirpation seems a great mistake. Dr Schweinfurth describes them as having short sleek hair of a bright yellow tan colour, and says that in every district through which he passed, he observed their skin to be always marked with well-defined stripes. Mr Drummond, in common with other naturalists, says there is but one species, but two varieties—'the common and the striped, the latter found exclusively in South Africa, and gradually lessening in numbers, until, in Central Africa, it entirely gives way to the former.' The common kind, he says, exactly resembles the other, except in wanting the markings, and being decidedly inferior in size—the great striped cows rivalling the young bulls of the other variety in their immense proportions. An old blue bull will weigh from fourteen to fifteen hundred pounds. One custom commonly observed among these animals strikes us as the result of at least a very high order of instinct. When one of their number is wounded, and the rest startled, the herd retreats, but halts at intervals, waiting for their wounded companion; at such times, even allowing the hunter to approach very near, rather than desert the injured member of their community. And it is only the stronger instinct of self-preservation which at last compels them to move on without him. A similar instance of clanship, amounting to something strikingly akin to sorrow for bereavement, is recorded of the zebra, of which we read, that in any herd, when one of their number is killed, the rest utter a melancholy wail—a wail never taken up by the other herds which may be about, but uttered exclusively by the one which has lost one of its number.

As before hinted, elephants, through the greed of the hunters, are in many places becoming nearly extinct. There is one point of difference between

the Asiatic and the African elephant of real importance to the hunter: 'in India and Ceylon, the forehead presents a certain mark, while in Africa it is quite impervious.' An elephant charging with his ears spread like 'studding-sails,' his trunk over his head, and trumpeting loudly, must be anything but a despicable foe to encounter. But its great weight prevents it from turning quickly, and the hunter once gaining higher ground, has the decided advantage. Some elephants have a bad habit of getting tipsy on the fruit of a particular tree, and in that condition the natives dread them. On the whole, Mr Drummond rather prefers them in that state, on the principle, that it is safer to quarrel with a drunken man than a sober one. But the game we have enumerated is far from being all that falls to the African huntsman's bag: leopards, to be dreaded more for the virus of their bite, than for any man-eating propensities, often so falsely attributed to them—cowardly, treacherous, and savage, yet so valuable for their skins as to be prey eagerly sought; lions, familiar to us from many a traveller's tale; antelopes of every variety, from the little African klespringer, so like the chamois of the Swiss mountains, to the noble hyala, the great drawback to the pursuit of which is, that 'hyala-shooting and fever are all but synonymous.' Nor must we forget the little Blue Buck or Peto (*Perpurilla*), the smallest antelope in the world, being 'considerably less, as well as much lighter than a hare, with tiny straight horns, scarcely peeping over the little tuft of hair on its forehead.' One of the special pleasures attendant on the shooting of this little animal is, that it leads the sportsman into the very recesses of the African forest. It does not take a very vivid imagination to picture how much he may easily learn from and of Nature there, as he passes, in the cool of the early dawn, under the thick trees, with their wondrous foliage and rich network of creepers, a wild waste of beauty, on which, as if in mockery, some savage old baboon looks silently down; or utters, if he detects the intruder, even though he be 'a man and a brother,' a hoarse bark of alarm.

#### A LEGEND OF THE THAMES.

'FATHER,' said Ned Moffatt, 'Charley and I have been having a day's fishing in the Thames, and the young fellow Banks, who took us out in the punt, was such a character! I'm sure you would have liked him. He told us all sorts of stories about the place, and the people, and the fish, and all about himself when a boy, and how he had been a teetotaler all his life, and that the spot near the weir where we fished for barbel was called Marcus' Deep.—Why, father, are you ill?'

'I shall be well directly, Ned. Let Malcomb take away the dessert, and throw open one of the windows. There, there; I am better now.'

Mr Moffatt was a retired West India merchant, a widower with two sons, for whom he seemed to live, and they returned his love with all the fullness of filial affection. They were home for the holidays from Harrow, and their father was incessantly devising schemes for their pleasure during the few days left of their vacation.

'And was Charley as pleased with his sport and the fishermen as you were, Ned? What did you catch?'

'Oh, we got such a lot of all sorts of fish—gudgeons on the shallows, perch and roach in the quiet water; but the big fellows, those barbel, they did pull so—we got them in Marcus' Deep.'

Again Ned noticed a shadow, a twitch, a spasm, or a compound of all, pass over his father's face, which this time, it was apparent, he attempted to conceal by turning his back and covering his face with both hands.

'Father!' cried both boys, for Charley had noticed the sudden change in his parent likewise, 'what can we do for you? Will you see Dr Seton?'

'No, no!' exclaimed Mr Moffatt; 'it is merely a passing pang from an awakened memory, the recollection of which is too horrible to recall without anguish. Draw your chairs closer, and I will tell you what has disturbed me so. You will be the first to whom I have whispered it, for I did not even make your dear mother the repository of my secret.'

Ned and Charley, struck dumb by the serious voice and visage of their father, mechanically did as they were bid.

'Well, boys,' began Mr Moffatt, 'I was about thirty years of age when I fled this country for the West Indies, making over my affairs to the agency of a friend, to whom I stated neither reasons nor excuse for my sudden departure, or rather my flight. My affairs at the time were prosperous, and therefore no prejudicial suspicion attached to my resolution; at the most, perhaps, amongst my acquaintances, it was thought to be attributable to a love-affair. No. At that time my heart was as free as air, and every circumstance tended to heap fortune and happiness on my head, until one fatal morning! You will perhaps be surprised to hear that, at the period I speak of, the only resource I cared for from the anxieties of business—which, I must say, went smoothly and easily with me—was that of angling, that art, the love for which you appear to have inherited from me, and to which attachment I have scarcely ever trusted myself to allude until now. Saturdays were the days appropriated during the season to my favourite pursuit. In order to follow it to the full, I rented and furnished a little cottage on the banks of the Thames. There I used to run down on the Friday night, be up with the sun in the morning, and find my fisherman ready with tackle, punt, and all needful to get afloat. This was now the happiest portion of my life, for the confinement of the previous part of the week in murky London prepared me for a pleasure keen and intense. Then the calmness and sweet peace of the succeeding day more than armed me for the recurring city routine. Well, the last Saturday that I ever held a rod or saw the morning mists clear off from the Thames, I was out long before their dews were dispelled, and found my man, as usual, punctual, and waiting for me. After I had got on board, however, I recollected that I had left some tackle I should require, and throwing my bunch of keys to my fisherman, bade him hasten and fetch it from the cottage. He was longer gone than I expected, and when he did come back, I noticed that he was the worse for drink. His speech was thick and incoherent. He was more than usually loquacious; and a something of disrespect towards me, which I had never before noticed in his mode of address, assured me he had

been drinking while absent on his message, and thus had broken a sacred pledge he had made to me to abstain from liquor. This promise he had hitherto observed with exemplary fidelity. I made no comment upon his condition as he sprawled, rather than stepped, into the punt, hoping the fresh morning air and the hard exercise he must undergo against the current before we got to the weir, would restore him to sobriety. As we took advantage of the back eddies, to get to a particular spot where we purposed to tie the punt to one of the stanchions of the weir, a trout of formidable size threw itself high out of the water, and came down with a heavy splash, the noise of which could be heard over the roar of the fall of the weir.

"Do you know," he remarked with a hiccup, "that the whole of the time, man and boy, I've been a Thames fisherman I never caught a Thames trout! I get precious chaffed by my fellows, as most of 'em have had some, and many of 'em their half-dozen of that fish. There he is again! If he's one he's twelve pounds, and I intends having him, or"—— And here followed a savage oath.

'We had now got close to the piles of the weir. The man, however, instead of putting my rod together, as he always did, preparing it with spinning-bait for my use, and seeing me fully at work before he did anything else, deliberately arranged his own tackle, muttering the while: "Ah! I intend to have that trout—Bill Smith and Harry Jones shall have no more shies at me on that hook—or," &c.

'Thus far I let him have his own way. But when he began to stagger about the punt, and nearly caught me, now in the face, and now by the legs, with the row of hooks, in his clumsy attempts to cast the line, which he stumbled over, trod upon, and got entangled about him, I thought it time to expostulate. This was useless. He had got it into his besotted brain that I was some "pal," as he called me, whom he had honoured by bringing out to see him catch his first Thames trout. I then insisted upon his putting me ashore, for our position, as the punt swung round in the boiling waters, threatening now and then to suck us beneath the fall and swamp us, was more than critical. But he was deaf to all threats or persuasions. The trout he must have, or meet the fury of another element. Under these circumstances, I did what I had often done before on less urgent occasions; I got out, and steadying myself by the timbers, mounted the sill or fixed beam of the weir itself, which having no guiding rail, the footing depended entirely upon a steady eye and firm nerve, the more as the running water over it had, although but ankle deep, a constant inclination to carry one off his feet. Here with my spinning rod, which I had with some difficulty managed to bring upon the weir, I had every advantage, and casting very far down the stream, spun my bait, a small bleak, slowly back; and when about half the line was gathered in, I felt a tremendous rush, which carried nearly all my line off the reel. I was, therefore, at once conscious I had hold of a formidable trout, and I played it with my usual coolness and skill, for such prey were not strangers to me, either in that river or in other waters. My operations had up to this point been unobserved by my man, who was otherwise occupied. The

beautiful creature, however, throwing itself out of the water in one of its noble efforts for freedom, attracted the fisherman's attention. He uttered a loud curse, threw his rod down in the punt in evident rage, then, to my intense surprise, floundered out of the punt on to the apron of the weir, and commenced scrambling up to the top of it. This was an event I certainly did not anticipate. That it was this madman's design to contest with me the capture of the fish, I was soon made certain by his every gesture. And now my fear was that the fellow, in the state he was in, would not be able to keep his equilibrium—that he would fall over, get washed off the apron before he could recover himself, and be plunged into the pool, from which, if he once got amongst the dead-water under the swirl, nothing but the greatest presence of mind, and a full knowledge of the peculiar nature of the currents, could possibly save him. Still he came on to me with his arms outstretched, balancing himself upon the narrow and slippery beam which formed the crown of the weir, like a boy walking on a rail. When he got within arm's-length of me, I warned him to keep his distance, and earnestly besought him to recollect that he was jeopardising two lives by his desperately rash and unaccountable conduct.

"Give me the rod!" he shouted, with an awful imprecation. "The fish is mine. I *will* have it; I spotted it first. Give me the rod, I say!" He now literally foamed at the mouth with excitement. He clutched me with one hand by the shoulder, and I felt the gripe of the maniac (so tenacious was his grasp) take up the muscle with my clothes. With the other hand he made a snatch at the rod, which was on my left, which he had to get partly in front of me to reach. I would have resigned the tackle willingly at this juncture. It was too late. In his exertions to seize the rod, he had thrown himself out of balance, and feeling himself going over, he seized me by the waistcoat with the hand at liberty, and the next moment we were both rolling over and over and down the apron. A heavy splash, and all was blank. Being, however, a skilful swimmer, and life at that moment my first consideration, I kept my head *downwards*, as my only chance to rid myself of the embarrassing hold of my companion, which at once relaxed, when I became free to act. Knowing that if I attempted to rise to the surface in the spot I was I should only be carried under again, and that if this was repeated two or three times I should become exhausted, I struck for the bottom, and there found it dark and comparatively still. Here a thought flashed across my mind, by no means reassuring, for I had often reflected that if I ever reached that spot, the probability was that I should be sucked under, and never come up again. Instead, therefore, of attempting to rise, I crawled and swam a dozen yards or so on the shingle, until I saw the sheen of day above, which I knew from its transparency to be the still water of the eddy between the lashers. Now or never! and up I went, rising, as I expected, in the eddy, which whirled me several times round, and then carried me into the run of the water. At this moment, my alarm was great at finding I was tightly fastened to something. I summoned courage, and ascertained that I had got entangled in my line, but, thanks to the confidence I had acquired from my swimming-master in what he called ornamental buoyancy, I

threw myself on my back, and after a little manœuvring, the current carried the line clear. Then a few vigorous strokes took me into the back eddy, and I swam into wadeable water. I may here tell you that to try to rise in any other way in such an emergency is hopeless. Several persons have been drowned in the pools of these weirs on the Thames, and their bodies have been invariably found in the cavity worked by the water, with their hands stretched out, as if endeavouring to push themselves off, but were held there by the suction.

Here Mr Moffatt paused, took a long breath, and finding that his two boys were perfectly transfixed with painful suspense and attention, proceeded.

"Well, directly I could look back, I scanned every portion of the waters, but could not see anything of poor Marcus."

"Marcus!" exclaimed the boys—"Marcus' Deep!"

"Yes, that was the poor fellow's name, and I have had his death lying like a frozen chill upon my conscience ever since."

"But, father"—interposed Charley.

"I know, my boy, what you would say: that it was the man's own fault; that he might have been my murderer as well as his own. I have thought of all that. But it affords no consolation, as, knowing the state the man was in, I ought at once to have surrendered the tackle, and given way to his whim. No; the man was not responsible for his actions, in one sense, and I cannot shake off from myself the feeling of guilt."

"And now, boys, you have heard the story of poor Marcus, whose untimely end has been on your father's conscience for many a year."

That night, as Ned and Charley lay in bed together, they talked in bated breath over what they had heard, and pitied their father from their innermost hearts.

"I'll tell you what, Charley," said Ned suddenly, "I must know more about this affair. No harm can be done if I don't talk about it, but I am determined to learn more by the water-side. Look here, Charley—was Marcus' body ever found?"

"I think you had better leave the body alone," said Charley with a movement between a yawn and a shiver, and the next minute he was fast asleep.

Ned kept awake that night, thinking, and the more he thought, the more was his course the only one that offered any solution to the mystery, if any, of the sad story. As soon as the morning dawned, he was out of bed, dressed, and off with his fishing-rod and basket by the first train. He found the fisherman in his front garden, digging worms for his cel-pots, and as he was not otherwise engaged for the day, he was ready to go afloat. So, after providing a small hamper of refreshments at the inn, they were soon punting against the stream for Marcus' Deep.

"How long, Banks, do you say it is since you have not drunk beer, or that sort of thing?" asked Ned, as he saw the fisherman take a swig of cold tea after his exertion.

"Ever since I was *that* high," replied the man, placing his hand about a couple of feet above the gunnel of the punt; "ever since I was six year old; and I'm wondrously thankful for this very place we are now fishing for that, though it did no good to some one else."

"No good to some one else," thought Ned

mentally. 'Suppose, Banks, we have two or three more balls of ground-bait in. Did the anglers fish here much after the fisherman was drowned?' he inquired with as much indifference as he could affect.

'There has been no fisherman drowned here that I ever recollect, although one was very nigh to. A gentleman was. But even at this time o' day—for it's twenty year ago—it don't do for me to speak of it, and if you please, sir, I'd rather not talk about it.'

'But it's called Marcus' Deep because a fisherman of that name'—

'Well, sir, you'll excuse me, but I never speak about it more than I can help, and I'd rather not.'

'But,' continued Ned persistently, 'do I understand you to say that there was no fisherman drowned here, but that a gentleman was?'

'I don't know how I have come to say so much,' said Banks, with evident emotion; 'but when I tell you that there are persons living who might get into very great trouble if I was to gabble any more, I am sure, sir, as a gentleman, you will excuse my holding quiet.'

Ned, whose whole anxiety was for his father, tacitly acquiesced in the wisdom of silence.

That day, at dinner, Ned much startled Mr Moffatt by telling him he had been again to Marcus' Deep. Indeed, his father was shocked to learn that the recital of his secret should have had so little effect. Ned, seeing what was passing in his father's mind, without further preface or preparation, remarked: 'Why, father, I have heard to-day that instead of the fisherman being drowned in that weir pool, it was the gentleman.'

'The gentleman?'

'Yes, indeed; it was the gentleman, and not the fisherman.'

'Are you certain of this, Ned?' ejaculated his father, starting to his feet. 'Can this be true? The very possibility of that poor man having escaped has never occurred to me. No, no,' he added with a groan, and sinking into a tone of deep sadness; 'he could only have been saved by a miracle.'

'But, father,' urged Ned, 'Banks the fisherman told me he knew all about the affair. He told me the fisherman was not drowned, and the gentleman was. If he is correct—which you can now easily ascertain—you have only to make yourself known in confidence, and Banks, I am sure, will tell you all. When I left him, I begged him not to engage himself for to-morrow, as I meant to bring a gentleman down with me to fish, who, years ago, used to be very fond of the place.'

'Meaning me?' observed Mr Moffatt, his hopes again reviving. 'We will go to-morrow, Ned; it is a matter that I cannot now delay an hour unnecessarily.'

Next morning found Mr Moffatt and his two boys afloat with Banks; and Ned watching his father closely, saw how greatly the scene of the weir and its turbulent waters affected him, although it was so many years since the event had occurred which had thrown its shadow over the whole of that period.

When properly mooded, Mr Moffatt's impatience being wrought to the highest, he broke the subject at once, and was induced, as the best plan of getting at the facts which Banks could render, to tell him he knew the gentleman supposed to have been drowned, and that he was alive, if not well.

Banks's delight at this revelation was great, so unbounded indeed, and expressed in such grateful and vivid terms, that it even exceeded that of Mr Moffatt, who began to see plainly that this manifestation closely concerned his own happiness. Banks, therefore, now having no longer any cause for taciturnity, related all he knew of the occurrence. But we will let him tell his own story, almost in his own words.

'My father, Marcus Banks—better known as Marcus the fisherman—was a great favourite with a gentleman who used to come down in the summer to that little white cottage you see near the ferry yonder. I believe my father equally liked his customer, for by his influence he had become, from being often unable to go out with gentlemen, from too much drink, a regular sober steady man, respected by his neighbours, spoken well of, and often recommended as the best man in the village by our clergyman. One night—the last I saw my father for years; I was then but a snap of a lad—he told me he expected the gentleman down from London, and that he had been all the afternoon getting baits and other things, so as to have a good day's sport. It was late before he came to bed, and he was then as sober as usual; and I recollect no more than being slightly disturbed when he got up at twilight in the morning, and left me to fall asleep again. I don't know what time it was when I was suddenly awakened by the door being burst in, and father dripping wet, his hair on end, his eyeballs starting out of his head, and his whole body trembling as if he had had the palsy, throwing himself with a wild scream across the bed. I started up in my fright, and listened with horror to my father accusing himself of murdering—coldly murdering his customer by throwing him off the weir. His wailings and writhings were fearful. He seemed wholly unconscious of what he did. One moment he would stand up and declare he didn't do it, with the most awful appeals to Heaven; the next, he would fall on his knees and beg for mercy. "Don't hang me, don't hang me!" he would scream; and then he would sob like a child, as though his very heart were bursting. For some while—an age to me—he seemed not to know of my being there, and then, when he did so, he seized me in his arms, kissed and fondled me, and asked me what was to become of me when he was gone. Then he pushed me away from him, and screamed again: "I will tell you all; but don't hang me; spare me, spare me, for my poor lad's sake! Look here. Gentleman wanted something from the cottage. He gave me his keys. I opened the wrong cupboard, and there a bottle of brandy toppled over, and broke at the neck. Some of the cursed spirit fell on the shelf, and ran dripping off. I caught it in the palm of my hand and drank it—the first I had tasted for years, as Heaven is my judge. One sup led to another, and I filled a tea-cup again and again, and drank. I know of little more but that the punt was full of my mates trying to cheat me out of a large trout I had gone out to catch; they jeered and mocked all my attempts to get it, and one after another got out of the punt to avoid me, on to the weir, where I followed them; and I struggled to get the fish with the first fellow I came up to, and—and, as I went down in the water, I saw it was my customer I was drowning."

'These were his words, gentlemen, as near as I can remember. Then he started up again, and muttered that he must be off—that the police were after him, and rushed to an old chest of drawers, scrambled up together a few clothes, and the next moment I was alone, rubbing my eyes, thinking all was a dream. There was plenty to eat in the house, but all that day I should have choked had I attempted to swallow a morsel; and as night drew on and my father did not return, I began fully to believe that he had committed some frightful offence, and that I was deserted. In the latter respect, however, I was wrong, for the latch was lifted, and a woman entered the room, and said she had come to fetch me. I was so bewildered, and thinking perhaps she was going to take me to my father, I made no objection; and she took me to a pretty little cottage about three miles from this, on the common. There I was well clothed and fed, and when old enough, was sent to school as her adopted child. I did all I could to shew my benefactress that I was grateful, but I always yearned after the water and my father's pursuits. So, as I was considered able to manage a punt, one was bought for me, and I was set up in the house in which I was born, as a fisherman. I am sorry to say my benefactress is since dead.'

'Poor Jane Scott,' sighed Mr Moffatt, 'she was housekeeper to my friend, whom your father supposed to be drowned. And of your father?'

'Well, sir, I heard that he went wandering about for some months under a feigned name, living the best way he could, and that now and then he used to come over to these parts in disguise, to get a look at me. One day, about two years ago, old, and worn, and ragged as he was, he was known by something he let fall in his inquiries at the bar of a beer-house, and a few of the villagers hearing of it, took pity on him, kept his secret, and got him into Moffatt's alms-houses.'

'Moffatt's alms-houses!' exclaimed both Ned and Charley.

'Yes,' went on the fisherman; 'they were founded by a gentleman in the West Indies, who is said to have done so in gratitude for some reason or other we never learned the rights on.'

'Your father is living, then?' asked Mr Moffatt eagerly.

'That he is, sir; and he is hale and hearty, but bowed with the weight of the secret he fancies his life depends upon the keeping. You will see him, sir, waiting for me on our landing, for this is the day in each week he comes down for a dish of eels to treat the old men and women at the alms-houses.'

We need not dwell upon the meeting of the two 'drowned' men, nor attempt to describe the exquisite joy of all concerned, as the way was led by the fisherman's son up to Moffatt's alms-houses, where the founder shared for the first time in the happiness of the recipients. He now learned from Marcus Banks himself that he was miraculously saved from drowning by his coming up to the surface between the stanchion of the weir and the punt—that he had clung to the latter for some time before his weakness and condition permitted him to get into it, which accounted for Mr Moffatt not being able to see him, and presuming him to be lost. Having got into the punt, he lay for some time insensible; but when he recovered, and had realised the awful nature of his

situation, he hastened ashore, sought his home in the state his son described, and fled, to follow a vagabond and precarious, and infinitely worse, a haunted life for years.

The bells of the village church were set ringing that evening, rejoicings were general as well as at the alms-houses; the next Sunday, the vicar improved the occasion by a sermon on the events. The cottage was again set in order; and Mr Moffatt, now more often than in his younger days, seeks with his sons, when they can be spared from their studies, and with young Banks, the pleasure round and about the once dreaded, and supposed fatal, Marcus' Deep.

#### BRIDGING GREAT INTERVALS OF TIME.

THE late Dr R. CHAMBERS, in certain papers in these pages, in 1833 and 1839, gave some amusing instances of the manner in which distant ages may be connected by the lives of individuals—for instance, a person we know may have spoken to another who had been an eye-witness of moving historical events more than a hundred years ago.

The subject is one that may from time to time be interestingly adverted to. The circumstances which have passed under the notice of a single long-lived individual are sometimes matter of wonder to the young. The late Lord Lyndhurst lived till 1868; yet he had seen the birth, growth, and maturity of the republic of the United States of America, for he was born in Massachusetts, at a time when that and the other eastern states were British plantations or colonies. In his ninety-two years of life, he had seen the whole history of the great republic. In 1874 died Paymaster Thorne, the oldest naval officer in the Queen's service; for he received his first commission in the days when Lord Nelson was still living, fighting, and conquering. Still more remarkable was the case of the late Field-marshal Viscount Combermere; he was a commissioned officer in the British army in 1791, and a commissioned officer he was in 1865, when death carried him off at the age of ninety-two. During his passage through all the military grades from ensign to field-marshal, he had been conversant with the wars relating to two republics, two empires, and several monarchies in France. Most noteworthy fact of all, Combermere and the great Napoleon had been subaltern officers in the self-same year, the one (English) as Ensign Cotton, the other (French) as Lieutenant Bonaparte; and yet Napoleon has been dead more than half a century! When George IV. visited Edinburgh in 1822, he had an interview with one of the men who had fought for Prince Charlie in 1745; the king pleasantly welcomed him as 'the last of his enemies.' One Mr Evans, who died in 1780, was wont to speak of having witnessed the execution of Charles I. in 1649; but this assertion is sadly in need of corroboration.

When two aged persons are concerned, the one born shortly before the death of the other, a much longer space of time may be bridged over by a retentive memory. James Horrocks, born in 1744, and surviving till 1844, was the son of William Horrocks, who was born in 1657, during the Protectorate of Cromwell. James, therefore, in the present reign of Victoria, could talk of his sire having been contemporaneous with the stirring events consequent on the downfall of the first

Charles. If these dates are correct, William must have been more than eighty years of age when his son James was born. Mr and Mrs S. C. Hall, when travelling in Ireland in 1840, were introduced to a venerable man who could tell them that his father had been present at the battle of the Boyne, a hundred and fifty years previously, when a boy of fifteen; this was possible if the father was (say) seventy-five when the son was born, and the latter ninety at the date of the interview. The Earl of Mansfield, in 1787, narrated that he had conversed with a man who had witnessed the execution of Charles I. In 1823 Mr Andrew Coventry stated that he had dined with the mother-in-law of the Young Pretender, Prince Charlie. This strange connecting of two periods was thus explained. Princess Stolberg had a daughter, Louisa, who married the Pretender in 1773, when he had become a middle-aged man; there was an interval of eighty-five years between the birth of Prince Charlie and Mr Coventry; yet the latter had dined with the Princess Stolberg, when she was a venerable dame of ninety. Lord Torphichen, living in 1862, had an uncle who was an officer in the royal army in 1745, fighting at the battle of Prestonpans; and another uncle who, as a boy, was concerned in a so-called witch adventure in 1720: facts which seem to shew that the Torphichens were a tough old race. James Stuart the architect, known for his classical knowledge, as Athenian Stuart, died in 1788, at the age of seventy-six; he had a posthumous son born in that year, and this son lived to be Commander Stuart of the royal navy, who was living till 1861, if not later: the father and son between them thus covered a hundred and forty-nine years at the least.

The following are further instances belonging to the same class. In 1713 a venerable matron was living who might, in one sense, have been called a niece of Mary, Queen of Scots. It arose thus: Francis II. of France was the first husband of the hapless Mary, he being at the time of the marriage, in 1558, fifteen years of age, and known as the Dauphin; he became king in the following year, but died after a reign of only a few months. His brother succeeded him as Charles IX. in 1560, and had a natural son, to whom the title of Duc d'Angoulême was given; this king died in 1574. The duke's widow lived on to 1741, when she died in extreme old age. She, therefore, survived her father-in-law by no less than a hundred and thirty-nine years; and as Francis and Charles were brothers, she was, therefore, a kind of step-niece of Mary, Queen of Scots. In another instance, a gentleman, living in 1872, was the son of a person born in 1722; the two thus bridging over a hundred and fifty years between them. If the father was (say) fifty-five when the son was born, and the latter lived to the age of ninety-five, this would fulfil the conditions. Maurice O'Connell, father (we believe) of the great agitator, died in 1825, at the advanced age of ninety-nine; in his youth, he had known an aged man, named Daniel M'Carthy, who had been present at the battle of Aughrim in 1691—a man had seen a man who had witnessed an event a hundred and thirty-four years before the decease of the former. The Countess of Loudoun, widow of the third earl, was born in 1677, and lived to be almost exactly a hundred years old; she was

attended professionally by Dr John Mackenzie, who survived till 1841. In this case, a medical man, in the reign of Victoria, could say that he had attended a lady born in the reign of Charles II.—covering the reigns of eight intervening sovereigns. Dr Routh, President of Magdalen College, Oxford, held his presidency to the day of his death in 1854, when he had entered upon his hundredth year; when a young collegian, he knew Dr Theophilus Leigh, who had been Master of Balliol College at the time when Addison was an Oxford student, about the year 1695. This was a clear leap of more than a century and a half covered by two learned men during their academical career. Sir Stephen Fox, born in the first half of the seventeenth century, had a family by his first wife; and one of his sons was Paymaster of the Forces in 1679. He survived his wife and all the children; married again at an advanced age in Queen Anne's reign; had two more sons; and one of these sons became the father of the celebrated statesman, Charles James Fox. The statesman, therefore, just before his death in 1806, might have said: 'An uncle of mine was a member of the government a hundred and twenty-seven years ago.' The case of Commodore Pickernell was another remarkable one. This tough old sailor, who died in 1859, at the age of eighty-seven, knew in his youth an old man who could tell of having been encamped as a soldier on Hounslow Heath at the time of the Revolution in 1688. When quieter days came, the soldier played as a bandman at the coronation of Queen Anne; and next served throughout the Duke of Marlborough's campaigns. There is something a little startling about these dates; but, as Pickernell was barely eight years old, and the veteran a little over a hundred, when they met, the difficulty may be solved by supposing that the soldier was very young (say a drummer-boy) at the time of encamping on Hounslow Heath.

A distinct series of these curious phenomena is presented when *three* persons are concerned in transmitting the record. Mr Ramage, in 1872, communicated to one of the journals the following: 'When I was a boy, I was acquainted with an old woman named Margaret Clench, who lived in a cottage within the Drumlanrig domain, at a short distance from Drumlanrig Castle. She had in her youth been in attendance on Catharine Hyde, the wife of Duke Charles of Queensberry. Duke Charles was born in 1698.' Thus, a gentleman writing in 1872 could say that he had seen a woman who had seen a man who was born in 1698; the space of time included being one hundred and seventy-four years. William Oldys, the learned bibliographer, who died in 1761, had known a lady who connected him with Waller the poet, born in 1605. The facts and dates stood thus: When James II.'s younger daughter was still Princess Anne, and he still undisturbed by the Revolution of 1688, one of her maids of honour was a daughter of Sir John Talbot; she paid a visit to Waller when he was eighty years old; and she herself, when a venerable widow, Viscountess de Longueville, was visited by Oldys, at that time a septuagenarian. Mr Frank Buckland, writing to *Land and Water* in 1872, stated that Dr Routh of Magdalen College (whose name we have already had occasion to mention) had in his youth seen an old woman who in her youth

had seen Charles II. walking in Oxford with his favourite spaniel. There seems, however, to be one intermediate life omitted here; for in a notice in the *Times* of Dr Routh's death, 1854, we learn that 'he had been told by a lady of her aunt, who had seen Charles II. walking with his dogs in Oxford in 1665.' There were thus *two* ladies and Dr Routh to connect the widely-distant dates. Mr Buckland mentioned another case, of a friend, Mr H—, who told him that when ten years old he used to sit on his grandmother's knee, and listen to her account of what took place in 1745, when she was eleven years old; that she was at that date residing at a farmhouse in the western part of the county of Durham; that some of the adherents of the Young Pretender passed that way; that she assisted her mother in succouring them with bread, cheese, beer, and other refreshments; and she recollected that the poor fellows fell on their knees, and thanked in Gaelic their kind hostess. Now, Mr H— had a daughter born in 1868; if she lives to the age of eighty, she will be able to say: 'My great-grandmother fed some of Prince Charlie's troops more than two hundred years ago.'

Dependent on a similar number of lives are some other instances which deserve brief notice. The Scottish newspapers in 1766 recorded the birth of a child to Lady Nicolson of Glenbervie; her husband, Sir William, was ninety-two years old at the time, having married his second wife when he was eighty-two; there was an interval of sixty-six years between the birth of his first daughter by his first wife and his youngest daughter by his second wife. We have no record of the death of this youngest daughter, but supposing her to have lived beyond her eightieth year, she might have said in 1846: 'My father was born a hundred and seventy-two years ago, in the time of Charles II.; and my eldest sister was born a hundred and forty-six years ago.' This case was a specially remarkable one, in one at least of its features. More within the ordinary run, but still noteworthy, was the instance of Dr Franklin, who was the grandson of a man born in the time of Queen Elizabeth; Benjamin Franklin himself died in 1790; and thus he, his father, and grandfather, covered two centuries. About the year 1539 was born Miss Lettice Knollys, who eventually became by marriage Countess of Essex in 1556, Countess of Leicester in 1578, and Lady Blount in 1589. This courtly lady, who did not quit the scene of life till 1634, was a great-niece of Anne Boleyn, and might, very probably, as a little girl, have seen Henry VIII.; she certainly saw Edward VI., Queen Mary, Queen Elizabeth, James I., and Charles I. Lettice belonged to a family very retentive of life; for her father reached the age of eighty-five, one brother eighty-six, another brother ninety-nine, and herself ninety-five. Another courtly lady was in a position to say, shortly before her death in 1858: 'King Charles II. was present at the marriage of my grandfather, and gave away the bride nearly a hundred and ninety years ago.' This leaping over a wide gap of time seems rather startling; but the facts and dates arrange themselves in the following way: James, the fifth Earl of Balcarras, was a naval officer in the service of Queen Anne; he had come to the earldom as successor to his father, the fourth earl; Charles II., near the close of his reign, had given away the bride at the first

marriage of this fourth earl; of the years of birth and death of the two noblemen we need not take account; but Earl James's daughter Elizabeth became Countess of Hardwicke, and survived to a very advanced age in 1858.

It has been pointed out that when George IV. ascended the throne in 1820, the self-same decorations of the Order of the Garter which he then received were those which had been worn by his ancestor, Charles II.; and it was a remarkable fact that there had been only two intermediate holders in that long period. Charles II. conferred them on the Duke of Somerset, who retained them till his death at an advanced age in 1748. They were then conferred on the young Prince of Wales, at that time a boy of eleven or twelve years of age; he retained them for no less than seventy-two years, twelve as Prince, and sixty as King George III.; after which they passed to his eldest son, George IV. The Duke of Somerset and George III. between them held the decorations uninterruptedly for a hundred and forty years. In a most unusual degree was the duke a participator in courtly ceremonies wherein stars and garters are more or less likely to be worn; under no less than six sovereigns in succession; for he was one of the pall-supporters at the funeral of Charles II., the bearer of the orb at the coronation of James II., the bearer of the queen's crown at the coronation of William and Mary, the supporter of the chief mourner at the funeral of King William, the bearer of the orb at the coronation of Queen Anne, again its bearer at the coronation of George I., and once again at that of George II.

With regard to the historical value of these remarkable leaps over wide intervals of time, it may be well to bear in mind that the fewer the intermedia, the persons concerned in handing down the testimony, the less likely is the story to grow untruthful by repetition. On the other hand, some of them are exposed to the influence of defective memory in old age. When a garrulous old man talks about the events of his youth, he is not always reliable as to dates, though honestly intending to speak the truth. Nevertheless, after making all necessary deductions, these phenomena as to memory are certainly worthy of attention.

## THE AXOLOTL.

AMONG the later additions to the Brighton Aquarium is the Axolotl (pronounced A-chólatl) or Ajolote, a curious creature, which has perplexed naturalists ever since its first introduction to the scientific world. The singularity of this creature consists in its being one of those animal existences properly termed 'Protean'—partaking partly of the character of a fish, and partly that of a reptile—and in its possessing certain other strange physiological distinctions, too abstruse for the general reader. Any one desiring scientific elucidation on the subject will find it so treated in a paper read by Sir Everard Home before the Royal Society so long ago as 1824, and published in the *Transactions* for that year. We shall here confine ourselves to giving a brief account of this Protean in regard to its habits, habitat, and the uses to which it is put by the people inhabiting the Valley of Mexico—the only place where we have any account of its having been found. And just a word about its structure and appearance.

As all know who have seen it in the tanks of the Aquarium, it bears resemblance to a gigantic newt or salamander; at the same time the possession of 'gills,' with other points of similarity to the finny tribe, suggest its being something of a fish. Its size, as commonly seen, is from that of a sprat to a herring; but specimens have been taken of much greater dimensions—some measuring sixteen inches in length; its long tapering tail included in the measurement. It has a large head, with a widely extended mouth, the tongue being flat, thin, and cartilaginous. In lieu of fins, it has four feet, somewhat like those of a lizard or frog, and by these it propels itself frog-fashion through the water. Its colour is a mixture of black and white, with some variety in the markings according to age and sex.

The axolotl is an inhabitant of the great salt lake Tezoco—the largest of the six lakes (formerly there were but five) now existing in the Valley of Mexico; and as far as is known, it is confined to this one, the water of most of the others being fresh, and seemingly not suitable to its existence. Tezoco is now of much smaller extent than at the time of the Mexican Conquest. Then it washed the walls of Tenochtitlan, the ancient capital of the Aztec Empire, completely encircling it. At present, the lake's edge is more than a league from the suburbs of the modern city of Mexico, which occupies the same site as did Tenochtitlan. Notwithstanding its contracted dimensions, Tezoco is still a grand sheet of water, having a superficial area of over one hundred square miles. Its depth, however, is but small, no part of it being more than four English feet, according to a series of one hundred and twenty-seven soundings, taken by a scientific commission, under the directions of the Mexican government. Humboldt gives its depth, at the date of his visit, 1803, from three to five French mètres. The great traveller must either have been misinformed—the soundings of the lake not then having been scientifically verified—or it has since shallowed by evaporation and silting up. The water is extremely salt, and no fish can live in it, with the exception of here and there, at the mouths of certain fresh-water influent streams, some diminutive minnow-like species, by the Mexicans called 'juiles.' But these never venture out to the body of the lake, which is left to the axolotl, which alone finds its saline character congenial. Even upon these shores vegetation scarcely shews itself, or only in a few stunted plants of species that thrive best in soil impregnated with saline particles. All around Tezoco we see sterility equalling that of the Sahara, the surface of the adjacent plains, with such scant herbage as appears upon them, being covered with a white efflorescence like hoar-frost.

In this Dead Sea of the western hemisphere dwells this strange animal. But although having all the lake's water to itself, it is not left either undisturbed or unmolested. Cranes, pelicans, and other predatory wading-birds make war upon it; and it has furthermore to fear man. For, despite its somewhat repulsive appearance, it is esteemed as an article of food, and is in consequence an object of piscatorial capture. The 'lake Indian'—descendant of the Aztecs—is its greatest enemy. He not only pursues it with avidity, but eats it with the greatest gusto; to him it is a tit-bit, a *bonne bouche*. And indeed others besides the

aborigines often deign to partake of its flesh, which they say is white, delicate, and savoury. Skinned, and broiled, it is not only eatable, but fairly palatable; while it is also supposed to possess valuable medicinal properties. Doctors recommend it for inflammation of the liver and hectic fever; and it is considered healthful food for children. A syrup compounded from the gelatinous portions of the body, with certain herbs, is sold in the apothecaries' shops of Mexico, as a mucilage beneficial in pulmonary complaints.

The axolotl did not escape observation by the historians of the Mexican Conquest. Clavigero, Salagun, and others of the early writers, have each given account of it—all deeming it an odd animal—some of them believing it to be in an imperfect or undeveloped state, as the tadpole before its final transformation to a frog.

The light of science first thrown upon it by Humboldt, but more fully by Sir Everard Home, has dispelled these erroneous ideas; though still leaving doubtful many points in the zoological affinity of this singular aquatic creature.

#### THE REAPERS.

THE reapers bend their lusty backs;  
Their sounding sickles sway;  
At every stroke the golden sea  
Recedes to give them way;  
The heavy ears fall bowing down,  
And nestle at their feet.  
Such will, such work as theirs, perforce,  
Must win—must homage meet.

So careless of fatigue they go,  
So true, so steadily,  
The admiring traveller on the road  
Leans o'er the gate to see;  
With marvel of the soon-fallen breadth,  
The lounging gossips tell;  
But the reapers labour for us all:  
'Tis need they should work well.

Ere the great sun that burns above  
Shall crimson in the west,  
And the children's poppy nosegays fade,  
And they lie down to rest,  
Each golden spear that upward points  
Shall fall upon the field,  
And the farmer drain a sparkling glass,  
Rejoicing o'er the yield.

O'ly, bonny men, your sickles bright,  
And give the people bread!  
At every conquering stride you take,  
On want and woe you tread.  
Drop, heavy ears, and give the strength  
You gathered from this plain,  
That man may rise refreshed and firm,  
And do great things again.

God bless the hands, all hard and brown,  
That guide the cleaving plough,  
That cast abroad the shining seed,  
And build the wealthy mow;  
They rear the bread our children eat;  
'Tis by their toil we live;  
Hurrah! give them the loudest cheer  
That grateful hearts can give!

## SOME EARLY RECOLLECTIONS.

FOURTH PAPER.

I HAVE to say a few more words regarding the French prisoners of war, but before doing so, I propose to tell a little story of humble life.

In a thatched cottage not far from my father's residence in the small town by the Tweed, so often referred to, there dwelt a decent old woman, a widow, with her grown-up son and daughter. It was a primitive unassuming establishment. The family, though well off, lived in a frugal old-fashioned manner, incurred no debt, and were scrupulously attentive to religious duties. By the death of his father, Will Broun, as he was familiarly called, dropped into the enviable position of a *bonnet laird*—that is, a land-proprietor on a small scale. Besides the cottage, consisting of a *but* and a *ben* (an outer and inner apartment), and a good garden in the rear, he inherited several patches of land, perhaps amounting altogether to six acres, such being amply sufficient for raising potatoes, as well as grass and turnips for a cow. As, beyond all these riches, a certain income was derived from Will's industry, things were placed on a pleasantly sound footing. All that he needed to do was to hold quietly on, as his forefathers had done for I cannot tell how many generations.

Some people, as the saying is, do not know when they are well off. Scottish folly and extravagance are a pretty common method of ruination. Will brought himself to poverty through an entirely different course of procedure, such as I have never seen noticed in literature; perhaps because no one could conceive anything so utterly ridiculous. He had a good education—so good, that he was able to translate the scraps of Latin on the tombstones in the churchyard, on which he would sometimes expatiate; and here I touch on that thread of vanity which ran through his complicated character.

This pretension to scholarship was a weakness, but a harmless weakness, and one could have passed it over, had Will shewn any robustness of character otherwise. Unfortunately,

Will became acquainted with an Irishman of a humble type, one of those who visited Scotland with a view of picking up a few bounties to act as substitutes in the militia, and who, on pocketing the cash, set off on their way home—such being a far from uncommon plan of making a little money during the heat of the French war. Influenced by the counsels of this adventurer, Will, in company with a townsman, made an excursion through Ireland, and from that time may be said never to have done any good. Demoralised, from the haunts into which he had been drawn, he returned with a fanatical veneration for rags, Irish mendicants, and indeed everything which savoured of an abject social condition. According to his notions, all that was estimable belonged to the poor and struggling classes; all who moved in a dignified, or simply respectable position, were worthless oppressors. Everybody, of course, laughed at and pitied these whimsicalities. Will was in a certain sense crazy. 'He's no an ill fellow,' neighbours used to say; 'he's clever and weel educate; if he would only mind who he's come o', and have a wee bit pride, there would be nae fear o' him; instead o' that, he tak's up wi' low companions, and they'll some day be his ruin.' Such, as I recollect, were the prognostications about this strange being—and they were verified.

Taking all heritable advantages into account, Will might have aspired to marry in his own, if not in a superior rank, but that would have been a violation of principle. He sought a wife in a subordinate department of society; though, in sooth, the woman on whom he fixed his affections was, in point of industrious habits and common-sense, much better than he was. I knew Tibby Tait, a brisk Scottish lass, when she was 'just entered in her teens.' She worked at the loom, and was one of the best cotton-weavers in the town, earning perhaps as much as five-and-twenty shillings a week; for as yet hand-loom weaving had not suffered materially from Cartwright's magnificent invention of the power-loom.

How Tibby should have been put to the unfeminine occupation of weaving, involves some

family details. Her father, Jock, a bulky man of lazy and self-indulgent propensities, had the bad, or probably the good, fortune to be struck with palsy on the left side, which at once furnished him with an unchallengeable excuse for working no more during the rest of his life. As is customary in cases of this sort, the means of livelihood were conveniently thrown on the wife and children. Tibby and her brother were respectively put to a loom in an apartment on the left-hand side of the doorway as you entered the humble dwelling. On the right hand was the kitchen, parlour, bedroom, or whatever you like to call it, where sat Jock, idle and dignifiedly, in an arm-chair at the fire-side, smoking a short black pipe, and complacently surveying his wife, Nelly, a tidy and assiduous being, at her incessant occupation of winding pirns for the weavers in the neighbourhood. As a child dropping in with errands, I received impressions of the scene that remain like a picture photographed on remembrance. The sunlight seems to me still glinting through the window, and falling on Nelly, seated on a 'creepie,' or low stool, birling at her wheel, and mingling with its booming sound the cheerful notes of a song from *The Gentle Shepherd*:

When first my young laddie gae'd to the green hill,  
And I at ewe-milking first sey'd my young skill,  
To bear the milk bowie nae pain was to me,  
When I at the buchtin' forgather'd wi' thee -

which charming lyric she sings in a lightsome way, as a relief to her feelings. From the outer room across the passage, comes the lively clicking noise of shuttles, which, like the booming of Nelly's wheel, imparts a placid satisfaction to Jock, as signifying that all this diligent industry is for his special advantage. The picture includes a member of the establishment, who is about some household work. This was a daughter, Jenny, too young to be set to the loom, and who, meanwhile, fills the situation, without wages, of scout and general factotum. Burns, in his *Cotter's Saturday Night*, speaks of a similarly useful young creature, who

Tentie rins a canny errand to a neebour town.

The errands which Jenny ran were comparatively limited in circuit, but of pretty frequent occurrence, in connection with the supply of her father's indulgences, in which branches of expenditure Nelly and the other bread-winners were excluded from having a voice. Jock permitted no domestic plebiscite in the matter of his personal indulgences.

Viewing his children as so much mechanical and financial capital, Jock was anything but uplifted at the prospect of Tibby making what was thought a good marriage. The happiness of the girl never entered his thoughts. He clearly and logically felt that the loss of his daughter's earnings was plainly an abstraction of so much tobacco, whisky, and other personal solacements. This was of course very shabby and very selfish, but by no means singular. Jock only thought as others think daily. In certain sections of the community, as is well

known, children are valued only according to their contribution to the family earnings; and, like slaves, have no right to remonstrate. He was heard to observe that the taking away of Tibby 'would be a loss o' a red guinea to him every week.' A bereaved slave-owner could not have spoken more feelingly.

Whether Jock liked it or not, the marriage took place. The previous decease of Will's mother and sister happily left the coast clear for Tibby, who, transferred from drudgery at the loom, took her place as the wife of a bonnet laird, for which her education did not exactly qualify her. She had, however, hardly time to settle down in this new phase of life, when Will suddenly took it into his head to sell off the old heritage—land, house, cow, and everything—turn the whole into money, and remove to Penicuik, in order to set up as 'a merchant,' that is to say, to keep a grocer's shop and sell a dram—an occupation for which the Scotch have somehow a remarkable fancy when everything else fails. Tibby was still less qualified to do justice to this kind of business, but, like a dutiful wife, she promised to do her best. Will, at the same time, graciously assuring her that he would take entire charge of the liquor department. So, here they began their mercantile career. The village at the time was crammed with soldiers, stationed as a guard on the mass of French prisoners of war in the depot that I have imperfectly described.

On the occasion of visiting Penicuik, as has been already noticed in these papers, my father and I, after viewing the merry scene of fiddling and dancing among the prisoners, called upon Will, as being in some degree known to him and his wife. The house he occupied is still extant; being the corner building on the right-hand side as you turn into the village on coming from Edinburgh. Conducted up-stairs to an apartment overlooking the wide open space traversed by the thoroughfare southwards, I went, boy-like, to the window, and, glancing out, was startled by observing one of the prisoners in his yellow garb, escorted by a soldier carrying in his hand a drawn bayonet. To add to my surprise, the prisoner and his military escort came to the door of the house in which we were, and immediately there was an announcement that our host was wanted. Off went Will; and all we learned of the affair was that he had dealings with the prisoners, by disposing of some of their articles of manufacture on commission, besides helping them to purchase raw materials as a matter of trade. The circumstance caused us no concern, and only some time afterwards was it abruptly and unpleasantly brought to remembrance.

Early in 1812, paragraphs and advertisements began to appear in the newspapers, to the effect that French prisoners of war in various depots in England and Scotland, were manufacturing and contriving to dispose of forged bank-notes, regarding which people were cautioned to be on their guard. So far as Scotland was concerned, the notes selected for imitation were said to be chiefly those of the Bank of Scotland and the Commercial Bank, because they had little or no pictorial delineation, and consisted almost entirely of engraved penmanship. Furnished with suitable

paper and a few crow-pens, the prisoners at several of the depots produced a fair imitation, sufficient to impose on the unwary. Their chief difficulty consisted in impressing the seal or stamp. Either by cutting a die themselves, or procuring one from artists outside, they impressed it on the paper as is generally believed by the smart blow of a hammer, in the manner that coins long ago had been struck at the Mint. The impression was no doubt deficient, but among an ignorant class of persons that was not noticed. The inhabitants of the town in which we lived were not a little discomposed by the following advertisement in the newspapers, extending over February and March 1812:

'Several forged notes, in imitation of the notes of the Governor and Company of the Bank of Scotland, having appeared chiefly in the neighbourhood of the depots of French prisoners of war, a caution is hereby, on the part of the said Governor and Company, given against receiving such forged notes in payment. And whoever shall, within three months from the date hereof, give such information as shall be found sufficient, on lawful trial, to convict any one concerned in forging or feloniously uttering any of the said notes, shall receive a reward of a hundred pounds sterling. These forged notes are executed by the hand with a pen or pencil, without any engraving. In most of them, the body of the note has the appearance of foreign handwriting. The names of the bank officers are mostly illegible or ill spelled. The ornamented characters and the figures generally ill executed. The seals are very ill imitated. To this mark particular attention is requested.'

For a time, people were puzzled to know how the forged notes in any abundance could get through the cordon of sentinels who night and day environed the palisades of the respective depots. Judicial investigations cleared up the difficulty. From humane considerations, the prisoners had been indulged in a too free communication with the outer world, as regards buying and selling. This degree of liberty they had abused. In the village or town adjoining the depot, they usually found some person willing to receive packets of the notes for disposal on commission, which packets were either smuggled out by the connivance of sentries, or were carried out clandestinely by the prisoners when on a pretended business errand under escort. At Penicuik, a suspicious connection with these transactions fell on that wayward person, our hero, Will; nor did this surprise us, recollecting what we had seen. Summarily, by a warrant of the sheriff of Midlothian, he was captured, and lodged in the Old Tolbooth of Edinburgh. Intelligence of this unforeseen event created, as I recollect, a hubbub in the limited community among whom I resided. Will was known to be heedless, with no end of whimsical notions about social equality, but until now no one fancied he could have anything to do with the circulation of forged bank-notes. The shock to his old acquaintances was correspondingly great.

Things, fortunately, did not turn out so badly as was feared. There was a dash of the comic in the affair. At his judicial examinations, Will professed to know nothing about forged notes. He was a dealer in 'yarn,' on commission. The prisoners made the yarn, and sent him neatly sealed packets of it for disposal. He understood, though he never

got any right explanation on the subject, that by the jocular term 'yarn' was meant pictures to amuse children. Packets containing five of these imaginary pictures were, when he received them, marked 'Small Yarn;' and packets of larger dimensions bore the inscription 'Large Yarn.' He had been in the habit of executing orders for these packages, knowing absolutely nothing of their contents; and it would have been the last of his actions to engage in a traffic of this sort if he had known that the packages contained forged bank-notes. Being pressed to say who were his customers for 'yarn,' he specified one or two persons in Roxburghshire, who were dealers in sheep, cattle, and so on—respectable individuals, as he always believed. The explanations were ingenious. Will was set down as a sort of simpleton. He could not, with a chance of conviction, be charged with a knowledge of 'felonious utterance.' With a strong admonition, he was dismissed. Thankfully he quitted the Tolbooth, after having, in a sense, 'rubbed shoulders wi' the gallows.' What was done with his customers for 'yarn' in Roxburghshire, I never heard with any precision.

Possibly one of them was a man named Alexander Thomson, *alias* John Laurie, who, on a charge of uttering forged notes, was tried before the High Court of Justiciary, 8th September 1812. When apprehended, he was stripped of all his clothing, and a package containing six forged one-pound notes was found concealed between the sole of his foot and his stocking. At his preliminary examinations, he first represented himself to be a drover of cattle, and got the notes at Berwick-on-Tweed. Then, he said he was a soldier in the Aberdeenshire Militia, and that he found the notes near Dalkeith. These prevarications were against him, but at his trial the jury by a plurality of voices found 'the libel not proven.' A narrow escape!

Determined to go to the root of the matter, the authorities instituted a rigorous search of the depot at Penicuik to discover the leading members of the 'yarn-trade.' They alighted upon seven—quite a syndicate. The following particulars regarding the capture and subsequent escape of these alleged forgers are given in the Edinburgh newspapers of July 21, 1812:

'Very early on Sunday morning, seven French prisoners of war, who were committed to the Tolbooth of this city on suspicion of forgery, effected their escape. They were confined to the north-west room on the third story, and they had penetrated the wall, though very thick, till they got into the chimney of Mr Gilmour's shop [on the ground floor], into which they descended by means of ropes. As they could not force their way out of the shop, they ascended a small stair to the room above, from which they took out half of the window, and descended one by one into the street, and got clear off. In the course of the morning, one of them was retaken in the Grass-market, being traced by the sooty marks of his feet. We understand that, except one, they all speak broken English. They left a note on the table of the shop, saying they had taken nothing away.' Their names and a description of their persons were appended. Subsequently, three of the prisoners were taken at Glasgow, and another was apprehended in Dublin. That the government would stop at no half-measures in trying to stamp out the trade of forging notes in the prisons, is

evident from a newspaper notice, April 24, 1812: 'La Roche, the French prisoner of war who was left for execution at Launceston by Sir A. Chambre, was executed on Monday at Bodmin for forging bank-notes. The prisoners in Hamoaze could not be induced to believe he would be executed; much lenity having heretofore been extended to French prisoners who had been detected manufacturing notes. But it is now the determination of government to check the ingenuity of the manufacturers by severe measures.'

As for Will, he had got a fright, and refrained in future from any transactions in 'yarn.' His reputation, however, had suffered, and from this time, his course was rapidly downward. At the peace of 1814, the prisoners departed, and so did the host of soldiers who had watched them, leaving Penicuik almost a 'Deserted Village.' Wrecked and ruined in a business for which he had no capacity, and damaged by his connection with the worst of the *détenus*, he and his family migrated to Edinburgh, where he had ample scope to gravitate to a level with the most abject of the population, and to indulge philosophically in companionship with virtuous rags and wretchedness. And there we leave him. The French prisoners of war gave the finishing blow to his career; but in this respect poor Will was not singular. They were the source of bitter ruin in many quarters—were, in fact, a kind of national pest, certainly a fearful incumbrance. Those on parole, as far as my experience goes, were accomplished, amusing, and orderly in behaviour; but for the most part devoid of any sense of honour as regards incurring or paying debts. It is painful to know, from a Report laid before the House of Commons, that in the years 1810, 1811, and 1812, as many as six hundred and eighty-five French officers and other persons broke their parole, of whom two hundred and forty-two were retaken, and put in confinement. Out of twenty-five French generals, five broke their parole. The Report adds, that 'it is a gratifying circumstance, and a distinguished honour to the British people, that during the war only one Englishman has broken his parole in France, and that one a very young midshipman in the navy, whose advancement in his profession has been terminated in consequence of the act. A contrast more glorious it is scarcely possible to conceive.'

In the condition of those prisoners who patiently kept their parole in the country towns, where they were stationed in parties of from one hundred to two hundred, there was nothing offensive to the feelings. What was truly revolting to every sense of propriety, was the spectacle of vast groups of prisoners—such as three thousand at Penicuik, seven thousand at Perth, ten thousand at Norman Cross, thousands at Dartmoor, and so on—confined like wild beasts for years within palisaded inclosures, and in a state of that utter idleness which led, as we have seen, to criminal acts—forging bank-notes, as it were, to relieve the tedium of their dismal incarceration. In 1811, there were about forty-seven thousand six hundred French prisoners in England, while ten thousand three hundred English languished in the prisons of France. But before the end of hostilities, matters were much worse. At the peace in 1814, the number of French prisoners of war who had to be sent home to their own country amounted to sixty-seven thousand; this being exclusive of some

thousands of Dutch, Danes, and Swiss, who had already been liberated. May we be spared from ever seeing a repetition of this hideous state of things.  
W. C.

### CURIOUS CASE OF STEALING OR NOT STEALING.

In the year 1872, one George Middleton was a depositor in a post-office savings-bank in which a sum of eleven shillings stood at his credit. He duly gave notice to withdraw ten shillings, and a letter of advice was sent to the post-office at Notting Hill, London, to pay Mr Middleton that sum. He presented himself for payment, when the clerk in charge referred by mistake to another letter of advice for eight pounds sixteen shillings and tenpence, and placed the latter sum upon the counter. He entered the amount in the depositor's pass-book, and stamped it, and Mr Middleton walked away with eight pounds six shillings and tenpence which did not belong to him. There is no doubt Mr Middleton was perfectly aware of what he was doing, and of the clerk's mistake, but probably he little thought that it would require the combined intellect and learning of no less than fifteen judges to decide whether or not he stole that money. To an unlearned mind the case presents no difficulty, but it has divided the judicial bench.

Middleton was tried at the Central Criminal Court on the 23d of September 1872, and was found guilty, the learned common-serjeant reserving, for the opinion of the Court for Crown-cases Reserved, the question whether the circumstances amounted in law to a larceny. The latter court met on the 23d of November following, and was composed of five of the judges, under the presidency of Lord Chief-baron Kelly. The court could not agree, and the case was again reserved, this time for the opinion of *all* the judges. On the 25th of January 1873, it was argued by the then Attorney-general, Sir John Coleridge (now the Lord Chief-justice of the Common Pleas), before the Lord Chief-justice of England, the then Lord Chief-justice of the Common Pleas (Sir William Bovill), the Lord Chief-baron, Barons Martin, Bramwell, Pigott, and Cleasby, and Justices Blackburn, Keating, Mellor, Brett, Lush, Grove, Denman, and Archibald—Mr Baron Pollock and Mr Justice Quain being unavoidably absent. In effect, it was argued before the *whole judicial bench of England*. On the 7th of June following, judgment was delivered: Lord Chief-justice Cockburn, and Justices Blackburn, Mellor, Lush, Grove, Denman, and Archibald deciding that Mr Middleton was a thief, upon one ground; Lord Chief-justice Bovill, Lord Chief-baron Kelly, and Mr Justice Keating being of the same opinion, on another ground; Mr Baron Pigott coming to the same conclusion, on a third ground; and Barons Martin, Bramwell, and Cleasby, and Mr Justice Brett, being all four clearly and emphatically of opinion on one and the same ground, that no larceny had been committed.

The case of Middleton is interesting, if only as shewing the scrupulous care with which the English law is administered, and how the ever-varying phenomena of life keep on producing combinations of circumstances that have not occurred, or at anyrate have not been observed, before, and which have to be classified with great travail of mind under some old principle, or else to be

provided for afresh. Mr George Middleton's little adventure at Notting Hill has formed the theme of the most able and elaborate judgments of some of the subtlest legal intellects of our time, extending over thirty-four pages of the law reports, and representing who shall say how much experience, thought, and labour?

The difficulty may be shortly stated. To steal is to take something which belongs to somebody else: but the post-office clerk gave Middleton the money in dispute, and how can a man steal that which is given to him? This may sound like a quibble; but there are noticeable differences between Middleton's proceedings and an ordinary thief's. There is no premeditation, there is no preliminary fraud or trick upon his part; he goes into the post-office with a perfectly innocent intention, and he simply takes what is given to him. He does not walk away with something that is wholly some one else's, but with something that is partly his own. Again, it must always be remembered, judges are not legislators. It is their business to administer the law, and not to make it. They are sworn to give judgment according to precedent. This being so, it having been admitted on all hands that the offence was larceny, if anything, the question was—*not*, ought George Middleton to be punished?—but, did George Middleton's offence against honesty fall within the established definitions of larceny? It was agreed that it was covered by no statute; therefore, if it was a crime at all, it was a crime in contemplation of the common law in the old days when stealing was a hanging matter. The question might then be put thus: in olden time, would Middleton have been hanged for what he did at Notting Hill? A majority of the judges thought he would, but a minority were very positive indeed that he would not. Mr Baron Bramwell vigorously argued, not only that Middleton was not a thief in law, but further, that he was not morally a thief. Admitting that he was a dishonest man, and that what he did ought to be made criminal, the learned baron urged with much force that his unpremeditated act in fraudulently accepting what was given him by mistake, stops short of that deliberate and forcible taking which constitutes theft, and is morally a lesser offence. But of course cases have to be decided by the judges not on principles of morality, but on principles of law, and these remarks are merely incidental to the legal argument.

Before this can be understood, we should premise that, in law, goods are subject to two incidents, property and possession. When my own watch is in my own pocket, property and possession coincide. The property in the watch is in me, and the possession of it is in me. When I lend my watch to you, the possession is in you, but the property remains in me. When I give or sell my watch to you, both the property and possession are transferred to you. Now, when property goes with possession, stealing is out of the question; for the moment the property in the article passes from the original possessor, it ceases to be his, and therefore it cannot be stolen from him. Thus, it is well-settled law, that if a man goes into a provision-shop, and, by falsely pretending he has been sent by a regular customer, obtains a fitch of bacon, which of course he does not pay for, it is not a theft; because the shopkeeper, deceived by the fraud, parts with the property in the fitch as

well as the possession of it. The man obtains the fitch by false pretences, for which he may be punished; but he does not steal it.

The argument may now be understood. Stripped of its technicalities and its allusions to previously decided cases, the judgment of the majority of the judges may be paraphrased as follows: Granted that, if the property in the eight pounds six shillings and tenpence had passed to the prisoner, his offence would not amount to larceny; as a matter of law, the property in that balance did not pass to him, and never vested in him for an instant. True, the possession of it was given to him, but that was only by mistake, and the property in it remained all the time in the Postmaster-general. The money was always some one else's; the prisoner, in taking it, took what did not belong to him, and the guilty intention having been found by the jury as a matter of fact, it is a case of larceny, and the conviction is affirmed. So far, so good; this sounds like common-sense, at all events, and we are not surprised to see attached to it the name of Lord Chief-justice Cockburn. But one side is generally right until the other side is heard; and in this case it is impossible to resist the powerful reasoning of the minority. That, say they in effect, may be common-sense, though we doubt it; but certainly it is not common law, and law is what we are sworn to administer.

The arguments of Mr Baron Bramwell, Mr Justice Brett, and Mr Baron Cleasby make tremendous breaches in the position taken up by the majority; whilst old Baron Martin—brought up in a tough old school, in the days when law *was* law—has hardly patience to argue a point against which his veteran instincts obviously revolt. The reasoning of the minority is, says he, 'unanswered and unanswerable;' and that of the majority appears to the old baron 'worthy of an ancient casuist.' Mr Baron Bramwell is not so outspoken, but is quite as solid. 'Though those whose opinion I share may be, and probably are, in the wrong,' says the polite baron, 'considering the numerous and weighty opinions the other way, there is more doubt in the case than has appeared to some who seem to me to reason thus: The prisoner was as bad as a thief (which I deny), and being as bad, ought to be treated as one (which I deny also).' Mr Justice Brett thinks that the judgment of the majority 'is founded upon and enunciates a wrong proposition of law,' and is of opinion that the prisoner 'could not be convicted according to law.' Mr Baron Cleasby thinks 'the conviction was against law, and ought to be quashed.' They are all four agreed upon the reason why, and argue irresistibly. Starting with the admitted proposition, that to constitute larceny the taking must be against the will, or at least without the will of the owner of the goods, it follows that it is the state of the owner's mind, and not the state of the alleged thief's, that is to be examined for the purpose of determining whether or not the taking was without his will. The guilty intention of the prisoner has therefore nothing to do with the question in dispute. This being cleared away, the question of unwillingness or willingness on the part of the owner is reduced to a question of the condition of the owner's mind, in other words, of his intention. If he intends the property to pass, he is clearly not unwilling that it should; and whether or not

in law it actually does, is immaterial. The question, therefore, is, say the minority, not that which has been put by the majority, namely, did the property pass? but did the clerk intend that it should pass? If he did, it was not taken from him against his will, and was not larceny. Now, did he? Acting under the mistaken impression that he was paying over the correct sum, no doubt he meant the property to pass. Of course he would not have so meant if he had known what he was doing, but as a matter of fact, he did so mean. He clearly did not mean to pay the prisoner ten shillings, because that sum had never suggested itself to his mind; so, if he did not mean to pay him eight pounds sixteen shillings and tenpence, he meant to pay him nothing; which is absurd. The payment, therefore, was a voluntary payment, and its fraudulent acceptance not a theft. Upon these grounds, the minority of the judges thought that the conviction should be quashed; but the majority being of the contrary opinion, it was affirmed. It mattered little to George Middleton what any of them thought, for he had long before served out his sentence, and been set at large.

The following anomaly has thus been added to our law. If Middleton had deliberately concocted a false tale, on the faith of which he had obtained the money, he would only have been guilty of the misdemeanour of obtaining it by false pretences; but because it was accidentally given to him, and he simply walked off with it, he is a felon. The lesser offence is, by this new decision, made the greater. To some minds, the elaborate arguments, of a small part of which the foregoing is the faintest outline, exhausted upon such a question as the guilt of Middleton, may seem to be a piece of mere technical folly; but after all, the only justice that is worth the name is that which is administered on fixed and settled principles. It would never do for judges to make law to suit particular cases; and to strain the law, even to cover obvious injustice and absurdity, is a most dangerous practice. Mr Baron Bramwell evidently thinks his learned brothers have been doing this, and we cannot conclude better than by endorsing his sly recommendation of an article in the *Law Times*, where it is intimated that some judges 'might, with advantage, read and inwardly digest Paley's *Moral and Political Philosophy*, or some other approved treatise, in which the necessity for positive rules of general application, the doctrine of particular and general consequences, and the superior importance of and regard due to general consequences, are clearly expounded.'

## THE FLAG OF DISTRESS.

### CHAPTER IV.—A BLACK SQUALL.

THE surprise caused by the disappearance of the strange vessel is but short-lived. It is explained by a very natural phenomenon—a fog. Not the haze already spoken of; but a dense bank of dark vapour, that, drifting over the surface of the sea, has suddenly enveloped the barque within its floating folds. It threatens to do the same with the frigate, as every sailor aboard of her can perceive. But though their surprise is at an end, a sense of undefined fear still holds possession of them. Nor is this on account of the coming fog.

That could not frighten men who have dared every danger of the deep, and oft groped their way through icy seas shrouded in almost amorphous darkness.

Their fears spring from a fancy that the other phenomena are not natural. The fog of itself may be; but what brings it on—just then, at a crisis, when they were speculating about the character of the chased vessel—some doubting her honesty, others sceptical of her reality, not a few boldly denouncing her as a phantom? If an accident of nature, certainly a remarkable one—in truth, a strange phenomenon.

The reader may smile at credulity of this kind; but not he who has mixed among the men of the fore-castle, whatever the nationality of the ship, and whether merchantman or man-of-war. Not all the training of naval schools, nor the boasted enlightenment of this our age, has fully eradicated from the mind of the canvas-clad mariner a belief in something more than he has seen, or can see—something outside nature. To suppose him emancipated from this would be to hold him of higher intelligence than his fellow-men, who stay ashore ploughing the soil, as he does the sea. To thousands of these he can point, saying: 'Behold the believers in supernatural existences—in spirit-rappings—ay, in very ghosts; this not only in days gone by, but now—now more than ever within memory of man!' Then let not landmen scoff at such fancies, not a whit more absurd than their own credulous conceits.

Aside from this sort of feeling in the war-ship, there is soon a real and far more serious apprehension, in which all have a share, officers as well as men. A fog is before their eyes—apparently fast approaching. It has curtailed the other vessel, spreading over her like a pall, and threatens to do the same with their own. They perceive, also, that it is not a fog of the ordinary kind, but one that portends storm, sudden and violent. For they are threatened by the *black squall* of the Pacific. Enough in the name to cause uneasiness about the safety of their ship; though not of her are they thinking. She is a staunch vessel, and can stand the sea's buffetings. Their anxiety is for their absent shipmates, whose peril all comprehend. They know the danger of the two vessels getting separated in a fog. If they do, what will be the fate of those who have staid behind on the barque? The strange craft has been signalling distress. Is it scarcity of provisions, or the want of water? If so, in either case she will be worse off than ever. It cannot be shortness of hands to work her sails, with these all set! Sickness, then? Some scourge afflicting her crew—cholera or yellow fever? This made probable, by the lieutenant sending back for the doctor—and the doctor only.

Conjecturing ends, and suddenly. The time for action has arrived. The dark cloud comes driving on, and is soon around the ship, lapping her in its damp murky embrace. It clings to her bulwarks, pours over her canvas still spread, wetting it till

big drops rain down upon the deck. It is no longer a question of the surgeon starting forth on his errand of humanity, nor the cutter returning to the becalmed barque. Now there is no more chance of discovering the latter, than of finding a needle in a truss of straw. In such a fog, the finest ship that ever sailed sea, with the smartest crew that ever manned vessel, would be helpless as a man groping his way in Cimmerian darkness. There is no more thought of the barque, and not so much about the absent officers. Out of sight, they are for a time almost out of mind. For on board the frigate every one has now enough to do looking after himself and his duties. Almost on the instant of her sails being enveloped in vapour, they are struck by a wind coming from a quarter directly opposite to that for which they have been hitherto set.

The voice of her commander, heard thundering through a trumpet, directs canvas to be instantly taken in. The order is executed with the promptness peculiar to men-of-war's men; and soon after, the huge ship is tossing amid tempestuous waves, with only storm-sails set. A ship under storm-canvas is a sight always melancholy to the mariner. It tells of a struggle with winds and waves, a serious conflict with the elements, which may well cause anxiety.

Such is the situation of the British frigate, soon as surrounded by the fog. The sea, lately tranquil, is now madly raging; the waves tempest-lashed, their crests like the manes of white horses in headlong gallop. Amid them the huge war-vessel, but a while before almost motionless, a leviathan, apparently the sea's lord, is now its slave, and soon may be its victim. Dancing like a cork, she is buffeted from billow to billow, or thrown into the troughs between, as if cast there in scorn. Her crew is fully occupied taking care of her, without thought of any other vessel—even one flying a flag of distress. Erelong they may have to hoist the same signal themselves. But there are skilled seamen aboard, who well know what to do—who watch and ward every sea that comes sweeping along. Some of these tumble the big ship about till the steersmen feel her going almost regardless of the rudder.

There are but two courses left for safety, and her captain weighs the choice between them. He must 'lie to,' and ride out the gale, or 'scud' before it. To do the latter might take him away from the strange vessel—now no longer seen—and she might never be sighted by them again. Ten chances to one if she ever would, for *she* may not elect to run down the wind. Even if she did, there would be but slight hope of overhauling her, supposing the storm to continue for any considerable time. The probabilities are that she will lie to. As the frigate's lieutenant will no doubt have control, he will order her sails to be taken in; he would scarce think of parting from that spot.

Thus reflecting, the captain determines to stay

where he is. Everything has been made snug, and the ship's head set close to wind.

Still, aboard of her, brave hearts are filled with sad forebodings; not from any fear for themselves, but the safety of their shipmates in the barque. Both of the absent officers are favourites with their comrades of the quarter, as with the crew. So too the coxswain who accompanies them. What will be their fate? All are thinking of it, though no one offers a surmise. No one can tell to what they have committed themselves. 'Tis only sure, that in the tempest now raging there must be danger to the strange craft, without counting that signalled by her reversed ensign—without thought of the mystery already enwrapping her. The heart of every man on board the war-ship is beating with humanity, and pulsing with pent-up fear. And while the waves are fiercely assaulting the strong ship—while winds are rattling loud amidst her rigging—a yet louder sound mingles with their monotone. It is given out at regularly measured intervals: for it is the *minute-gun* which the frigate has commenced firing—not as a signal of distress, asking for assistance, but one of counsel and cheer, seeking to give it. Every sixty seconds, amidst the wild surging of waves, and the hoarse howling of winds, the louder boom of cannon breaks their harsh continuity.

The night comes down, adding to the darkness, though not much to the dilemma in which the frigate is placed. The fog and storm combined have already made her situation dangerous as might be; it could not well be worse. Both continue throughout the night; and on through all the night she keeps discharging the signal-guns. No one aboard of her thinks of listening for a response. In all probability, there is no cannon—nothing upon the barque that could give it. Close upon the hour of morning, the storm begins to abate, and the clouds to dissipate. The fog seems to be lifting, or drifting off to some other part of the ocean. With hope again dawning comes the dawn of day. The crew of the frigate every man of them, officers and tars—are upon deck. They stand along the ship's sides, ranged in rows by the bulwarks, looking out across the sea.

There is no fog now—not the thinnest film. The sky is clear as crystal, and blue as a boat-race ribbon fresh unfolded; the sea the same—its big waves no longer shewing sharp white crests, but rounded and rolling gently along. Over these the sailors look, scanning the surface. Their gaze is sent to every quarter—every point of the compass. The officers sweep the horizon with their glasses, ranging around the circle where the two blues meet. But neither naked eye nor telescope can discover aught there. Only sea and sky; an albatross with pinions of grander spread; or a tropic bird, its long tail-feathers trailing, train-like, behind it. No barque, polacca-rigged or otherwise—no ship of any kind—no sign of sail—no canvas except a full set of 'courses' which the frigate herself has now set. She is alone upon the ocean—in the mighty Pacific—a mere speck upon its far-stretching illimitable expanse. Every man aboard of her feels this, and feels it with a sense of sadness. But they are silent, each inquiring of himself what has become of the barque, and what has become of the fate of their shipmates.

One alone is heard speaking aloud, giving

expression to a thought now common to all. It is the sailor who twice uttered the prediction, which he again repeats—only changing it to the assertion of a certainty. With a group gathered around him, he says: 'Shipmates; we'll never see that lieutenant again, nor the young reefer, nor the old cox'n—never!'

#### CHAPTER V.—A BRACE OF BRITISH OFFICERS.

Scene, San Francisco, the capital of California. Time, the autumn of 1849; several weeks antecedent to the chase described.

A singular city the San Francisco of 1849; very different from what it is to-day, and equally unlike what it was twelve months before the aforesaid date; when the obscure village of Yerba Buena yielded up its name, along with its site, entering on what may be termed a second genesis.

The little village, port of the Mission Dolores, built of sun-dried bricks—its petty commerce in hides and tallow represented by two or three small craft annually visiting it—wakes up one morning to behold whole fleets of ships come crowding through the Golden Gate, and dropping their anchor in front of its wharfed strand. They come from all parts of the Pacific, from all the other oceans, from the ends of the earth, carrying every kind of flag known to the nations. The whaler, late harpooning 'fish' in the Arctic, with him who has been chasing 'cachalot' in the Pacific and Indian; the merchantman standing towards Australia, China, or Japan; the trader among the South Sea Islands; the coaster of Mexico, Chili, and Peru; men-of-war of every flag and fashion—frigates, corvettes, and double-deckers; even Chinese junks and Malayan prahus are seen sailing into San Francisco Bay, and coming to beside the beach of Yerba Buena.

What has caused this grand spreading of canvas, and commingling of queer craft? What is still causing it, for still they come! The answer lies in a little word of four letters; the same that from the beginning of man's activity on earth has moved him to many things, too oft to deeds of evil—*gold*. Some eighteen months before, the Swiss *émigré* Sutter, scouring out his mill-race on a tributary of the Sacramento River, observes shining particles among the mud. Taking them up, and holding them in the hollow of his hand, he feels that they are heavy, and sees them to be of golden sheen. And gold they prove, when submitted to the test of the alembic. The son of Helvetia discovers the precious metal in grains and nuggets, interspersed with the silt of a fluvial deposit. They are not the first found in California, but the first coming under the eyes of Saxon settlers—men imbued with the energy to collect and carry them to the far-off outside world.

Less than two years have elapsed since the digging of Sutter's mill-race. Meantime, the specks that scintillated in its ooze have been transported over the ocean, and exhibited in the great cities—in the windows of brokers and bullion-merchants. The sight has proved sufficient to thicken people the banks of the Sacramento—hitherto sparsely settled—and cover San Francisco Bay with ships from every quarter of the globe. Not only is the harbour of Yerba Buena crowded with strange craft, but its streets with queer characters—adventurers of every race and clime—among whom may

be heard an exchange of tongues, the like never listened to since the abortive attempt at building the tower of Babel. The Mexican mud-walled dwellings disappear; swallowed up and lost amidst the modern surrounding of canvas tents, and weather-board houses, that have risen as by magic around them. A like change has taken place in their occupancy. No longer the tranquil interiors—the *tertulia*, with guests sipping aniseed, curaçoa, and Canario—munching sweet cakes and *confituras*. Instead, the houses inside now ring with boisterous revelry, smelling of mint and Monongahela; and, though the guitar still tinkles, it is almost inaudible amid the louder strains of clarionet, fiddle, and trombone.

What a change in the traffic of the streets! No more silent at certain hours deserted for the *siesta*; at others, trodden by sandalled monks and shovel-hatted priests—both bold of gaze, when passing the dark-eyed damsels in high shell-combs and black silk mantillas; bolder still, saluting the brown-skinned daughter of the aboriginal wrapped in her blue-gray *rebozo*. Trodden, too, by garrison soldiers in uniforms of French cut and colour; by officer glittering in gold lace; by townsman in cloak of broadcloth; the country gentleman (*haciendado*) on horseback; and the herdsmen, or small farmers (*rancheros*), in their splendid Californian costume. Some of these are still seen, but not as of yore, swaggering and conspicuous. Amid the concourse of new-comers they move timidly; jostled by rough men in red flannel shirts, buckskin and blanket coats, with pistols in their belts, and knives hanging handy along their hips. Others equally formidable in Guernsey frocks, or wearing the dreadnought jacket of the sailor; not a few scarcely clothed at all, shrouding their nakedness in such rags as remain after a long journey overland, or a longer voyage by sea. In all probability, since its beginning, the world never witnessed so motley an assemblage of men tramping through the streets of a seaport town as those seen in Yerba Buena, just baptised San Francisco, 1849 A.D. And perhaps never a more varied display of bunting in one bay.

In all certainty, harbour never had so large a number of ships with so few men to man them. At least one-half are crewless, and a large proportion of the remainder nearly so. Many have but their captain and mates, with, it may be, the carpenter and cook. The sailors are ashore, and but few of them intend returning aboard. They have either gone off to the gold-diggings, or are going. There has been a general *débandade* among the Jack-tars—leaving many a merry fore-castle in forlorn and silent solitude.

In this respect, there is a striking contrast between the streets of the town and the ships in its harbour. In the former, an eager throng, pushing, jostling, surging noisily along, with all the impatience of men half-mad; in the latter, tranquillity, inaction, the torpor of lazy life, as if the ships—many of them splendid craft—were but hulks laid up for good, and never again going to sea. Some never did. Yet not all the vessels in San Francisco Bay are crewless. A few still have their complement of hands—these being mostly men-of-war. The strict naval discipline prevents desertion, though it needs strategy to assist. They ride at anchor far out beyond swimming distance from the beach, and will not allow shore-boats to

approach them. The tar who attempts to take French leave, will have a severe swim for it; and perchance get a shot which will send him to the bottom of the sea. With this menace constantly before his mind, even California's gold does not tempt him to run the gantlet.

Among the craft keeping up this iron discipline is one that bears the British flag—a man-of-war, conspicuous by her handsome hull and clean tapering spars. Her sails are stowed snug, lashed neatly along the yards; in her rigging not a rope out of place. Down upon her decks, white as holystone can make them, the same regularity is observable. Every rope is coiled or trimly turned upon its belaying-pin. It could not be otherwise with the frigate *Crusader*, commanded by Captain Bracebridge, a sailor of the old school, who takes a pride in his ship. He still retains his crew—every one of them. There is not a name on the frigate's books but has its representative in a live sailor, who can either be seen upon her decks, or at any moment summoned thither by the whistle of the boatswain. Though even if left to themselves, but few of them would care to desert; gold itself cannot lure them to leave a ship where things are so agreeable; for Captain Bracebridge does all in his power to make matters pleasant, for men as well as officers. He takes care that the former get good grub, and plenty of it, including full rations of grog. He permits them to have amusements among themselves; while the officers treat them to *tableaux-vivants*, charades, and private theatricals. To crown all, a grand ball has been given aboard the ship, in anticipation of her departure from the port—an event near at hand. This, in return for an entertainment of like kind, given by some citizens in honour of her officers; at which more than one of the latter made acquaintances they would wish to meet again two of them desiring it with longings of a special kind. In other words, two of the frigate's officers have fallen in love with a brace of shore damsels, with whom they have danced, and done some flitting.

It is the third day after the ball, and these two officers are standing upon the poop-deck, conversing about it. They are apart from their comrades—purposely, since their speech is confidential. They are both young men; the elder of them, Crozier, being a year or two over twenty; while the younger, Cadwallader, is almost as much under it. Crozier has passed his term of probationary service, and is now a 'mate;' while the other is still a 'midshipmite.' And a type of this last, just as Marryat would have made him, is Willie Cadwallader; bright face, light-coloured hair, curling over cheeks ruddy as the bloom upon a ripe peach. He is Welsh, with those eyes of turquoise blue often observed in the descendants of the *Cymri*; and hair of a hue seen nowhere else—threads of gold commingled with tissue of silver.

Quite different is Edward Crozier, who hails from an ancestral hall standing in the shire of Salop. His hair, also curling, is dark brown. His complexion corresponding, and a pair of moustaches, already well grown, lie like leeches along his lip, the tips turned upward. An aquiline nose and broad jaw-blades denote resolution a character borne out by the glance of an eye that never shews quailing. He is of medium size, with a figure denoting great strength, and capable of

carrying out any resolve his mind may make; the shoulders square-set, breast well bowed out, the arms and limbs in perfect proportion. In point of personal appearance, he is the superior; though both are handsome fellows, each in his own style. And as the styles are different, so are their dispositions—these rather contrasting. Crozier is of a serious, sedate turn; and, though anything but morose, rarely given to mirth. From the face of Cadwallader the laugh is scarcely ever absent, and the dimple on his cheek—to employ a printer's phrase—appears stereotyped. With the young Welshman a joke might be carried to extremes, but he would only seek his *revanche* by a lark of like kind. With him of Salop, practical jesting would be dangerous, and might end in stern resentment—perhaps in a duel. Notwithstanding this difference of disposition, the two are fast friends; a fact perhaps due to the dissimilitude of their natures. When not separated by their respective duties, they keep together aboard ship, and together go ashore; and now, for the first time in the lives of both, have commenced making love together. Fortune has favoured them in this: that they are not in love with the same lady. Still further, that their sweethearts do not dwell apart, but live under one roof, and belong to one family. They are not sisters, for all that; nor yet cousins, though standing in a certain relationship. One is the aunt of the other. Such kinship might augur inequality in their age. There is none, however, or only a very little. Not so much as between the young officers themselves. The aunt is but a year, or so, the senior of her niece. And as Fate has willed, the lots of the lovers have been cast in the proper symmetry and proportion. Crozier is in love with the former—Cadwallader with the latter.

Their sweethearts are both Spanish, of the purest blood, the boasted *sangre azul*. They are respectively daughter and grand-daughter of Don Gregorio Montijo, whose house can be seen from the ship: a mansion of imposing appearance, in the Mexican *hacienda* style, standing upon the summit of a hill, at some distance ashore, and southward from the town. While conversing, the young officers have their eyes upon it—one of the two assisting his vision with a binocular. It is Cadwallader who uses the instrument.

Holding it to his eye, he says: 'I think I can see them, Ned. At all events, there are two heads on the house-top, just shewing over the parapet. I'll take odds it's them, the dear girls. I wonder if they see us?'

'Not unless, like yourself, they are provided with telescopes.'

'By Jove! I believe they've got them. I see something that glances in the hands of one; my léz, I'll warrant.'

'More likely it's my Carmen. Give me the glass. For all those blue eyes you're so proud of, I can sight a sail farther than you.'

'A sail, yes; but not a pretty face, Ned. No, no; you're blind to beauty, else you'd never have taken on to that old aunt, leaving the niece to me. Ha, ha, ha!'

'Old, indeed! She's as young as yours, if not younger. One tress of her bright amber hair is worth a whole head of your sweetheart's black stuff. Look at this!' Crozier draws out a lock of hair, and unfolding, shakes it tauntingly before

the other's eyes. In the sun it gleams golden, with a radiance of red; for it is amber, as he has styled it.

'Look at this!' cries Cadwallader, also exhibiting a tress. 'You thought nobody but yourself could show love-locks. There's a bit of hair, that to yours, is as costly silk alongside cheap common cotton.'

For an instant each stands caressing his particular tress, then both burst into laughter, as they stow away their separate favours.

Crozier, in turn taking the binocular, directs it on the house of Don Gregorio; after a time saying: 'About one thing you're right, Will: those heads are the same from which we've got our love-locks. Ay, and they're looking this way, through glasses. They'll be expecting us soon. Well; we'll be with them, please God, before many minutes. Then, you'll see how much superior bright amber is to dull black—anywhere in the world, but especially in the light of a Californian sun.'

'Nowhere, under either sun or moon. Give me the girl with the raven hair!'

'For me, her with the golden bronze!'

'Well; *cada uno a su gusto* [every one to his liking], as my sweetheart has taught me to say in her soft Andalusian. But now, Ned; talking seriously, do you think the governor will allow us to go ashore?'

'He must, and I know he will.'

'How do you know it?'

'Bah! *ma bohil*, as our Irish second would say. You're the son of a poor Welsh squire—good blood, I admit. But I chance to be heir to twice ten thousand a year, with an uncle in the Admiralty. I have asked leave for both of us. So, don't be uneasy about our getting it. Captain Bracebridge is no snob; but he knows his own interests, and won't refuse our fair request. See! There he is—coming this way. Now for his answer—affirmative, you may rely upon it.'

'Gentlemen,' says the captain, approaching, 'I give you leave to go ashore for the day. The gig will take you, landing wherever you wish. You are to send the boat back, and give the coxswain orders where, and when, he's to await you on your return to the ship. Take my advice, and abstain from drink, which might get you into difficulties. As you know, just now San Francisco is full of all sorts of queer characters—a very Pandemonium of a place. For the sake of the service, and the honour of the uniform you wear, steer clear of scrapes—and above all, give a wide berth to women.'

After thus delivering himself, the captain turns on his heel, and retires—leaving the young officers to their meditations. They do not meditate long; the desired leave has been granted, and the order given for the gig to be got ready. The boat is in the water, her crew swarming over the side, and seating themselves upon the thwarts. The young officers only stay to give a finishing touch to their toilet, preparatory to appearing before eyes, of whose critical glances both have more fear than they would the fire from a broadside of great guns. This arranged, they drop down the man-ropes, and seat themselves in the stern-sheets; Crozier commanding the men to shove off. Soon the frigate's gig is gliding over the tranquil waters of San Francisco Bay; not in the direction of the landing-wharf, but towards a point on the shore, to the south of, and some distance outside

the suburbs of the city. For, the beacon towards which they steer is the house of Don Gregorio Montijo.

#### CHAPTER VI.—A PAIR OF SPANISH SEÑORITAS.

Don Gregorio Montijo is a Spaniard, who, some ten years previous to the time of which we write, found his way into the republic of Mexico; afterwards moving on to 'Alta California.' Settling by San Francisco Bay, he became a stock-farmer—the industry in those days chiefly followed by Californians. His grazing estate gives proof that he has prospered. Its territory extends several miles along the bay, and several leagues backward, its boundary in this direction being the shore of the South Sea itself; while a thousand head of horses, and ten times the number of horned cattle, roam over its rich pastures. His house stands upon the summit of a hill that rises above the bay—a sort of spur projected from higher ground behind, and trending at right angles to the beach, where it declines into a low-lying sand-spit. Across this runs the shore road, southward from the city to San José, cutting the ridge midway between the walls of the house and the water's edge, at some three hundred yards' distance from each.

The dwelling, a massive quadrangular structure—in that semi-moriscan style of architecture imported into New Spain by the Conquistadores—is but a single story in height, having a flat terraced roof, and an inner court, approached through a grand gate entrance, centrally set in the front façade, with a double-winged door wide enough to admit the chariot of Sir Charles Grandison.

Around a Californian country-house there is rarely much in the way of ornamental grounds—even though it be a *hacienda* of the first class. And when the headquarters of a grazing estate, still less; its inclosures consisting chiefly of 'corrals' for the penning and branding of cattle, usually erected in the rear of the dwelling. To this almost universal nakedness the grounds of Don Gregorio offer some exception. He has added a fence, which, separating them from the high-road, is penetrated by a portalled entrance, with an avenue that leads straight up to the house. This, strewn with snow-white sea-shells, is flanked on each side by a row of *manzanita* bushes—a beautiful indigenous evergreen. Here and there, a clump of California bays, and some scattered peach-trees, shew an attempt, however slight, at landscape gardening.

Taking into account the grandeur of his house, and the broad acres attached to it, one may well say, that in the New World Don Gregorio has done well. And, in truth, so has he—thriven to fullness. But he came not empty from the Old; having brought with him sufficient cash to purchase a large tract of land, as also the horses and horned cattle with which to stock it. No needy adventurer he, but a gentleman by birth; one of Biscay's bluest blood—hidalgos since the days of the Cid.

In addition to his ready-money, he also brought with him a wife—Biscayan as himself—and a daughter, who at the time was but a child. His wife has been long ago buried; a tombstone in the cemetery of the old Dolores Mission commemorating her many virtues. Since, he has had an accession to his contracted family circle; the added member being a grand-daughter, only a year younger than

his daughter, but equally well grown—both having reached the ripest age of girlhood. It is not necessary to say that these young ladies, thus standing in the relationship of aunt and niece, are the two with whom Edward Crozier and Willie Cadwallader have respectively fallen in love.

While these young officers are on the way to pay them the promised visit, a word may be said about their personal appearance. Though so closely allied, and nearly of an age, in other respects the two girls differ so widely, that one unacquainted with the fact would not suspect the slightest kinship between them.

The aunt, Doña Carmen, is of pure Biscayan blood, both by her father's and mother's side. From this she derives her blonde complexion, with that colour of hair so pleasing to the sight of Edward Crozier; with blue-gray eyes, known as 'Irish'—the Basques and Celts being a kindred race. From it, also, she inherits a cheerful smiling countenance, with just enough of roguery in the smile to cause a *soupeçon* of coquettishness. Her Biscayan origin has endowed her with a figure of fine full development, withal in perfect feminine proportion; while her mother has transmitted to her what, in an eminent degree, she herself possessed—facial beauty.

In the daughter its quality has not deteriorated, but perhaps improved. For the benignant clime of California has this effect; the soft breezes of the South Sea fanning as fair cheeks as were ever kissed by Tuscan or Levantine wind. It is not necessary to describe Doña Carmen Montijo in detail. A chapter might be devoted to her many charms, and still not do them justice. Enough to say that they are beyond cavil; and that there are men in San Francisco who would dare death for her sake, if sure of a smile from her to shew approval of the deed. Ay, one who would for as much do murder. And in that same city is one who would do the same for her niece—Inez Alvarez; though she has neither a blonde complexion, blue eyes, nor amber-coloured hair. In all three different; the first being *morena*, or brunette; the second, black as jet; the last, as raven's plumes. But she has also beauty, of the type immortalised by many bards—Byron among the number, when he wrote his rhapsody on the 'Girl of Cadiz.'

Inez is herself a girl of Cadiz, of which city her father was a native. The Condé Alvarez, an officer in the Spanish army, serving with his regiment in Biscay, there saw a face that charmed him. It belonged to the daughter of Don Gregorio Montijo—his eldest and first-born, some eighteen years antecedent to the birth of Carmen, his last. The count wooed the Biscayan lady; won, and bore her away to his home in Andalusia. Both he and she have gone to their long account, leaving their only child, Inez, inheritress of a handsome estate. From her father, in whose veins ran Moorish blood, she inherits her jet-black eyes, having lashes nearly half an inch in length, and above them, brows shaped like the moon in the middle of her first quarter. Though in figure more slender than her aunt, she is quite Carmen's equal in height; and in this may yet excel, since she has not yet attained her full stature. The death of her parents accounts for her being in California; whither she has come to be under the protection of the father of her mother. She has been there but a

short time; and although all the while 'lovers have been sighing around her,' she longs to return to her own Andalusia.

As already said, Don Gregorio's dwelling is flat-roofed, its top, in Spano-Mexican phrase, termed the *azotea*. This surrounded by a parapet breast-high, is beset with plants and flowers in boxes and pots, thus forming a sort of aerial garden, reached by a stone stair—the *escalera*—which leads up out of the inner court, called *patio*. During certain hours of the day, the *azotea* is a favourite resort, being a pleasant place of dalliance, as also the finest for observation—commanding, as it does, a view of the country at back, and the broad bay in front. To look upon the last have the two 'señoritas,' on this same morning, ascended—soon after breakfast, in all parts of Spanish America partaken at the somewhat late hour of 11 A.M.

That they do not intend staying there long, is evident from the character of their dresses. Both are costumed and equipped for the saddle; having hats of vicuña wool on their heads, riding-whips in their hands, and spurs on their heels; while in the courtyard below stand four horses, saddled and bridled, champing their bits, and impatiently striking the pavement with their hoofs. Since all the saddles are such as should be ridden by men, it may be supposed only men are to be mounted, and that the ladies' horses have not yet been brought out of the stable. This would naturally be the conjecture of a stranger to Spanish California. But one *au fait* to its fashions would draw his deductions differently. Looking at the spurred damsels upon the house-top, and the saddled horses below, he would conclude that at least two of the latter were intended to be ridden by the former; in that style of equitation with which the famed Duchesse de Berri was accustomed to astonish the people of Paris. The other two horses, having larger and somewhat coarser saddles, are evidently designed for gentlemen; so that the cavalcade will be symmetrically composed—two and two of each sex. The gentlemen have not yet put in an appearance; but who they are may be learnt by listening to the dialogue passing between the two señoritas. From their elevated position they can see the rapidly growing city of San Francisco, and the shipping in its harbour. This is north-east, and a little to their left. But there are several vessels riding at anchor just out in front of them. One, a war-ship, towards which the eyes of both keep continuously turning, as though in expectation to see a boat put off from her side. As yet none such has been seen; and, withdrawing her gaze from the war-ship, Inez opens the conversation by asking her aunt a question: 'Is it really true that we're going back to Spain?'

'Quite true; and I'm sorry for it.'

'Why should you be sorry?'

'Why! There are many reasons.'

'Give one!' challenges the niece.

'I could give twenty.'

'One will be sufficient—if good.'

'They're all good,' gravely rejoins the aunt.

'Let me hear them, then.'

'First of all, I like California—I love it, its fine climate, and bright blue skies.'

'Not a bit brighter, or bluer, than those of Spain.'

'Ten times brighter, and ten times bluer. The

skies of the Old World are to those of the New as lead to *lapis lazuli*. In that respect, neither Spain nor Italy can compare with California. Its seas, too, are superior. Even the boasted Bay of Naples would be but a little lake alongside this noble sheet of water, far stretching before our eyes. Look at it !

'Looking at it through *your* eyes, I might think so—not through mine. For my part, I see nothing in it to be so much admired.'

'But something *on* it ; for instance, that grand ship out yonder. Come, now, confess the truth ! Isn't that something to admire ?'

'But that does not belong to the Bay,' replies the Andalusian.

'No matter ; it's on it now, and in it—the ship, I mean, somebody who, if I mistake not, has very much interested somebody else—a certain Andalusian damsel, by name *Iñez Alvarez*.'

'Your words will answer as well for a Biscayan damsel, by name *Carmen Montijo*.'

'Suppose I admit it, and say yes ? Well ; I will. There *is* one in yonder ship who has very much interested me. Nay, more ; I admire, ay, love him ! You see I'm not ashamed to confess what the world seems to consider a woman's weakness. We Biscayans don't keep secrets as you Andalusians. For all, *sobrina*, you haven't kept yours, though you tried hard enough. I saw from the first you were smitten with that young English officer who has hair the exact colour of a fox squirrel.'

'It isn't anything of the kind. His hair is a thousand times of a prettier hue than that of the other English officer, who's taken your fancy, *tia*.'

'Nothing to compare with it. Look at this. There's a curl, one of the handsomest that ever grew on the head of man ! Dark and glossy, like the coat of a fur-seal. Beautiful ! I could kiss it over and over again !'

While speaking, she does so.

'And look at this !' cries the other, also drawing forth a lock of hair, and displaying it in the sunlight. 'See how it shines like tissue of gold ! Far prettier than that you've got, and better worth kissing.'

Saying which she imitates the example her aunt has set her, by raising the tress to her lips, and repeatedly kissing it.

'So, so, my innocent !' exclaims *Carmen*, 'you've been stealing too ?'

'As yourself.'

'And I suppose you've given him a love-lock in exchange ?'

'Have you ?'

'I have. To you, *Iñez*, I make no secret of it. Come, now ! Be equally candid with me. Have you done so ?'

'I've done the same as yourself.'

'And has your heart gone with the gift ? Tell the truth, *sobrina*.'

'Ask your own, *tia* ; and take its answer for mine.'

'Enough, then ; we understand each other, and shall keep the secret to ourselves. Now, let's talk of other things ; go back to what we began with—about leaving California. You're glad we're going ?'

'Indeed, yes. And I wonder you're not the same. Dear old Spain, the finest country on earth ; and Cadiz the finest city.'

'Well ; *cada uno a su gusto* [every one to his liking]. But about that we two differ. Give me California for a country, and San Francisco for a home ; though it's not much of a city yet. It will be, ere long ; and I should like to stay in it. But that's not to be, and there's an end of it. Father has determined on leaving. Indeed, he has already sold out ; so that this house and the lands around it are no longer ours. As the lawyers have made out the deed of transfer, and the money has been paid down, we're only here on sufferance, and must soon yield possession. Then, we're to take ship for Panama, go across the Isthmus, and over the Atlantic Ocean ; once more to renew the Old-world life, with all its stupid ceremonies. Oh ! I shall sadly miss the free wild ways of California—its rural sports—with their quaint originality and picturesqueness. I'm sure I shall die of *ennui*, soon after reaching Spain. Your Cadiz will kill me.'

'But, *Carmen* ; surely you can't be happy here—now that everything is so changed ? Why, we can scarcely walk out in safety, or take a promenade through the streets of the town, crowded with those rude fellows in red shirts, who've come to search for gold—Anglo-Saxons, as they call themselves.'

'What ? You speaking against Anglo-Saxons ! And with that tress treasured in your bosom—so close to your heart !'

'Oh ! *he* is different. He's not Saxon, but Celtic, the same as you Biscayans. Besides, he isn't to be ranked with that rabble, even though he were of the same race. The *Señor Cadwallader* is a born *hidalgo*.'

'Admitting him to be, I think you do wrong to these red-shirted gentry, in calling them a rabble. Rough as is their exterior, they have gentle hearts under their coarse homespun coats. Many of them are true bred and born gentlemen ; and, what's better, behave as such. I've never received insult from them—not even disrespect, though I've been beside them scores of times. Father wrongs them too : for it is partly their presence here that's causing him to leave California, as so also many others of our old families. Still, as we reside in the country, at a safe distance from town, we might enjoy immunity from meeting *los barbaros*, as our people are pleased contemptuously to style them. For my part, I love dear old California, and will greatly regret leaving it. Only to think ; I shall never more behold the gallant *vagüero*, mounted on his magnificent steed, careering across the plain, and launching his lazo over the horns of a fierce wild bull, ready to gore him if he but miss his aim. Ah ! it's one of the finest sights in the world—so exciting in this dull, prosaic age. It recalls the heroic days and deeds of the Great Condé, the Campeador, and Cid. Yes, *Iñez* ; only in this modern Transatlantic land—out here, on the shores of the South Sea—do there still exist customs and manners to remind one of the old knight-errantry and times of the troubadours.'

'What an enthusiast you are ! But apropos of your knights-errant, yonder are two of them—if I mistake not, making this way. Now, fancy yourself on the donjon of an ancient Moorish castle, salute, and receive them accordingly. Ha, ha, ha !'

The clear ringing laugh of the Andalusian is not echoed by the Biscayan. Instead, a shadow steals

over her face, as her eyes become fixed upon two figures distinguishable as men on horseback.

'True types of your Californian *chivalry*!' adds Iñez ironically.

'True types of Californian *villainy*!' rejoins Carmen, in earnest.

### SUMMER BY THE NORMAN SEA-SIDE.

THE Norman sea-side is perhaps the most delightful in all France; and it is the easiest of access from England; yet many a summer day may be passed among its fishing hamlets, and even its watering-places, without sight of any except a few strangers, who prefer the by-ways to the highways of pleasure. Others there are—no doubt constituting the vast majority—who swarm every season to the sands and baths of Havre, where French and English alike enjoy the bustle and breeze of the jetty, the gaieties of Frascati, and the lounge along the bay, which curves gracefully as far as Saint-Adresse; and some even push their rambles as far as that charming village, on a pilgrimage to the tomb of Talma's daughter, the hermitage of Alphonse Karr, and the ruins of the bandit 'Blackskin's' castle, now surrounded by an innocent farmyard. Of these, a proportion advance still farther to Cape de la Heve, with its two lighthouses, its terrible cliffs, and its Shrine of the Royal Shoe, where the water, apostrophised by Georges Sand, is supposed to be deeper than at any other point of the coast. In other directions, a sprinkling of visitors is attracted to Leure, by the beauty of its flowers and the abundance of its sea-fowl.

You may spend long afternoons in succession in or about Harfleur, once 'the sovereign port of Normandy,' and see none but the inhabitants: no ships are at anchor there; only a few fishing-boats lie moored to the green and slimy piles; the streets of 'the Norman Carlhage' are nearly deserted; the bells in the tower, that formerly sounded a hundred and one strokes every morning, in honour of the town, are silent; the old bridge is rotting into the blackened water; all is lifeless and decaying. It is very much the same with Honfleur, though this is still, in these midsummer days, a place of Norman resort, notwithstanding its muddy beach, washed by yellow waves, for the sake of the wonderful picture of land and water, painted in all colours, below its wood-crested rocks. This is the Normandy of Normandy. A town more mediæval and melancholy of aspect I have never seen. Not so 'Little Orcher,' with its orchards of apples, yielding sweet cider, or 'royal sirop of apples, antidote against low spirits;' but the cultivators are not of that opinion; they anathematise the beverage, and deplore their vineyards, ruined long ago by a tax, as do most of the Norman race, who grow no grapes now. Among the pleasant paths of Orcher, it is quite easy to wander away a few pastoral hours. We may mention Fecamp, with the remains of its royal abbey, famous for its 'Water of Monks and Monarchs,' distilled by the

Fathers in secret; and Trouville, 'the Norman oasis,' which the elder Dumas claimed to have discovered. At summer-tide, when three or four thousand strangers, chiefly from Paris and the populous cities on the banks of the Seine, are congregated at Etretat, in the great gap between the cliffs, the French sea-side appears in perfect character. There is no comparing it with Calais, Boulogne, Dieppe, or any other of the every-day haunts which people mistake for France. Here are two states of society, the most opposite that can be conceived, yet existing together, though the one is in its youth, the other in its decrepitude. They stand utterly apart—the fishing and the fashionable, the denizens and the visitors. The abodes of the fishermen, their haunts, all belongings of theirs, are different; for there has not been time for the new to obliterate the old.

A few years since, Etretat was nothing more than a scattered hamlet, inhabited by fishermen, of a character precisely identical with that of the great fishing-reef spread along the shores of France from Calais to Bayonne, from Marseille to Perpignan. There is not much difference between the class of men who harpoon the tunny in the waters of Toulon, the Normans who provision the markets of Paris, or the Bretons who preserve the sardine shoals for the salters and packers of La Guerande. Enter their cabins; there is a family likeness between them all—the same rude interiors, hung with nets—half-buried in sand, or perched, like nests, on the peaks of rocks; the same muscular type of men, with nervous limbs, bronzed complexions, active, laborious, and sober, and spending half their lives in their boats; the same robust class of women, watching fish-traps, mending nets, preparing the 'catches' for sale, collecting oysters, muscles, and cockles, carrying burdens, cooking, and each, in some way, a schoolmistress of the household. This is the fisherman, and the fisherman's life, no matter whether at Perpignan or at Etretat, where it is found, unchanged from immemorial time, on the sea and on the land, but especially in the clustered cottages that look like a part of the scenery, and which, in contrast with the fresh manners that are taking possession of the valley, remind you of a work by an old Dutch master hung side by side with one by the youngest favourite of the Royal Academy. The dwellers in the hamlets have an inherited affection for their abject abodes; they have not yet been transformed into Brighton or Ramsgate boatmen; they keep, for the most part, to their flinty share of the beach, which the holiday-makers rarely approach; go up to the altar of 'Our Lady of Safety'—a chapel which they themselves built, at a great elevation, passing the stones from the valley to the height, hand-over-hand, like buckets at a fire; cultivate their ungrateful gardens, and accept with gladness the small profits of their precarious industry.

I do not see how the condition of this class has been at all improved by the periodical influx of money-spending strangers. In spite of all, however, they seem content with their rude homes, of a gleaming white or brilliant crimson, often picturesquely ensconced in the richly tinted recesses of the rock, far up above the sea, and modestly overlooking it. Yet will this be for long? How long did it take Trouville to change from a group of cabins planted round a chapel into a town of thirty streets, with twenty thousand visitors each

summer, a casino, a carriage promenade, and the fashion of wearing five different dresses every day ! The transformation is going on rapidly enough at Etretat. The way over the cliffs, along the well-made road, among handsome groups of trees, leads to the Etretat of the future ; fantastic country-houses, which suggest the idea of having been just unpacked, after having been brought down, ready-made, from St Germain, or over from Biarritz ; there are gay shops ; there is an hotel ; the sands have their loungers ; pleasure-skiffs are putting out upon excursions to the giants of the water that so grotesquely adorn the sea-approach, or to the marine grottos, the Maidens' Hall in particular, whence the ghosts of three young girls, headed up in a barrel once upon a time, and flung among the billows, by a cruel baron, emerge every night, in long pale robes, to revisit the ruins of that which was once their castle. All is bright and fluttering enough, these summer noons.

Three bells hang in the tower of 'Our Lady's Kirk' at Etretat. They are named respectively Marie-Celeste, Alexandrine-Clarisse, and Pauline-Adele—presumably after the unfortunate ladies of the cave. Only a few years ago, their chief employment was in calling the fisher-people to prayers, tolling for the dead, and summoning assistance in hours of danger, when a sudden light had arisen in the darkness out at sea, or when, by day, some ship, with bare-headed crew, was seen labouring in the wild waters below. A change has come over this old structure in the narrow and shadowy glen, and it is a lion of the two seasons—for Etretat has two. A still tranquil walk leads to where it stands, beyond the limits of the original village, dark-towered, though no longer lonely. The change is very evident here. I see, it is true, the ancient burial-stones half-buried in the earth, mutilated, mossy, with undecipherable words painted or graven on them ; but there is a growth of modern graves, of a modern fashion, in their midst ; decked with bead-wreaths and crosses, glazed niches, artificial flowers, frivolous dolls, rhymed prayers ; and so at the fisherman's especial fane, a miniature chapel on a height above, visible from far off, whose doors are never shut by night or day, where there is no priest and no congregation, but whither the sailors come with their supplications for safety, or thank-offerings for escape or good-fortune. It is very warm and bright ; and the perspective on every side, though few care to climb so high, is exceedingly inspiring.

The margin of the sea, without metaphor, shines brilliantly golden in the downward distance ; the rocks look like pebbles, and the pebbles like grains of sand. Turn in one direction, and the face of the cliff, draped with moss of varied colours, sparkles with the scattered waters of a scarcely visible cascade that pours in spray from the summit ; below, is 'the great bath of the seagull,' whither that clamorous bird is taking his way ; in front, are giant rocks towering out of the water, so white that they seem to have caught the whiteness of the foam ; and, wending along an upward path, certain children, headed by a priestly figure, and two or three 'sisters' in snowy head-dresses, are going to early prayers. One thing is noticeable at Etretat—no matter how calm the sea, it is never silent ; the echoes from the grottos are perpetual, though ranging from a sonorous murmur to a thunderous uproar ; for the

waters often come in, though not in this June weather, so mightily and fiercely, that they seem as if about to rend the great rocks from their foundations. By some, indeed, the village is preferred as a winter lounge ; but it is seldom real winter at Etretat, notwithstanding its northerly position—that is, you rarely have any snow, and people frequently bathe in December. I have seen it under both aspects, and while remembering pleasantly its new-year galas, prefer the sultrier month that dresses with figs, and shades with linden trees, the stony foundations of the Petit Val. The good wives sit chatting in the open air ; the tide swells hotly in, with the sun glancing deep into its waters ; the craft of the fishermen, whether lazily stranded, or as lazily afloat, or skimming, as if under sails of brick-red fire, far out beyond the chalky monolith of Beval, seem to glow together with one reflex of the season ; green and yellow rushes, or, rather, a peculiar species of sea-weed, here and there fringe the sand ; and a miniature white château, approached by trellised walks, suggests the idea of a summer-house. There is a girl standing on a hill, shading her eyes with one hand, and holding a child with the other, who is expecting something to make its appearance round that corner of the cliff, down which loose grass and stones are slowly rolling, as if they had done nothing else since the creation.

Women, we see, are hurrying down by La Val-leuse, a steep flight of steps, partly built in the soil above, partly chiselled out of the living rock ; for the sea is going out, and the sands will soon be free from its salt, saturated by the fresh streams that, usually unseen, percolate in all directions the chalk ; and this is the time for Nausicaa and her maidens to be at work—very brawny Nausicaas, very un-Grecian maidens. Here they are, each with a bundle of 'linen' (French for dirty clothes of all sorts) under her arms. They disperse to their several stations ; they kick up holes in the sand with their wooden shoes, which instantly brim with soft, fresh water, and they ply their labours in this natural laundry amid a din of talk. For this is the Rialto, the Parliament, the Exchange of the fishing-people of Etretat. It is here that all matters are discussed interesting to them and theirs : the price of their single commodity in the neighbouring hamlets ; how much the owner of boat 49 will have earned by next St Sylvester's Day ; what marriages are whispered of. And the dames and damsels of the locality have it all their own way here ; no man ever approaches their conference, unless it be, at long intervals, some unlistening coastguard, or unconscious stranger. But even this privileged and primitive ground of gossip is in danger by another tide than that of the sea. Already, the purely local chatter is mingled with echoes from a world which, within living memory, might have been heard of, but certainly never had been seen in that sequestered angle of the Norman coast. The original simplicity is fading out. 'Tourists,' or the Parisian equivalent for them, scrawl their names on the rock walls of the Maidens' Chamber, and would, for the same purpose, try to reach Romaine's Cavern, if they dared to try. Nowhere near Etretat at all will remain those 'solitudes for two,' which, in all likelihood, will long be found in the farther seclusions ; and the little cliff-defended, church-tipped, cottage-clustered, white-fronted, yellow-floored, blue-edged, green-embroidered valley,

shorn of its idyllic graces, must in course of time degenerate into a play-ground for the bigger valley which brings the Seine from Paris, and a good deal of Paris with it.

### EDIBLE BIRDS' NESTS.

EDIBLE birds' nests are found for the most part in the Southern Archipelago. The chief region of supply is that comprising Java, Borneo, Celebes, and the Sulu Islands. The bird, which produces the nests is a little swallow, *Hirundo esculenta*. This salangan swallow, as it is called, is slightly bigger than a blue tit; it has a brown back; but the under surface of its body, as also the extremities of the feathers in its forked tail, are white. It flies with wonderful speed and precision; and on the Javan coast, where the surge breaks wildly against the precipitous and caverned walls of rock, the little birds may be seen in swarms darting hither and thither through the spray. They probably feed on fragments of molluscs and other small animals which abound on those coasts. As you watch the surface of the water rising and falling, you notice how the holes in the rock are now concealed, now open again; and the little creatures, watching their opportunity, dart in and out with lightning speed. Their nests are fixed to the arched roof of these caverns.

What sort of a thing, then, is the edible bird's nest that ministers to the taste of the luxurious Chinese? It is that portion of the fabric which serves as a sort of bracket on which the nest itself (made of grass, sea-weed fibres, small leaves, &c.) is built. There are two forms of this support, one flat like an oyster-shell, the other deep and spoon-shaped. It is a transparent mass, somewhat like isinglass, mother-of-pearl, or white horn, and is of animal origin. It was formerly supposed that this gelatine-like mass might be prepared in the bird's crop, from sea-weed and other marine plants. This, however, is a mistake. If one opens the animal's stomach about the time of building, it is found to contain insects, but no vegetable matter; moreover, in all species of the family of swifts, the crop is wanting. Dr Bernstein has found that at that season the salivary glands under the tongue are enormously developed. On opening the bill, they are seen as two large swellings, one on either side, and these chiefly supply the material in question. They secrete a viscid mucous substance like a concentrated solution of gum-arabic, which can be drawn out of the mouth in long threads; and in the air, it soon dries, and is found to be the same (even microscopically) as the bracket material. Blades of grass and similar objects can be stuck together with this saliva; and there is a species of salangan (supposed, but erroneously, to feed on sea-weed) which does not make a pedicle or bracket on which to build its nest, but merely sticks together, by means of its saliva, some grass, dry leaves, and sea-weed, and fixes them directly to the rock. The nests of this species, however, are not of great commercial importance.

When one of the little birds wishes to begin building, it flies repeatedly against the selected spot, pressing each time a little saliva against the rock with the tip of its tongue. This it will do from ten to twenty times, moving away not more than a few yards in the intervals. It then alights, and arranges the material in semicircular or horse-shoe form on the rock, continuing to add saliva; and by the motions of its body from side to side, the yet soft saliva is forced out over the harder parts, producing those peculiar undulatory bands which give the nest a stratified appearance. It is thought not unlikely that part of the secretion used by the bird comes from the largely developed glands in its stomach; also, that gelatinous matters picked up in the surge are employed in the construction of its nest. The salangan never uses the same nest more than once, and that for only a month, and after the young brood is flown, the nest soon decays and falls to pieces. The salangans are generally found to build their nests in the rocks of the coast, but not always. Thus, multitudes of them are met within the limestone caverns of the district Bandong, which is nearly in the middle of Java, and ten miles from either the north or the south coast. It is ascertained, too, that these birds leave their nests every morning to seek their food along the coast, so that they must travel at least a score of miles daily; in fact, these busy creatures, like the swifts of our summer, appear to be on the wing the whole day long.

If we are ready to wonder at the dexterity with which the little birds dart in and out of their dark rocky home, against which the ocean surge thunders with ceaseless fury, and bursts into upward-leaping foam, the exploits of the hardy natives whose business it is to 'pluck' the nests will still more surprise us. These men form a distinct and very exclusive class or craft. They have a special guardian angel, the goddess Loro, the queen of the coast, who rules the surge. This goddess (Jungghuh informs us) is held in high reverence. At a place called Rongkop, there is, on the summit of a bold rock, a temple erected in her honour. No mortal dwells there; and no one will pass without raising his hands to his head in grave salutation. It is death for any one to attempt to enter, except the chief of the society of nest-pluckers, who fills the office of priest. The goddess is supposed sometimes to come up from the sea, and go into this her dwelling, which is adorned with beautiful vessels, couches, and garments, whereof she may make use at her pleasure. The priest occasionally enters to remove dust from the furnishings. At such times, sacrificial incense is burnt at the door; not a word escapes the chief's lips; and the company outside remain in silent reverence on their knees. The plucking of the nests is preceded by a festival before the house of the goddess. Clean mats are spread on the grass, and covered with various articles of food. The priest first invites Queen Loro to take her place and partake of the dainties, while all the company throw themselves on their faces on the ground. Then the priest gives a signal, the men rise again, and the feast proceeds; while sounds of music come from the background, and dancing-girls make their appearance, decked with flowers.

We have now to consider the adventurous work of gathering the nests. The plucker, with nothing on but a cloth round his loins, and with a knife and a

netted bag at his side, takes his place on a stage (of two cross-bars) fastened to the end of a rope, and is let down against the face of the precipitous rock. With the left hand he grasps the rope; in the right, he has a rod, with which he holds himself as far as possible from the rock. Thus he descends, often several hundred feet, amid the roar of the breakers and the swarming of innumerable birds. When he has come opposite a salangan hole, he makes a signal, and the lowering is stopped. He now sets himself swinging—and here follows the most dangerous part of the operation—gradually increasing his width of swing, till he thinks he will be able to leap off into the hole, and find foothold on a part of the rock which he has previously noted. Should the venture fail, death is certain. The man has generally a thin cord fastened round his body, and connected with the rope, so as to enable him to pull the stage to himself again. Sometimes, though rarely, this cord breaks, and then there is nothing for it but to make a bold spring out towards the dangling stage. But so fearless and practised are the men, that they generally accomplish this fearful leap successfully, even when laden with their booty. When the plucker has got safely into the hole, he cuts off the nests with his knife, and puts them in his bag; for those high up, he uses the rod with the knife fixed to the end of it. The operation demands great address; the slippery rock, perhaps, hardly affords standing-ground, and the man will cling with hand and feet to the little cracks or projections; while the alarmed birds flit to and fro in the gloom, and the tumultuous water beneath flashes with phosphorescence. The plucker, however, knows his work, and when he is sufficiently laden, he draws the stage towards himself, mounts it, and is pulled up by his companions. Thereupon, another repeats the operation.

As the method just described is both a dangerous and a slow one, the natives adopt, when possible, another, which consists in fixing a rope-ladder from the top of the rock down to the cavern, and also a sort of hanging bridge of rope within the cavern, either running round the wall, or passing across. The internal surface of the cavern is often greatly pitted by the action of the weather, presenting a spongy appearance, so that it is not difficult to find points for attachment of the ropes. The craft is so very exclusive that no foreigner is permitted to enter the cave or be present at the ceremonies. Some Dutch merchants, indeed, once attempted to enter the caves, but none of them ever saw the light again. 'The goddess Ioro has taken them to her bosom,' said the Javanese; and this was all the explanation they would vouchsafe.

The salangan swallows breed four times in the year, each time (as has been said) building a fresh nest. The nests are plucked three times, and thus only one brood is left to the birds. There is no perceptible diminution, however, of their number, which is pretty accurately known, as the nests are counted, and two birds are reckoned to each. The five caverns at Karang Bollong, in Java, thus contain 330,000 swallows, from which, in three pluckings, about 600,000 nests are annually taken. The plucking takes place always at the time of 'ripeness'; that is, when the majority of the nests contain young that are just beginning to be fledged. When they are fully fledged, the nests have become

coloured and useless. All the young birds and eggs found are cruelly thrown into the sea. The best 'harvest' is in the months of July and August; the next best, in November and December; the worst, in April and May. The collected nests are cleaned and assorted; they are first packed in bags of bamboo fibre or palm bast, and the merchants again pack them for the market (after a second assortment) in cases containing a half picul, or seventy pounds.

China is the only considerable recipient of these cases; the few cases which are brought as a curiosity to Europe and America are hardly worth mention. The greatest trade in birds' nests is done with Canton, the entire import there being reckoned at 1200 piculs, or 168,000 lbs. We may reckon on fifty nests to the pound, so that altogether 8,400,000 nests, or, from three pluckings, the products of 2,800,000 pair of birds, are annually introduced into China. There are, principally, two kinds of nests distinguished in Canton—the mandarin nests, and the ordinary; the former, or perfectly white kind, are sold at three to four thousand dollars per picul, which is double their weight in silver. Each pound thus costs in China twenty to thirty dollars, a quite exorbitant price, compared with that which the salangan pluckers themselves receive for their dangerous work, and which is, at the most, only ten to twelve per cent. of the market value. The second quality of nests are sold at sixteen hundred to twenty-eight hundred dollars. There is a small trade done in the kind of nest built by the so-called seaweed-eating salangan, referred to above; these are sold at two hundred dollars the picul. The nests are dissolved in water or broth, and so taken as soup. It is highly spiced with minor substances. This forms an entrée which is rarely wanting on the tables of the wealthy Chinese, and never from that of the imperial court at Peking. The Chinese set a high value upon it, considering it one of the best stimulants; but for this opinion there seems to be little or no ground. The most recent analysis of the nests we owe to Professor Troschel of Bonn. He finds that the material does not consist of specially nourishing or stimulating substances, but is quite similar in constitution to any animal saliva. Thus the Chinese pay dearly for what has really no intrinsic value.

#### SONNET.

How sweet to watch from some vine-covered hill,  
That overlooks the peaceful vale below—  
Round which in solemn grandeur white and still,  
Clad in their robes of everlasting snow,  
With hoary peaks uplifted to the sky,  
Italia's sentinels, her mountains, stand—  
A summer sunset and the daylight die  
First in the valley, as if Twilight's hand  
Were laid upon it, and it fled away  
To sleep amid the mountains' ice and snow;  
To nestle there until a new-born day  
Shall wake to joy and life the world below.  
If thou hast ever seen this picture, say,  
Can any land a fairer, brighter shew?

## A CARNIVOROUS PLANT.\*

Is it a fact that some plants capture and feed upon insects? Can they digest animal food, and are they nourished by it? Numerous careful observations have placed this fact beyond doubt; but not content with the views of others, I have tried many experiments which have confirmed me in the above opinion. Throughout the vegetable world there are many instances of plants being fly-catchers, without being at the same time fly-digesters. Of these I shall not treat, but shall confine myself to those which digest and absorb the victims which they have seized, and even this class includes several—such as the Sundews, which sparkle in the sunshine in so many marshy spots in our own country; Venus' Fly-trap, whose geographical distribution is confined to the marshes of North Carolina; the common Butterwort, which inhabits our island, and shews its incurved leaves on marshy soil; and the Pitcher-plants, which never grace our country with their presence, except in hot-houses, where many species are cultivated. There are other plants to which a like property has been attributed, but, instead of enumerating these, I shall best succeed in introducing my readers to the mysteries of the process which they adopt, by selecting one of those already named, and tracing the course which it pursues when an unwary fly has come within its reach.

I have no hesitation in choosing Venus' Fly-trap (*Dionæa muscipula*), as it is the best known of this class of plants. It has a peculiar appearance, and when once seen is not easily forgotten. A number of winged leaf-stalks spread out in a radiating manner from the root, each carrying at its termination a leaf in connection with which all the strange phenomena are displayed. This leaf consists of two blades, on each of which are three hairs; a midrib or kind of hinge unites the two

blades, while these latter are surrounded above by hair-like processes much resembling eyelashes, but which, from being connected with the deeper structures, and not with the superficial ones alone, are not generally regarded as *true hairs*, and hence we shall name them spines. Over the upper surface of each blade are numerous little red bodies, which are specially abundant in the vicinity of the six hairs. When these hairs are touched, the blades close, and the spines cross at right angles, interlocking exactly like the fingers of a closed hand; and the red bodies yield the secretion which is the active agent in digestion. Let us now view the plant in active operation. The weather is warm, and consequently its appetite is very keen, when an incautious fly, attracted, it may be, by the roundish glands of a fine red hue, lights on the surface of the leaf, and has scarcely taken a step when one or more of the six sensitive hairs are touched, and immediate closure of the blades ensues; even if this process were not instantaneous, the bending of the marginal spines would present a barrier to its upward progress, and cause it to irritate anew the hairs, and thus hasten the contraction. The fly is now caught; but, as the leaves have only come together at their margins, a considerable hollow space is left in the centre, and if the leaf be held between the observer and the light, the fly may be seen moving about from end to end of the leaf in quest of a means of escape. The force with which the blades contract is very considerable, and renders it quite impossible for the fly to force it open. In this narrow prison it may remain alive for some time, for even at the end of two days I have removed one still living; but sooner or later a slightly viscid fluid, secreted by the red glands, is thrown out, which envelops the insect and soon terminates its existence. The blades now press more closely together, till ultimately the two sides are in close apposition, so far as the inclosed object will admit of that. This secretion is of an acid character from the presence of formic acid, and there is reason to believe that there is in it a substance like pepsine, which plays so important a part in

\* This article has been written for us by an experienced naturalist. The interesting work on *Insectivorous Plants*, by Charles Darwin, may be consulted for further details on the subject.—ED.

the digestion of man and of the lower animals; and under the influence of this, the material of the fly capable of yielding nourishment to the plant is digested, and ultimately absorbed by the same red glands which secreted the fluid, and which have in their interior bodies like mouths, which botanists call stomata. This process may not be completed for three weeks, but it is sometimes accomplished in a shorter time, and after the whole material substance of the fly has disappeared, the two blades of the leaf again open, when a mere semblance of the creature is found lying on them, which, on pressure, yields nothing from its interior, all its substance having been absorbed. Some supposed that the digested material was not absorbed by the leaf, but that it ran down the channelled petiole and so came into contact with the roots, which absorbed it; but experiment shews that such is not the case, and hence we are shut up to the idea of absorption, for the substance was certainly inside the leaf, nothing has escaped from the leaf outwardly, and yet nothing is now found within. Darwin has shewn that there is direct evidence of absorption, for 'where bits of meat and crushed insects were several times placed on glands, and these were compared after some hours with other glands from distant parts of the same leaf, the latter shewed not a trace of aggregation, whereas those which had been in contact with the animal matter were well aggregated.'

Such is the merest sketch of the mode in which a fly is caught and digested, and if you ask me how large a creature can be thus summarily disposed of, I answer that that depends very much on the size of the leaf. Now, these leaves of the Venus' Fly-trap vary much in dimensions: the largest which I have ever seen measured in length, from one end of the blade to the other, an inch and a half; from the midrib to the edge of leaf, from which spines proceed, three-quarters of an inch; while the spines themselves measured half an inch. The spines numbered twenty-four on the margin of the right blade, and twenty-three on that of the left. It had a grand and imposing effect as it stood erect in a hanging basket in a green-house, but I doubt not had sent many a thrill of horror through the frames of beetles, cockroaches, spiders, &c. Yet we must not suppose that our friends the *Dionæas* are chargeable with gluttony; on the contrary, their appetites are easily satisfied, two or three flies of moderate size being the limit beyond which they seldom go. They also seem to prefer the catching of their own game, for if we take to feeding them artificially, and with injudicious kindness attempt to overdo that act, they are almost certain to fall victims to such an attempt. I have seen fatal issues from such a course, where raw beef was the substance employed; in moderate quantity they can digest this well, but a surfeit proved fatal. Milk they can take easily, and with relish, and if you indulge yourself with a peep into their leafy stomach after that diet has been taken, you will find that it has speedily separated into curd and whey, and that the former becomes dissolved; nine days in one instance sufficed to make the curd nearly disappear. But while casein in this loose form seems only to benefit the plant which partakes of it, yet in its compressed form, as cheese, it is highly detrimental, and on several occasions it has caused the death of the

leaf which had inclosed it. In one instance I trusted that, as old moulded cheese is rather an aid to digestion in the human stomach, it might prove to be equally so in that of the *Dionæa*, but I was doomed to be disappointed, as the leaf with the fresh and that with the old cheese became black about the same time. Salt, so valuable in human digestion, seemed most deleterious in that of this plant, which succumbed to the attempt to render the boiled white of egg savoury. When a sufficient amount of food has been taken by the plant, it gives distinct indication of such being the case, by refusing to respond to any amount of stimulation of the sensitive hairs.

I have spoken of the blades contracting, and in reference to this property the questions naturally suggest themselves: Has this contraction any relation to the kind of object inclosed? and, How is the closure effected?

In replying to the first question, I unhesitatingly affirm that it does bear an important relation to such an object; for, if the inclosed substance be an indigestible material, such as a pebble, brick, or chalk, &c., the contraction, though it takes place in response to the irritation of the hairs, will not continue for any length of time; whereas, if the substance offered has nutrient material, the leaf not only closes, but continues closed till the nutriment has been exhausted.

The second question, as to the means by which the closure is effected, is one of considerable difficulty. Carpenter and some others believed that it was owing to two sets of cells in the midrib, situated in the upper and lower layers of that structure, the former being endowed with the power of contraction, and the latter being equally so with that of distension. When a stimulus is applied, the contracting cells send their contents into the lower or distensible ones, which naturally enough causes the blades to close. But the removal of the lower half, or even more of the midrib, does not prevent the closure from taking place. We may therefore dismiss this supposed means of explanation. Mr Darwin, in his recent work *Insectivorous Plants*, propounds a theory founded on observed facts connected with this plant, and which is applied both to the general closing and to the incurving of the blades; but neither his view nor that of Carpenter accounts for the special movements of the marginal spines, which take place at first simultaneously with the closure of the leaf, but which afterwards exhibit independent movements. Moreover, the amount of contraction of the leaf-cells does not seem to me to be sufficient to close the blades. On the whole, I cannot regard Mr Darwin as so felicitous in this instance as, in so many others, he undoubtedly is. His accurate observations, however, on this point are most valuable, and unquestionably have a very important bearing on the process, though they do not completely account for the full closure of the leaf.

These blades have spiral vessels running through them from the midrib; and these enter the spines, where I have traced them, for four-fifths or five-sixths of the length of the spines. They form a very peculiar and interesting kind of network in the blades, but it is quite different from the reticulated structure in ordinary leaves; in some parts they bear no small resemblance to the arrangement of the fibres in the optic nerve. I cannot

doubt that these spiral or corkscrew-like vessels play some important part in connection with the simultaneous movement of all the parts.

But what, you may ask, about the sensitive hairs, placed on the surface of the blades, and which are so intimately connected with the closing of the leaf? They are six in number, three on each blade, though in some rare cases they may be more or fewer; thus, in one instance, I found only five in all, three on one, and two on the other; and Darwin speaks of having seen two leaves with four filaments or hairs on each side, and another with only two. These hairs often stand erect, but they are sometimes slightly inclined. On looking across the leaf at them, you may observe a thicker portion next the leaf; this is a sort of pedestal consisting of a different kind of cells from that which constitutes the tapering hair; but in the case of both hairs and pedestals I could never find anything entering into their construction but simple cells. At the junction of the hair with the pedestal, there is a peculiar appearance, which naturally leads one to suppose that it would serve as a joint for the hair, enabling it to bend to the side when the contraction of the blades had reached that point where the opposite sides were nearly in contact, or when they were pressing on an interposed object. Where there is sufficient space for them in the interior they do not bend, for I have cut a leaf, on which a small piece of albumen had been placed, right through from the midrib to the spines, and have seen the hairs projecting out from the sides in a straight direction.

By frequently touching these hairs, and causing the leaf to close, you ultimately much impair their irritability. A curious circumstance connected with these sensitive hairs, is that, if you cut them quite off, the leaf closes, and on opening and being irritated at the part where the hairs used to be, it sometimes refuses to close, and at other times closes very slowly and awkwardly, while on other occasions it does so at once: thus, on June 29, hairs all cut off and the leaf closed; June 30, still closed; on July 1, leaf open, and will not close on irritation; July 2, leaf closed slowly on irritation; July 5, leaf open, but will not close on any amount of irritation being applied; July 6, irritation to-day, though repeated several times, has no effect in making it close; July 7, leaf quite open, but closes easily on irritation.

Some other experiments gave somewhat similar results. In one of these I had irritated to a great extent the part from which the hairs had been removed, without the least movement taking place, but in about half-an-hour afterwards I was astonished to find the leaf quite closed.

The removal of the hairs does in almost all instances very seriously affect the closing movement, for there is then generally an unusual slowness manifested in accomplishing that act, and there is also often a great awkwardness displayed by the two blades failing to act in concert.

It is difficult to account for the leaves closing at all under such circumstances. Is it the case that, when the usual medium for receiving impressions has been withdrawn, other parts of the leaf are to a certain extent endowed with this peculiar property? Such a question is difficult to answer, but the facts seem to point to some such solution of the difficulty, for in all ordinary cases we have already seen that the impression must in the first

instance be made *on the hairs*, and from them it radiates in all directions. I am aware that the absorption of nitrogenous matter will cause a slow closing movement, as well as secretion of fluid, for I have myself witnessed such a result; but such a case is entirely different from those above mentioned, as in them nothing was employed but simple stimulation by a pencil or knife, &c.

When we contemplate the admirable provision which has been made in connection with this leaf, for enabling the plant to secure its supplies of nourishment; and when, moreover, we contemplate how wondrously the whole arrangement adapts the plant and its allies for clothing with variety marshy districts—for in such places the supply of nitrogen is scarcely to be obtained from the soil, and the roots bear testimony to the same fact, being of a most undeveloped nature—when, I say, we contemplate these things, can we refrain from exclaiming with grateful and adoring hearts, 'O Lord, how manifold are thy works! in wisdom hast thou made them all.'

## THE FLAG OF DISTRESS.

### CHAPTER VII.—A COUPLE OF CALIFORNIAN 'CABALLEROS.'

THE true types of Californian chivalry, or villainy, have just emerged from the suburbs of San Francisco, taking the road which leads southward along shore.

Both are garbed in grand style—in the national costume of California, which in point of picturesque-ness is not exceeded by any other in the world.

They wear the wide trousers (*calzoneras*), along the outer seams lashed with gold lace, and beset with filigree buttons; the snow-white drawers (*calzoncillos*) here and there puffing out; below, *botas* and spurs—the last with rowels several inches in diameter, that glitter like great stars behind their heels. They have tight-fitting jackets of velveteen, closed in front, and over the bosom elaborately embroidered; scarfs of China crape round their waists, the ends dangling adown the left hip, terminating in a fringe of gold cord; on their heads *sombreros* with broad brim, and band of bullion—the *toquilla*. In addition, each carries over his shoulders a *manga*—the most magnificent of outside garments, with a drape graceful as a Roman *toga*. That of one is scarlet-coloured, the other sky-blue. Their horses are not less grandly bedecked. Saddles of stamped leather, scintillating with silver studs—their cloths elaborately embroidered; bridles of plaited horse-hair, pointed with tags and tassels; bits of the Manaluke pattern, with check-pieces and curbs powerful enough to break the jaw at a jerk.

The steeds' thus splendidly caparisoned are worthy of it. Though small, they are of perfect shape—pure blood of Arabian sires, transmitted through dams of Andalusia. They are descended from the stock transported to the New World by the *Conquistadores*; and the progenitor of one or other may have carried Alvarado, or Sandoval—perhaps Cortez himself.

The riders are both men of swarthy complexion, with traits that tell of the Latinic race. Their features are Spanish; in one a little more pronounced than the other. He who wears the sky-

coloured cloak has all the appearance of being Mexican born. The blood in his veins, giving the brown tinge to his skin, is not Moorish, but more likely from the aborigines of California. For all that, he is not a *mestizo*; only one among whose remote ancestry an Indian woman may have played part; since the family-tree of many a proud Californian has sprung from such root. He is a man of medium size, with figure squat and somewhat spare, and sits his horse as though he were part of the animal. If seen afoot, his legs would appear bowed, almost banded, shewing that he has spent the greater part of his life in the saddle. His face is flat, its outline rounded, the nose compressed, nostrils agape, and lips thick enough to suggest the idea of an African origin. But his hair contradicts this—being straight as needles, and black as the skin of a Colobus monkey. More likely he has it from the Malays, through the Californian Indian—some tribes of which are undoubtedly of Malayan descent. Whatever the mixture in his blood, the man is himself a native Californian, born by the side of San Francisco Bay, on a *ganaderia*, or grazing estate. He is some twenty six or seven years of age, his name Faustino Calderon—'Don' by ancestral right, and ownership of the aforesaid *ganaderia*.

He in the scarlet manga, though but two or three years older, is altogether different in appearance, as otherwise; personally handsomer, and intellectually superior. His features better formed, are more purely Spanish; their outline oval and regular; the jaws broad and balanced; the chin prominent; the nose high, without being hooked or beaked; the brow classically cut, and surmounted by a thick shock of hair, coal-black in colour, and waved rather than curling. Heavy moustaches on the upper lip, with an imperial on the under one—the last extending below the point of the chin—all the rest of his face, throat, and cheeks, clean shaven—such are the facial characteristics of Don Francisco de Lara, who is a much larger, and to all appearance stronger, man than his travelling companion.

Calderon, as said, is a gentleman by birth, and a *ganadero*, or stock-farmer, by occupation. He inherits extensive pasture-lands, left him by his father—some time deceased—along with the horses and horned cattle that browse upon them. An only son, he is now owner of all. But his ownership is not likely to continue. He is fast relinquishing it, by the pursuit of evil courses—among them three of a special kind: wine, women, and play—which promise to make him bankrupt in purse, as they have in character. For around San Francisco, as in it, he is known as a *roué* and reveller, a debauchee in every form, and a silly fellow to boot. Naturally of weak intellect, indulgence in dissipation has rendered it weaker.

Of as much moral darkness, though different in kind, is the character of Don Francisco de Lara—'Frank Lara,' as he is familiarly known in the streets and saloons. Though Spanish in features, and speaking the language, he can also talk English with perfect fluency—French too, when called upon, with a little Portuguese and Italian. For, in truth, he is not a Spaniard, though of Spanish descent, a Creole of New Orleans—hence his philological acquirements. He is one of those children of chance, wanderers who come into the world nobody knows how, when, or whence;

only, that they are in it; and while there, performing a part in accordance with their mysterious origin—living in luxury, and finding the means for it by ways that baffle conjecture.

Frank Lara is fully thirty years of age; the last ten of which he has spent on the shores of San Francisco Bay. Landing there from an American whaling-vessel, and in sailor costume, he cast off his tarry 'togs,' and took to land-life in California. Its easy idleness, as its lawlessness, exactly suited his natural inclinations; and, above all, his *penchant* for gaming. He soon became a noted character in the cockpit, as at the card-table, making money by both—enough to keep him without the necessity of asking favours from any one.

Similar inclinations and pursuits, at an early period, brought him and Calderon in contact; and relations have been formed between them, now firmly fixed. Of late more than ever; for, since the breaking out of the gold-fever, with its consequent Anglo-Saxon invasion, they have become united in a business partnership—in a *bank*. Not one of the ordinary kind, for discount and deposit, with desks and counters for the transaction of affairs; but such as may be seen in any Californian town. A drinking saloon containing tables, covered with green cloth, and rows of chairs or benches around them: in short, the species known as a '*monté* bank.'

Since the discovery of the gold *placers*, the streets of San Francisco have become crowded with men mad after the precious metal; among them some who do not desire to undergo the toil of sifting it out of sand, washing it from river-mud, nor yet crushing it clear of quartz-rock. They prefer the easier, and cleaner, method of gathering it across the green baize of a gambling-table.

To accommodate such gentry, Don Francisco de Lara has established a *monté* bank, Don Faustino Calderon being his backer. But though the latter is the moneyed man, and has supplied most of the cash to start with, he does not shew in the transaction. He has still some lingering ideas of respectability, and does not desire to appear as a professional gambler. He acts, therefore, as the sleeping partner; while De Lara, with less reputation at stake, is the active and ostensible one.

Such are the two men, splendidly attired and magnificently mounted, who have issued from the new-named town of San Francisco, and are riding along the shore of its bay. As they canter gently through the suburbs, they are seen by several, who know and recognise them; many admire their grand style and picturesque habiliments, and notably the gold-diggers and other late comers to California, who have never before seen citizens in such shining array. Farther on, the gamblers encounter but few people, and fewer still who know them. For they are now straying beyond the range of red-shirts, and meet only the natives of the country, *rancheros* riding townward. Of such as do recognise them, the greater number can tell where they are going. They would say that Calderon is on his way to the *hacienda* of Don Gregorio Montijo, and could guess his errand. About that of De Lara, they might not be so sure, though they would suppose him going there too.

Strange all this to one unacquainted with California and its ways—especially one acquainted with the character of the two individuals in question. He would naturally ask: Could men so

tainted be on visiting terms with the family of a gentleman—among the first in California, ranking with its grandest *ricos*, and *familias principales*? By one knowing the country and its customs in the olden time, the answer would not be a negative. For there and then every second man met with was a gambler, either professionally or in practice. And not a few women as well! He who did not occasionally cast dice, or stake doubloons upon the turning of a card, was a *rara avis*. The keeper of a *monté* bank might not be deemed so respectable as a banker of the ordinary kind; not only was he not socially outlawed, but if rich, 'society' rather caressed him.

As yet, Don Faustino Calderon has not come under the category of the professional 'sport,' and respectability does not repel him. His dissipated habits are far from exceptional, and his father's good name still continues to throw its *egis* over him. Under it he is eligible to Californian society, of the most select kind, and has the *entrée* of its best circles.

And so also Don Francisco de Lara—in a different way. Wealth has secured him this, for although anything but rich, he has the repute of being so, and bears evidence of it about him. He is always stylishly and fashionably attired; his shirt of the finest linen, with diamond studs sparkling in its front. Free in dispensing gratuities, he gives to the poor and the priests—the last kind of largess being a speculation. He intends it as such, and it has well repaid the outlay. For, in California, as in other Catholic countries, the dispenser of 'Peter's Pence' is sure of being highly esteemed. Frank Lara has done this with a liberal hand; and is therefore styled Don Francisco de Lara—saluted as such by the sandalled monks and shovel-hatted priests who come in contact with him. In addition to all, he is good-looking and of graceful deportment, without being at all a dandy. On the contrary, he carries himself with earnest air, calm and cool, while in his eye may be read the expression, *noli me tangere*. A native of New Orleans, where duels occur almost daily, he is up in the *art d'escrime*. Since his arrival in California he has twice called out his man—on the second occasion killing him.

*Escroc* as the French might call him, 'blackleg' in the English vocabulary, 'sport' in American phrase, Frank Lara is a man with whom no one who knows him would like to take liberties.

In the companionship of Calderon—under his wing, as it were—he has been admitted into the best houses, and along with the latter, is now on the way to visit that of Don Gregorio Montijo. That their visit is of unique character, and for an important purpose, can be gleaned from the speech passing between them as they ride along the road.

'Well, Calderon,' says De Lara, 'from something you said before setting out, I take it you're going to Don Gregorio's on business very similar to my own. Come, comrade! declare your errand.'

'Declare yours.'

'Certainly. I shall make no secret of it to you, nor need I. Why should there be any between us? We've now known one another long, and intimately enough, to exchange confidences of even the closest kind. To-day mine is—that I mean proposing to Don Gregorio's daughter.'

'And I,' returns Calderon, 'intend doing the same to his grand-daughter.'

'In that case, we're both in the same boat. Well; as there's no rivalry between us, we can pull pleasantly together. I've no objection to being your uncle; even admitting you to a share in the Spaniard's property, proportioned to your claims of kinship.'

'I don't want a dollar of the old Don's money; only his grand-daughter. I'm deeply in love with her.'

'And I,' continues De Lara, 'am just as deeply in love with his daughter—it may be deeper.'

'You couldn't. I'm half-mad about Inez Alvarez. I could kill her—if she refuse me.'

'I shall kill Carmen Montijo—if she refuse me.'

The two men are talking seriously, or seem so. Their voices, the tone, the flashing of their eyes, the expression upon their faces, with their excited gesticulation—all shew them to be in earnest. At the last outburst of passionate speech they turn round in their saddles, and look each other in the face.

De Lara continues the dialogue: 'Now, tell me, Faustino; what hope have you of success?'

'For that, fair enough. You remember the last *fandango* held at Don Gregorio's—on the day of the cattle-branding?'

'Certainly I do. I've good reason to remember it. But go on.'

'Well, that night,' proceeds Calderon, 'I danced twice with Dona Inez, and made many sweet speeches to her. Once I went farther, and squeezed her pretty hand. She wasn't angry, or at all events didn't say, or shew it. Surely after such encouragement I may ask that hand in marriage—with fair presumption of not being refused. What's your opinion?'

'Your chances seem good. But what about Don Gregorio himself? He will have something to say in the matter.'

'Too much, I fear; and that's just what I do fear. So long as his bit of grazing-land was worth only some thirty thousand dollars, he was amiable enough. Now that by this gold discovery it's got to be good value for ten times the amount, he'll be a different man, and likely enough will go dead against me.'

'Likely enough. It's the way of the world; and therefore, on that account, you needn't have a special spite against the Señor Montijo. You're sure no one else stands between you and your sweetheart? Or is there something in the shape of a rival?'

'Of course there is—a score of them, as you ought to know; same as with yourself, De Lara. Suitors have been coming and going with both, I suppose, ever since either was old enough to receive them. The last I've heard of as paying attentions to Inez is a young naval officer—a midshipman on board a British man-of-war now lying in the harbour. Indeed, there are two of them spoken of; one said to be your rival, as the other is mine. Shall I tell you what's been for some time the talk of the town? You may as well know it, if you don't already.'

'What?' asks the Creole, excitedly.

'Why, that the one represented as your competitor has cut out all Carmen's other admirers—yourself among the rest.'

Bitter words to the ear of Francisco de Lara, bringing the red colour to his cheeks, as if they had been smitten by a switch. With eyes flashing,

and full of jealous fire, he exclaims: 'If that be so, I'll do as I've said'—

'Do what?'

'Kill Carmen Montijo. I swear it. I'm in earnest, Calderon, and mean it. If it be as you've heard, I'll surely kill her. I've the right to her life—by her giving me the right to her love.'

'But did she do that? Has she confessed to loving you?'

'Not in words, I admit. But there are other signs of assent strong as speech, or the hand-squeezings you speak of. Carmen Montijo may be cunning. Some call her a coquette. All I know is that she has led me to believe she loved me; and if she's been playing a false game, she shall rue it, one way or the other. This day I'm determined to ascertain the truth, by offering her my hand in marriage. If she refuse it, then I'll know how things stand, and take steps for squaring accounts between us. She shall find that Frank Lara is not the sort of man to let one of woman-kind either laugh at, or play tricks with him.'

'I admire your spirit, *amigo*. I catch courage from it, and will imitate your action. If it turn out that Inez has been trifling with me, I'll—Well; we must first find what answer there is for us; which we shall, I suppose, soon after ascending yonder hill. One of us may be accepted, the other rejected. In that case, one will be happy, the other wretched. Or both may be accepted, and then we'll both be blessed. Taking things at their worst, and that we both get refused—what then? Despair and a speedy end, I suppose?'

'The last if you like, but not the first. When despair comes to Frank Lara, death will come along with it, or soon after. But we waste time talking; let us forward, and learn our fate!'

With stroke of spur, urging their horses into a gallop, the two *caballeros* keep on; in the countenances of both a cast shewing them half-hopeful, half-doubting—such as may be seen when men are about to make some desperate attempt, with uncertainty as to the result. On Calderon's, notwithstanding his assumed levity, the expression is almost of despair; on that of De Lara it is more of a demon.

#### CHAPTER VIII.—AN ENCOUNTER INEVITABLE.

After having delivered their speeches, so nearly alike in sound, yet so different in sense, the two ladies on the house-top stand for a short time silent, their eyes turned toward the approaching horsemen. These are still more than a mile off, and to the ordinary eye only distinguishable as mounted men wearing cloaks—one of scarlet colour, the other sky-blue. But despite the distance, the young girls easily identify them—both simultaneously, and in tones somewhat contemptuous, pronouncing their names.

'Yes,' says Carmen, speaking in full assurance, with a lorgnette raised to her eyes—hitherto bent upon the British war-ship. 'No truer types of what I've called them than Francisco de Lara, and Faustino Calderon.'

The frown that came over her face at first sight of them remains upon it, as she continues regarding them through the glass. After an interval she adds interrogatively, and with a certain uneasiness of manner: 'Think you they're coming to the house, Inez?'

'That is very likely; I should say, almost certain.'

'What can be bringing them?' mechanically queries Carmen, with an air of increased vexation.

'Their horses, aunt,' rejoins the niece jestingly.

'Don't jest, Inez. It's too serious.'

'What's too serious?'

'Why, these fellows coming hither. I wonder what they can be wanting?'

'You needn't wonder at that,' says Inez, still speaking jocularly. 'I can tell you what one of them wants, and that's Don Francisco de Lara. He is desirous to have a look at the mistress of this mansion.'

'And Don Faustino Calderon is no doubt equally desirous to have a look at her niece,' retorts the aunt in like bantering tone.

'He's quite welcome. He may look at me till he strain his ugly eyes out. It won't make any impression.'

'I'm sorry I can't say the same for Don Francisco. On me his looks do make an impression—one far from being either pleasant, or favourable.'

'It wasn't always so, *thú?*'

'No, I admit. I only wish it had been.'

'But why?'

'Because, now I shouldn't need to be afraid of him.'

'Afraid of him! Surely you're not that?'

'Well, no—not exactly—still'—

She speaks hesitatingly, and in disjointed phrases, her head hung down, with a red spot upon her cheeks, as though she had some reason for reticence—a secret she scarce likes to disclose. Then a quick change comes over her countenance; and, bending closer to the other, she asks: 'Can I trust you with a confidence, Inez?'

'Why need you ask that? You've already trusted me with one, in telling me you love Don Eduardo Crozier.'

'Now I give you another—I once loved Don Francisco de Lara.'

'Indeed!'

'No, no,' rejoins Carmen quickly, and as if half-repenting the avowal. 'Not loved him—that's not true. I only came near it.'

'And now?'

'I hate him!'

'Why, may I ask? What has changed you?'

'That's easily answered. Listen, Inez, and you shall have the explanation. When I first met him I was much younger than now. A mere girl, full of girlish fancies—romantic, as called. They may not be gone yet—not all. But whatever of them remains, no longer turns towards Francisco de Lara. I thought him handsome; and in a sense, so is he. In person, you'll admit, he's all man may, or need, be—a sort of Apollo, or Hyperion. But in mind—ah, Inez, that man is a very Satyr—in heart and soul a Mephistopheles. I only discovered it when I became better acquainted with him. Then, I hated him, and do so still.'

'But why should you be afraid of him?'

Carmen does not reply promptly. Clearly, she has not yet given the whole of her confidence. There is something withheld.

Inez, whose sympathies are now enlisted—seeing that her aunt has some secret cause for suffering—presses for the explanation. She does so entreatingly, in the language of sisterly affection.

'Carmen—dear Carmen! tell me what it is.'

Have you ever given Don Francisco a claim to call you his *novia*?'

'Never! Neither that, nor anything of the kind. He has no claim, and I no compromise. The only thing I've reason to regret is, having listened to certain flattering speeches, without resenting them.'

'Pst! What does that signify? Why, Don Faustino has made flattering speeches to me—scores of them—called me all sorts of endearing names—does so whenever we two are together alone. I only laugh at him.'

'Ah! Faustino Calderon is not Francisco de Lara. They are men of very different characters. In the behaviour of your admirer there's only a little of the ludicrous; in that of mine, there may be a great deal of danger. But let us cease discussing them. There's no time for that now. The question is, are they coming on to the house?'

'I think there can be no question about it; like enough they've heard that we're soon going away, and are about to honour us with a farewell visit.'

'Would it were only that. But visit of whatever kind, 'tis extremely ill-timed, and may be awkward.'

'How so?'

'Supposing they should stay till our English friends arrive? You know 'tis near the hour they were invited to ride out with us. Twelve, father told them, he says. It's now half-past eleven; and if the four should meet here, wouldn't we be in a dilemma? It's very vexatious, the coming of these two cavaliers.'

'Let them come—who cares? I don't.'

'But I do. If papa were at home, I mightn't so much mind it. But, just now, I've no desire to see De Lara alone—and still less while being visited by Don Eduardo. They're both *demonios*, though in a very different way; and sure as fate there'd be trouble, perhaps a fight, between them. That wouldn't be at all pleasant. But, let us hope our friends from the ship won't get here, till our shore-friends—or enemies, I should rather style them—have done their *devoirs*, and gone away.'

'But our ship-friends will be here before that. I declare they're on the way now. Look yonder!'

Iñez points over the bay in the direction of the British frigate, where a boat is in the water under the ship's beam. The sun, reflected from dripping oar-blades, shews that they are in motion. And while the girls continue gazing, the boat is seen to separate from the ship's side, and put shoreward, straight towards the sand-spit which shoots out in front of Don Gregorio's dwelling. The rowers are all dressed alike, the measured stroke of their oars betokening that the boat belongs to the man-o'-war. But the young ladies do not conjecture about that; nor have they any doubt as to the identity of two of the figures seated in the stern-sheets. Those uniforms of dark blue, with the gold buttons, and yellow cap-bands, are too well known, not to be recognisable at any distance to which love's glances could possibly penetrate. They are the guests expected, for whom the spare horses stand saddled in the patio. For Don Gregorio, not displeased with certain delicate attentions which the young British officers have been paying to the female members of his family, has invited them to visit him—ride out along with the ladies, and on return stay to dinner. He knows that a treat

of this kind will be pleasing to those he has asked; and, before leaving home, has given orders for the steeds to be saddled.

It is not the first time Crozier and Cadwallader have been to the Spaniard's house, nor the first to stretch their limbs under his dining-table. But it may be the last—at least while that table is spread in his present abode. For in truth it is to be a farewell visit. But along with this understanding another has been entered into. The acquaintance commenced in California is to be renewed at Cadiz—when the *Crusader* goes thither, which she is ere long expected to do. But for such expectation, Carmen Montijo and Iñez Alvarez would not be so high-hearted at the prospect of a leave-taking so near. Less painful on this account, it might have been even pleasant, but for what they see on the opposite side—the horsemen coming from the town. An encounter between the two pairs gives promise to mar the happy intercourse of the afternoon.

'They'll meet—they must!' says Carmen, speaking apprehensively.

'Let them!' rejoins Iñez, in a tone of non-chalance. 'What if they do?'

'What! They may quarrel. I'm almost sure they will.'

'No fear for that; and, if they should, where's the danger? You, such a believer in the romantic—stickler for old knight-errantry—instead of regretting it, should be glad! Look there! Lovers coming from all sides—suitsors by land and suitsors by sea! No lady of the troubadour times ever saw the like; none was ever honoured by such a rivalry! Come, Carmen, be proud! Stand firm on your castle-keep! Shew yourself worthy to receive this splendid adoration!'

'Iñez, you don't know the danger.'

'There is none. If they should come into collision, and have a fight, let them. I've no fear for mine. If Willie Cadwallader isn't a match for Faustin Calderon, then he's not match, or mate, for me—never shall be.'

'*Sobrina!* you astonish me. I had no idea you were such a *demonio*. The Moorish blood, I suppose. Your words make me almost as wicked as yourself. It isn't for that I'm afraid. I've as much confidence in my lover, as you in yours. No fear that Señor Crozier will cower before Francisco de Lara. If he do, I shall take back my heart a second time, and carry it unscathed to Cadiz.'

Meanwhile, the man-o'-war's boat has been drawing in towards the beach, heading for a little embayment, formed by the shore-line, and the sand-bar already spoken of. The horsemen coming from the town-side do not see it; nor can the crew of the boat perceive them. The land-ridge is between the two parties, its crest concealing them from one another. They are approaching it at a like rate of speed. For although the horses appear to be in a gallop, it is only a fancy gait fashionable among Spanish Californians, its purpose to exhibit equestrian skill. The two horsemen looking up the hill, see two heads on the house-top, and know that ladies' eyes are upon them. Surreptitiously goaded by the spur, their steeds plunge and curvet, apparently advancing at a rapid pace, but in reality covering little ground. At length both parties disappear from the eyes of those on the azotea. They have gone under the brow of the hill, which,

overhanging for a short distance, shuts out a view of the road, as also the strip of sandy shore.

Unseen from above, the man-o-war's boat beaches, and the two officers spring out upon the strand. One of them turning, says something to the coxswain, who has remained in the stern-sheets, with the tiller-ropes held in hand. It is an order, with instructions about where and when he is to attend them for their return to the ship.

'At the new wharf in the harbour,' Crozier is heard to say; for it is he who commands, on account of seniority in rank.

His order given, the boat shoves off, and is rowed back toward the ship; while the officers commence climbing the slope, to get upon the shore-road. At the same time the horsemen are ascending from the opposite side. Soon both parties are again within view of those on the house-top. But neither as yet sees the other, or has any suspicion of their mutual proximity. The crest of the ridge is still between, and in a few seconds more they will sight one another. The men afoot are advancing at about the same rate of speed as those on horseback. The latter have ceased shewing off, as if satisfied with the impression they must have already made, and are now approaching in tranquil gait, but with an air of subdued triumph—the mock modesty of the *matador*, who with blood-stained sword bends meekly before the box where beauty sits smiling approbation. The two pedestrians climb the hill less ceremoniously. Glad to stretch their limbs upon land—shake the knots out of them, as the junior gleefully remarks—they eagerly scale the steep. Not silent either, but laughing and shouting like a couple of school-boys, abroad for an afternoon's holiday.

Suddenly coming within view of the house, they bring their boisterous humour under restraint at sight of two heads appearing above the roof. For they know to whom these belong, and note that the faces are turned towards them.

At the same instant the horsemen also see the heads, and observe that the faces are *not* turned towards them. On the contrary, they are averted, the ladies looking aslant in another direction.

Some chagrin in this. After all their grand caracoling and feats of equestration that must have been witnessed by the fair spectators. At what are these now gazing? Is it a ship sailing up the bay, or something else on the water? No matter what, and whether on land or water. Enough for the cavaliers to think they are being slightly received. Disconcerted, they seek an explanation, mutually questioning one another. Before either can make answer in speech, both have it before their eyes—in the shape of two British naval officers.

Like themselves, the latter have just reached the summit of the ridge, and are coming on towards Don Gregorio's gate. It is midway between; and keeping on at the same rate of speed, they will meet directly in front of it.

Neither pair has ever set eyes on the other before. For all this, there is an expression on the faces of all four that tells of mutual surmises of no friendly nature.

Calderon says to De Lara, *sotto-voce*: 'The English officers!'

Cadwallader whispers to Crozier: 'The fellows we've heard about—our rivals, Ned. Like ourselves, I suppose, going to visit the girls.'

De Lara makes no response to Calderon. Neither does Crozier to Cadwallader. There is not time. They are all close up to the gate, and there is only its breadth between them.

They have arrived there at the same instant of time, and simultaneously make stop. Face to face, silence on both sides; not a word offered in exchange. But looks are quite as expressive—glances that speak the language of jealous rivalry—of rage, with difficulty suppressed.

It is a question of precedence, as to who shall first pass through the gate. Their hesitation is not from any courtesy, but the reverse. The men on horseback look down on those afoot contemptuously, scornfully. Threateningly, too, as if they thought of riding over and trampling them under the hoofs of their horses. No doubt they would like to do it, and might make trial, were the young officers unarmed. But they are not. Crozier carries a pistol—Cadwallader his midshipman's dirk, both appearing outside their uniforms.

For a period of several seconds' duration, the rivals stand *vis-à-vis*, neither venturing to advance. Around them is a nimbus of angry electricity, that needs but a spark to kindle it into furious flame. A single word would do it. This word spoken, and two of the four may never enter Don Gregorio's gate—at least, not alive.

It is not spoken. The only speech is one which passes from Crozier to Cadwallader—not in a whisper, but aloud, and without regard to the effect it may have on the Californians.

'Come along, Will! We've something better before us than stand shilly-shallying here. Heave after me, shipmate!'

Crozier's speech cuts the Gordian-knot; and the officers, gliding through the gateway, advance along the avenue. With faces now turned towards the house, they see the ladies still upon the *azotea*. Soon as near enough for Carmen to see it, Crozier draws out the treasured tress, and fastens it in his cap, behind the gold band. It falls over his shoulder like a cataract of liquid amber. Cadwallader does likewise; and from his cap also streams a tress, black as the plumage of a raven. The two upon the house-top appear pleased by this display. They shew their approval by imitating it. Each raises hand to her riding-hat; and when these are withdrawn, a curl of hair is seen twining over their *toquillas*—one chestnut-brown, the other golden-hued.

Scarcely is this love-telegraphy exchanged, when the two Californians come riding up the avenue at full speed. Though lingering at the gate, and still far off, De Lara has observed the affair of the tresses, and understood the symbolism of the act. Exasperated beyond bounds, he can no longer control himself, and cares not what may come. At his instigation, Calderon spurs on by his side, the two tearing furiously along. Their purpose is evident: to force the pedestrians from the path, and so humble them in the eyes of their sweethearts. On his side, Crozier remains cool, admonishing Cadwallader to do the same. He feels the power of possession: assured by those smiles, that the citadel is theirs. It is for the outsiders to make the assault.

'Give a clear gangway, Will,' he says; 'and let them pass. We can talk to the gentlemen afterwards.'

Both step back among the *manzanita* bushes, and

the *ginetes* go galloping past; De Lara on Crozier's side scowling down, as if he would annihilate him with a look. The scowl is returned with interest, though the officer still reserves speech. On the other edge of the avenue the action is a little different. The midshipman, full of youthful freak, determines on having his lark. He sees the chance, and cannot restrain himself. As Calderon sweeps past, he draws his dirk, and pricks the Californian's horse in the hip. The animal, maddened by the pain, bounds to one side, and then shoots off at increased speed, still further heightened by the fierce exclamations of his rider, and the mocking laugh sent after him by the mid. Under the walls the two horsemen come to a halt, neither having made much by their bit of rude bravadoism. And they know they will have a reckoning to settle for it—at least De Lara does. For on the brow of Crozier, coming up, he can read the determination to call him to account. He is not flurried about this. On the contrary, he has courted it, knowing himself a skilled swordsman and dead shot. Remembering that he has already killed his man, he can await with equanimity the challenge he has provoked. It is not fear has brought the pallor to his cheeks, and set the dark seal upon his brow. Both spring from a different passion: observable in his eyes as he turns them towards the house-top. For the ladies are still there, looking down.

Saluting, he says: 'Doña Carmen; can I have the honour of an interview?'

The lady does not make immediate answer. A spectator of all that has passed, she observes the hostile attitude between the two sets of visitors. To receive both at the same time will be more than embarrassing. With their passions roused to such a pitch of anger, it must end in a personal encounter. Her duty is clear. She is mistress of the house, representing her father in his absence. The young officers are there by invitation. At thought of this, she no longer hesitates.

'Not now, Don Francisco de Lara,' she says, answering his question; 'not to-day. We must beg of you to excuse us.'

'Indeed!' rejoins he sneeringly. 'Will it be deemed discourteous in me to ask why we are denied?'

It is discourteous; and so Doña Carmen deems it. Though she does not tell him as much in words, he can understand it from her reply.

'You are quite welcome to know the reason. We have an engagement.'

'Oh! an engagement!'

'Yes, sir, an engagement,' she repeats, in a tone telling of irritation. 'Those gentlemen you see are our guests. My father has invited them to spend the day with us.'

'Ah! your father has invited them! How very good of Don Gregorio Montijo, giving his hospitality to *gringos*! And Doña Carmen has added her entreaties, no doubt?'

'Sir!' says Carmen, no longer able to conceal her indignation, 'your speech is impertinent—insulting. I shall listen to it no longer.'

Saying this, she steps back, disappearing behind the parapet—where Inez has already concealed herself, at the close of a similar short but stormy dialogue with Calderon.

De Lara, a lurid look in his eyes, sits in his saddle as if in a stupor. He is aroused from it by

a voice, Crozier's, saying: 'You appear anxious to make apology to the lady? You can make it to me.'

'*Carrai!*' exclaims the Creole, starting, and glaring angrily at the speaker. 'Who are you?'

'One who demands an apology for your rude behaviour.'

'You will not get it.'

'Satisfaction, then?'

'That to your heart's content.'

'I shall have it so. Your card, sir?'

'There, take it. Yours?'

The bits of pasteboard are exchanged, after which De Lara, casting another glance up to the azotea—where he sees nothing but blank wall—turns his horse's head, and, spitefully plying the spur, gallops back down the avenue—his comrade closely following.

Calderon has not deemed it incumbent upon him to ask a card from Cadwallader. Nor has the latter thought it necessary to demand one from him. The mid is quite contented with what he has done with his dirk.

The young officers enter the house, in cheerful confidence that they have lost nothing by the encounter, and that those inside will still smilingly receive them.

#### NEW TREASURES AT THE BRITISH MUSEUM.

YEAR after year, a vast amount of treasures, interesting as well to the ordinary sight-seer as to the student in every department of human knowledge, is added to the various collections comprised within the walls of our great national storehouse in Bloomsbury, and certainly 1874 does not fall behind its predecessors in either the number or the value of the objects added by donation and purchase. Premising that the number of visitors to the British Museum is steadily increasing, having been 601,843 during the year, or 25,724 more than in 1873, and 53,349 more than in 1872, we proceed to take a brief survey of the progress made in the period referred to, as shewn by the Return published by order of the House of Commons.

In the Department of Printed Books, the number of distinct works comprised in the 37,761 volumes and pamphlets and 40,663 parts of volumes added to the book-shelves, amounted to about 39,800. Besides these, 10,351 articles have been received, including play-bills, single pieces of music, broadsides, songs, and ballads, parliamentary papers, &c. The number of sets of newspapers published in the United Kingdom, and received under the provisions of the Copyright Act, during the past year, has been as follows: 252 published in London and suburbs, 1110 in other parts of England and Wales, 170 in Scotland, and 133 in Ireland. Mr W. B. Rye reports several valuable acquisitions in this department. Many early English works of rarity have been purchased, including a copy of the extremely scarce first edition of Lydgate's translation of Boccaccio's *Fall of Princes*, printed by Pynson in 1494. This volume was rescued from a tobacconist's shop at Lambeth; portions had been cut out to wrap up

tobacco and snuff. The rare edition of the English Bible in octavo, printed in 1612-13, the year after the publication of the authorised version in folio. It was unknown to Dr Cotton, Lea Wilson, and to Lowndes. It is in beautiful condition, and in a binding of embroidered needlework. *Psalms, Hymns, and Spiritual Songs of the Old and New Testament, in English Meter for the Saints, especially in New England*, 1680. Twenty rare Scotch proclamations and other documents of the seventeenth century. Some scarce works of Percy Bysshe Shelley, including the *Refutation of Deism*, of which only two other copies are known to have occurred. A further selection of about five hundred works from the linguistic library of M. Burraud des Marets, comprising works in Basque, in the dialects of Italy, Spain, and Portugal, and in Walachian. This purchase has made the Museum library exceedingly rich in Basque books. The collection of music has also been augmented by the purchase of several hundred volumes, comprising the works of modern German, French, and Italian composers, many in full score. A great number of important treatises on the theory of the art have been acquired, and several valuable additions made to the class of early printed music. The Map Department has acquired, among other curiosities, an anonymous map of Germany and the surrounding countries, engraved on copper, but with the lettering printed from type, published at Eichstatt, in Bavaria, in 1491. In a legend at the top describing the contents, occur the words: 'Gratia sit Cusæ Nicolao,' shewing it to be the surviving representative of an early map, now unknown, made by Cardinal Nicolas Krebs (called Cusanus, from his native village of Cusa, on the Moselle), who died in 1461. On the back of the map is a drawing of a coat-of-arms, headed by the name of the illustrious Willibald Pirckheimer (the Xenophon of Nuremberg), with the date 1529. From this, it may be inferred that he had this identical map before him when he wrote his *Germaniæ ex variis Scriptoribus perbrevis Explicatio*, published in Nuremberg in 1530.

The Department of Manuscripts is not very generally availed of by students, for the number of visitors in 1874 was but 1632, against 1345 in 1873; 22,957 manuscripts, however, were delivered in the reading-room in the year, these being, we presume, of a less valuable character than the 1902 consulted in the rooms of the department. The number of acquisitions is somewhat less than in the previous year, but many are of considerable importance and interest. For instance, forty-nine volumes of Correspondence and Papers of Christopher, first Viscount Hatton, and Daniel Finch, second Earl of Nottingham, Secretary of State in the reign of Queen Anne. The earlier portion, we are told, comprises much that relates to affairs of the isle of Guernsey, of which Lord Hatton was governor, together with extensive family correspondence, and volumes of letters of Sir Charles Lyttelton, Dr Fell, Bishop of Oxford, Dr Edmund King, and others. The latter portion principally consists of letters from ministers at foreign and other public offices, including Lord Treasurer Godolphin, Sir Joseph Williamson, Sir Paul and John Methuen (in Spain and Portugal), the Duke and Duchess of Marlborough, the Duke of Ormonde, Dr Jeremy Taylor, and other persons of note. Original letters of Jean Jacques Rousseau

and David Hume, and other papers connected with Rousseau's residence in England and his quarrel with Hume (1766-69). Stanzas by Lord Byron, in his autograph, accompanied by his letter offering them for publication in the *Monthly Literary Recreations*, dated 21st July 1807.

Thirty-six manuscripts have been added during the year to the Oriental Collection—namely, thirty by purchase, and six by donation, as follows: Arabic, 12; Persian, 10; Japanese, 4; Hindu drawings, 4; Syriac and Hebrew, 2 each; and Sanscrit and Pali, 1 each. The more interesting of these are: A Journal of the Japanese Mission to Europe (*Japanese*), six parts, folio; a Japanese Novel, with miniatures, quarto (both these manuscripts were presented by Ernest M. Satow, Esq., Japanese secretary to the British legation at Yedo); and a large Buddhistic work, written on palm leaves, in the Pali language and Cambodian character, presented by Dr Campbell, R.N., Surgeon to H.M.'s Consulate General, Bangkok, Siam (erroneously described by the Museum authorities as 'Her Majesty's Consul General, Siam').

The number of objects acquired by the Department of Oriental Antiquities, including fragments, was about 3200. Among these are a considerable collection of Assyrian antiquities, obtained from the excavations carried on in Mesopotamia by Mr George Smith, by order of the Museum trustees, in 1873 and 1874; a wooden board of a coffin, on which is painted Merartef worshipping Socharis (presented by C. W. Goodwin, M.A., Assistant Judge of H.M.'s Supreme Court for China and Japan); terra-cotta jug in shape of a female head, and another moulded in the form of a pigeon; a white jasper oval, with magical inscription; &c.

Many interesting objects have been added, by donation and purchase, to the Department of Greek and Roman Antiquities, among which may be mentioned the following: terra-cotta figure of Venus riding on a swan, from Canteras del Puiz, in Spain; five Athenian *lektythi* of fictile ware, with polychrome designs on a white ground, on one of which is represented Charon in his boat beckoning towards a female figure beside a *stelé*, while on three are representations of mourners bringing offerings to tombs; a pair of gold ear-rings, remarkable for the richness of their decoration, and their great size (found in Granada, Spain); two alabaster vases, one of which is of the peculiar funnel shape only met with in the archaic fictile wares of Ialysos and Santorin; sepulchral *stelé* of Demetrios, son of Pancrates, with Greek inscription in verse (from Amyzon, in Caria). We extract the following remarks by Mr C. T. Newton, in regard to excavations at Ephesus: 'Mr Wood has completed the exploration of the site of the Temple of Diana, and the remainder of the marbles discovered by him have been received. In demolishing the walls of Byzantine masonry built against the *cella* walls of the Temple, a number of fragments of architecture and sculpture from the Temple were found. In some places it was discovered that the foundations of this Byzantine masonry rested on ancient pavement, the level of which was intermediate between the levels of the two pavements previously discovered—that is, nearly four feet above the lowest pavement previously discovered, and about three feet six inches below the uppermost step of the latest Temple. On the south side of the site were discovered the

remains of a Doric building, which is probably of the same period as the latest Temple. The excavations were extended on the west without yielding any remains of the Temple; on the east was found an *akroterion* from the roof of the Temple. In the exploration of the cella, a number of archaic fragments of sculpture were found. In several places the diggings were carried down to the original foundations of the earliest Temple, below which was a layer of charcoal distinctly visible. The presence of this layer confirms the statements of Pliny (*Natural History*, xxxvi. 21) and Diogenes Laertius (ii. 8, 19), that the foundations of the Temple were laid on a bed of charcoal and fleeces of wool, an expedient which was probably adopted to prevent the damp rising. After the site of the Temple and the margin of soil immediately adjoining it had been completely explored, the excavations were brought to a close in March 1874.

The Department of British and Medieval Antiquities and Ethnography has again this year acquired many curiosities, which are classed under various headings. Among the more noteworthy are an elaborately carved Chinese glass vase, imitating in colour a sapphire; an ancient Chinese jade vase, found in a tomb near the great wall of China; a Chinese steatite seal, which belonged to the notorious Commissioner Yeh, of Canton; a model of a boat made in cloves, from the Asiatic Archipelago; and a Chinese shirt of rattan—the last two being presented by Mrs Butterworth. The Christy Collection has received several donations, of which, in view of recent events, perhaps the most interesting are the kava bowl of Thakumbau, king of Fiji, and a very large Fiji club. From the fact of this collection being still retained at 103 Victoria Street, Westminster, and being only open on Fridays by means of tickets obtained at the British Museum, there have only been 858 visitors to inspect it during the year, or six less than in the previous twelve months.

The acquisitions in the Department of Coins and Medals number 1525, consisting of Greek, Roman, medieval, and modern English and Oriental coins, classed as gold, silver, copper, billon, and glass.

Professor Owen has even a more flourishing account to give of the additions to the Departments of Natural History during the period under review, than he had a year ago. The aggregate number of specimens added in 1874 is 34,616, against 30,424 in 1873. Of these, 30,699 have been registered in the Department of Zoology, 3103 in that of Geology, and 814 in that of Mineralogy. It would be impossible to notice in detail the numerous acquisitions in the Zoology Department, but two matters are worthy of especial mention, the one under the head of *Birds*, and the other under that of *Insecta*—namely (1), the type of a new pheasant (*Lophophanes Buhleri*) from the interior of Borneo, presented by His Excellency the Governor of Labuan, Sir Henry Bulwer, and named after the donor. 'This,' Dr Gunther remarks, 'is one of the most interesting additions that have been made for some years past to our knowledge of birds. It is a bird rather above the size of the common pheasant, and with skinny wattles on the naked head, which are probably of a bright blue colour during life. The body, which is entirely of a deep black colour (each feather having a glossy margin),

terminates in a long lyre-shaped, snowy-white tail.'

(2) A most important acquisition has been made by the purchase of Mr Edward Saunders' collection of *Duprestidae*, a group of beetles, which, by the beauty of their colours, as well as by the manifold modifications of their form, have always attracted the attention of scientific entomologists and amateur collectors. Mr Edward Saunders having made this group his especial study for many years, had brought together a collection of 7267 specimens in the most perfect state of preservation, which, with the exception of a very small proportion, were named, many from comparison with the types in continental museums. The amalgamation of this collection with the one previously existing in the British Museum has raised this part of the Entomological Collection to a condition of unrivalled completeness. Under the head of *Radiata* (and *Vermes*) the most notable presents are two magnificent tree-like corals (*Antipathes*) from the Bermudas and the Samoa Islands: the former from Dr Hooker, C.B., P.R.S.; and the latter from H. R. Williams, Esq.

In the Department of Geology, 8920 new specimens were registered in 1874, while the additions to the collection of minerals are described as 'valuable rather than numerous.' Mr Story-Maskelyne reports the acquisition, among other treasures, of a large deep yellow sapphire, faceted; a colourless sapphire, also faceted; a bright little faceted specimen of hyacinth from Ceylon; a large crystal of kieselophane from Krageroe, Norway; specimens of precious opal, associated with ferruginous sands and jasper, Baracoo River, Queensland, Australia—one of them, a cut specimen remarkable for its fire and the dark colour of the matrix; precious opal with native gold, Czerwenicza, Hungary; and a very large cavernous mass of botryoidal pale sard, from India.

The Department of Botany has received many additions in its various subdivisions, and several British and foreign botanists of eminence have used the Herbarium in prosecuting their various studies.

In conclusion, we have only to call attention to the Department of Prints and Drawings. Considerable progress, we find, has been made with the third volume of the Printed Catalogue of Satirical Prints and Drawings; all the works of Hogarth have been described, and the allusions in which they abound exhaustively explained; in this respect the catalogue will probably leave nothing to be done, and will represent Hogarth completely. The catalogue of other works is practically finished up to the year 1743, including many hundreds of entries; and numerous later examples have also been described. No less than 11,381 acquisitions have been made in this department during the year, including many valuable presents. The most important examples acquired by purchase have been selected from the fine collection formed by Hugh Howard, an eminent connoisseur, at the commencement of the last century; at his death, in 1737, the collection was removed to Ireland, where it remained without being in any way interfered with, until its sale, in two portions, in December 1873 and November 1874; from each division, previous to its sale, the Museum authorities were permitted to select whatever specimens were required for the department. Finally, under the head of Engravings of the English School, we

learn that the nation has become possessed of an extremely interesting woodcut in three blocks, representing the *Ark Royal*, the largest vessel in Queen Elizabeth's navy, and the flag-ship of Lord Howard of Effingham in the battles with the Armada. She carried fifty guns, and was of eight hundred tons burden. In the woodcut she is represented as rigged with four masts, and carrying the admiral's standard at her gangway, thus continuing the custom, which obtained in ancient as well as medieval times, of exhibiting the armorials of the warriors on board a vessel, on shields suspended at her sides; the royal standard flies at her mainmast head; the Tudor rose is on a flag at the summit of her mizzen-mast, and a St George's Cross appears at her foremast truck. This woodcut, if it is of English origin, is one of the oldest works of the kind executed in this country.

#### AN ADVENTURE IN IRELAND.

THE winter of 1867 was a severe one in Ireland, and the poor misguided Fenians who spent hours and hours shivering on the bare hill-sides of Kerry or the bogs of Athlone must have had a hard time of it. While marching and countermarching, the cold might be endurable; but when it came to listening to a speech for two hours at a time—and, unfortunately, the Fenians were very fond of speaking, and very averse to action—it must have cooled down the ardour of a good many of the patriots.

I was not a Fenian, I need hardly say, nor had I any sympathy whatever with them. I was—and in fact am—an officer in Her Majesty's — Regiment, and only happened to be in Ireland at that time on a short leave of absence. Though an Irishman by birth and education, I am not politically bilious, nor nationally dyspeptic, nor have I 'a grievance'—and I believe I am about the only Irish gentleman I know who can say as much. We have always been a loyal family; our ancestors for generations distinguished themselves for unwavering fidelity to their sovereigns; represented the family borough in parliament in the Tory interest, and were hereditary deputy-lieutenants and justices of the peace. I reached home two days before Christmas eve, to find my father and mother both away, and learned that they would not be back for three or four days. It was a sad disappointment; but as my coming was meant for a surprise, and about the most unexpected event that could possibly happen, I could hardly blame them. The first day, I spent roaming over the house and stables, and in the evening I idled over my dinner, and yawned over a novel afterwards. A great gloomy country-house, with no one in it but yourself, is not the pleasantest place in the world to spend a long December evening.

The next day it rained as it only can rain in the south of Ireland—with a calm, deliberate, dogged perseverance; and I sat at the window and watched the unceasing drip-drip from the leaves of the laurustinus and holly, and smoked as persistently almost as the rain descended. The next morning,

just as I was entertaining seriously the notion of returning to London by the next mail from Limerick, a note was brought me from Sir William Ayr, asking me to dine with him that evening. Sir William was the father of Captain Ayr, a brother-officer, and I was delighted at the prospect of renewing my acquaintance with the old gentleman, who used to 'tip' me royally when I was a schoolboy. I had not seen him for seven years; and as I dressed for dinner, I remembered that Sir William had some daughters, who promised to be very charming girls when I last saw them. Therefore, I dressed with more than usual care; and putting on a frieze greatcoat, for the night was intensely cold, I mounted Comet, my father's favourite chestnut, a magnificent thorough-bred, and at six o'clock started for Glenloe, Sir William's residence—a ride of eight Irish miles, through that bleak and desolate stretch of country where the county Limerick adjoins the county Clare.

I had not got more than three miles from home, when I suddenly pulled up my horse and listened, for I heard the most heart-rending groans imaginable, which seemed to proceed from a neighbouring field. Riding on a little, the cries sounded nearer, and then I felt sure that they came from some one lying a little way up a narrow lane just before me. I listened a moment, and then, urged by a sort of curiosity, I dismounted, and tying my horse to a tree, went on a voyage of discovery. I had not gone more than two dozen yards when I stumbled over the body of a man lying across the path.

'Hollo!' I said, 'what's the matter?'

'Och, *mille murther*; don't, yer honour, don't touch me! Shure, I'm a decent boy. Oh! Oh!'

'What's the matter?' I again asked. 'Are you hurt?'

'There's not a bone in me body that isn't broke, yer honour. Me two eyes is druv into one, an I'm black an blue all over. It's them blagourd Fenians, sur.'

'How—when?' I said. 'What's your name?'

'Michael Hennessy, sur; an I was comin home from the fair of Killaloe, when four men came from behind a hedge, an knocked me down, took all me money, an beat me till they left me for dead. Oh! Oh!'

'Don't howl so dismally, man. You're not dead yet, nor anything like it. Stand up, and try if you can walk,' I said. 'Do you live far from here?'

'Not very, yer honour; an I feel aisier now, since you spoke to me. O wirra, wirra, sir!'

I helped the fellow to his feet, gave him a small flask of brandy I had in my pocket, and saw him safely over the stile on his way home, and then returned to where I had left my horse. To my intense surprise and dismay, I found Comet, my father's pet chestnut, gone, and a miserable knock-knee'd skeleton gray mare shivering in his place. The wretched beast was cropping the grass by the

roadside, and every now and then he gave his head a toss, in a way peculiar to Irish cart-horses, with a partiality for trespassing on some farmer's clover. I walked up and down the road, and glanced over the hedges, but Comet was nowhere to be seen, though what could have become of him puzzled me. Presently I heard an 'halloo!' from the field in the direction Hennessy had gone.

'Is it the chestnut yer looking for, yer honour?'

'Yes,' I replied at the top of my voice. 'Where is he?'

'Faix, I wouldn't wonder if one Captain Casey took a fancy to him, an while yer honour was talkin to me, borrowed the loan of the baste. Good-night, sur, an a pleasant journey to ye on ould Curran's gray mare.' And I just caught the echo of a derisive laugh from the field. It was not in a very pleasant temper that I mounted the old hack and proceeded in the direction of Glenloe, mentally resolving to say nothing of my adventure. That I had been swindled in the simplest way imaginable by a clever but transparent trick, I saw plainly, but I resolved to make the best of it, and account for the disappearance of Comet as best I could. Not blessing the land of my forefathers, and declaring, in no very measured terms, that the Island of Saints was the most delightful one in the world 'to live out of,' I got a few miles farther on my journey, when I was again brought to a stand-still; this time, by about a dozen policemen drawn up across the road. I attempted to pass, but the sergeant very deliberately laid his hand on my arm, and said in measured tones: 'I arrest you, in the name of the Queen.'

'Arrest me!' I cried. 'What for?'

'Treason felony is the indictment in the warrant issued for your apprehension,' one of the men said, slapping me on the shoulder; while another, with a dexterity which puzzled me then, and has continued to do so till this day, slipped a pair of handcuffs on my wrists.

'Where is the warrant?' I asked.

'Safe enough, I warrant,' the sergeant said with a dry little laugh; 'and even if we hadn't that valuable little bit of paper, we would take the liberty of looking after your interests under the Suspension of the Act, all the same. Come along, captain.'

So far I had been perfectly good-tempered, and treated the matter as a joke; but I was soon thoroughly vexed, for I was only a lieutenant at that time, and I resented the sarcasm of the broad-shouldered sergeant of the Royal Irish Constabulary.

'Now look here,' I said; 'I am not going to stand any more of this nonsense; it is going beyond the limits of a jest. Allow me to pass.'

'Come on, sir.—Fall in, men; and in a moment they had formed a square round me with fixed bayonets. I remonstrated, and told them angrily who I was, and where I was going.

'On your way to dine with Sir William Ayr, indeed! Very like a whale that, captain, but not quite so large, you understand!' the sergeant said jeeringly. 'But if it's all the same, you'll dine at

the Queen's expense instead. Don't try to be after humbugging us, my boy! it won't do.'

'But I tell you I am Lieutenant O'Gorman, just come home to see my father at Cross House. You must know Squire O'Gorman,' I cried, losing all patience.

'Now, listen here, captain. We know the squire all right; and Mr Ulic, his son, passed this way twenty minutes ago, riding Comet, that we know on the road better than our own shadows: no fear of our mistaking the chestnut. So come on, and no more nonsense.'

'Come home with me, and ask any one; they will soon satisfy you as to my identity,' I urged.

'Now, captain, do you think I am a bigger fool than I look, or do I look a bigger fool than I am? We have been waiting for you and this same gray mare for three mortal hours, and it is not likely that we are going to walk five miles out of our way to give you a chance of escaping. We have netted you very nicely, and I have no doubt but we will find something valuable on you when we come to search by-and-by.'

'Well,' I said, as a last resource, 'let us call at Sir William's, and if Lieutenant O'Gorman is there, I'll give in.'

'Now, what on earth is the use of bothering, captain? Didn't I tell you I saw Mr Ulic ride by on Comet. I spoke to him, and he answered me. Why continue the delusion with me?'

'But I have Sir William's invitation in my pocket,' I said, after vainly attempting to tell how Comet had been stolen: every time I began that story, I was greeted with roars of sarcastic laughter.

'I'll try and find the invitation, captain; but that will prove nothing, as strange things are often found on strange customers like you—but it's not convenient all the same,' the sergeant added.—'Come on, my boys; quick march! it's cold work idling here.'

In sheer desperation, I resigned myself to my fate, and in sullen silence continued my journey towards Limerick, not even condescending to ask who I was supposed to be. On passing the gates of Glenloe, I begged the sergeant to send one of the men up to ask if Captain Ayr was at home, and if he would come and speak to me; which he consented to do, desiring the man also to ask if Lieutenant O'Gorman was there.

In ten minutes he returned, and told the sergeant that Captain Ayr had not come home, but that the lieutenant was there—just gone in to dinner.

'Now aren't you the coolest and most unblushing villain unhung?' the sergeant asked quietly. 'I believe you would have the impudence to meet a gentleman, and tell him to his face that he wasn't himself. Perhaps you will come on peaceable now, captain?'

I nodded an assent, and we continued our march. It was bitterly cold, and I was growing hungry and tired. I resented the snail's pace at which I had to ride; but most of all, I resented the remarks of the men as to my dodges and impudence, and their supposed softness. We reached Limerick at last, and I hoped the magistrate, or whoever I would be brought before, might be possessed of a little common-sense; but, alas, it was ten o'clock when we reached the 'beautiful city;' and instead of magistrate or police inspector,

I found myself 'run in' to the county jail, where I stormed, and raved, and threatened, and at last asked who I was.

'Captain William Casey, Fenian Centre, at your service,' the turnkey said. 'Would you like to see your likeness?' And taking up the *Hue and Cry*, he read the following description: 'William Casey, height five feet ten inches, blue eyes, brown curly hair, dark whiskers and moustache, white even teeth; last seen in evening dress, wearing white tie, gold studs, sleeve-links, and chain—a gray frieze overcoat, and white muffler round his neck. L.100 reward for his capture, or information that will lead to his capture.'

I read the description over, and then looked at myself, and turned away with a sigh, and the settled conviction that I could never be certain of my own identity again; I might be Ulic O'Gorman, but equally I might be Captain Casey, or any one else. There was my photograph in the *Hue and Cry*, perfect in every detail. I lay on the floor and tried to laugh at myself, but the effort was a miserable failure. I then tried to think over all the events of the evening calmly, but the effort was impossible; and at last, utterly weary in mind and body, cold, hungry, and thirsty, I lay on my wretched little bed and fell asleep.

The first experience of prison-life is not usually considered agreeable, yet I have no fault to find with Limerick jail, for I slept soundly and dreamed pleasantly till ten o'clock the next morning, when I was roused by voices in my cell, and hearing my name mentioned in a familiar voice, I opened one eye and saw several gentlemen I would have called friends had I been myself, but being somebody else, I did not make any advances, but watched them calmly.

'Hollo, Ulic!—are you awake? Rouse up, old fellow,' Captain Ayr said, shaking me.

I raised myself on one elbow, and examined him. 'You know me?' I said somewhat curiously.

'Know you, Ulic? What an absurd question. What do you mean?' Captain Ayr said. 'Of course I know that you are Ulic O'Gorman.—Lieutenant in "ours."'

'Then you know more than I do,' I replied. 'Last night, I was morally convinced that I was Captain William Casey: I had it, I assure you, Walter, on the best authority.'

'Don't be a fool, Ulic, but get up and come out of this den, and we'll explain everything. It has been rather awkward for you, but it is an uncommonly good joke.'

'It may be, but I do not quite see it,' I replied, as I followed Captain Ayr out of the cell, while the turnkey tried to hide his diminished head as we passed. Outside, we found my father, Sir William Ayr, the county inspector, and several other dignitaries of the law; and many confused explanations followed, to which I listened patiently. It appeared a ridiculously improbable story, but that it was true I knew only too well. Captain William Casey's servant, who was no other than the rascal Hennessy, was a brother to my father's butler, and from him they learned my movements. Casey, knowing that he was suspected of being in the neighbourhood, and closely watched, formed the plan of stealing Comet, which he did while I was speaking to his servant, quietly leading the horse to a safe distance, and then mounting him. He passed the patrol of police without suspicion, and on reaching Glenloe,

asked at the lodge if Captain Ayr had returned; on the keeper replying in the negative, he rode boldly up to the house, and introduced himself as Lieutenant O'Gorman, relying on the fact of my long absence from home, and his remarkable likeness to me, for escape from detection. He had learned many things about our family from his servant, and made a most favourable impression on Sir William and his family. But about ten o'clock there was a sound of wheels and a ringing of bells, and Captain Ayr arrived most unexpectedly. After he had spoken to his family, he asked for O'Gorman, and then the lieutenant was missed. Sir William supposed that he had gone into the garden or conservatory to smoke a cigar; but when half an hour passed, and he did not return, they began to feel uneasy; and on questioning the servants, they learned that he had gone—not on Comet, but on one of Sir William's horses.

'It's most extraordinary,' the captain said; 'I never knew Ulic do such a thing before.—Hollo! what's this?'

On the drawing-room table, placed there by some mysterious agency, lay a card with the words written in pencil: 'Captain William Casey, with compliments, and thanks for a pleasant evening.'

'In a moment,' said Sir William, 'I saw what the dodge was; and at five o'clock this morning we drove over to where your father was staying, and explained the circumstance to him, and then came on here, to get you out.'

And Captain William Casey? I asked.

'Escaped, by George! got clean off: no trace or tidings of him anywhere,' cried Captain Ayr. 'He is about the cleverest and most audacious villain I ever heard of.'

'Well,' I said, 'I don't know what you local authorities think of the Royal Irish Constabulary, but it seems to me that they just a trifle overdo the thing. I would much rather Captain Casey spent Christmas eve in Limerick jail than Ulic O'Gorman.'

Never mind, my boy; you will laugh at this adventure some time,' said my father. I thought it possible, but not very probable, and it has taken me seven years to see the joke.

'Do you know, Ulic, I can't help admiring that Casey,' Captain Ayr said. 'It was a daring thing of him to come and pass himself off for you; and he did it well too, old fellow. My sister Julia was loud in his praises, last night. But come along; the sooner we all get to Glenloe the better.'

'It seems to me that I am about the greatest sufferer so far,' said Sir William ruefully, as we drove up the avenue. 'Captain Casey is a capital judge of horse-flesh, if he is nothing else. I believe, O'Gorman, your father's chestnut is about the best animal in the county; but if there is a better, it's my roan mare Firefly that Casey has taken.'

'It's so Irish,' I said, 'so essentially Irish, from beginning to end, and so absurd, that I can't for the life of me help laughing. The idea of an officer in "ours" being arrested for treason felony—it's a rare joke.'

'Especially the appropriating of my Firefly,' interposed Sir William. 'Still, looking at it what way you will, there is a humorous side to it. Who but an Irishman would risk his liberty for the sake of a practical joke!'

'And who but an incorrigible Irishman would

play the good Samaritan under such circumstances as Ulic did!" said my father.

"And certainly, no one but an Irishman would take it as well as O'Gorman does," cried Walter. "But let us change the subject. Sometime or another, we will have a hearty laugh at the events of last night."

Nearly seven years have passed away, and as I write this, Julia, my wife, is looking over my shoulder, my eldest boy is making frantic efforts to climb on to my knee, while a tiny little Julia is running a fearful risk of having her neck broken by her uncle Walter, now Colonel Ayr; and I am really a captain, and can afford to see the joke of that Fenian adventure, and relate it too.

### ABOUT GAS-METERS.

PROCEEDINGS which have lately taken place in our courts of law between gas consumers and the gas companies have shewn the utter ignorance of the public in the nature and action of the gas-meters, which in many cases are alleged to register falsely for the consumer, or are wilfully misread by the inspectors and collectors. If such is the case, the following observations, gathered from accredited sources, may prove of service.

There are many makers of gas-meters, and these are known by different names, such as, the Wet, the Dry, the Unvarying, Water-line, the Fountain, the Compensating, and the like. Much controversy has also arisen at different times as to which are preferable, the wet or dry meters; but hitherto, the wet have been the most generally used. They are called wet meters on account of water being used to regulate the size of their measuring chambers, which are inserted in a round metal drum, and as one of these chambers is being filled with gas, another chamber previously filled, is being emptied. As the gas is being used, however, the drum revolves, and this carries motion to the index, which registers in cubic feet the gas that has passed through the chambers, whether burned or otherwise wasted. A great deal of gas often passes through the meter which is not consumed, but is wasted in various ways.

Above the index there is another little drum, called an indicator. This is never used in taking the state of the meter, but to check waste or detect the escape of gas; and by it, any gas-fitter who thoroughly understands his business can find out in a few minutes whether or not there is an escape of gas from any of the pipes connected with the meter.

With regard to meters, dry ones require no regulating, and it is not a matter of great importance in what part of the premises they are placed; but all wet meters should be arranged so as to be below the level of the pipes carrying gas to the burners, and in a moderately cool place, for if too warm, a vapour will arise from the water in the meter, and ascend into the pipes with the gas, causing those jumping lights which we all have at times observed. The same kind of jumping is also

liable to take place if the pipes are laid below the meter, or badly laid, owing to water getting into the pipes, if the drum be overworked. Neither should a wet meter be placed in an exposed situation, where it would be liable, in winter, to freeze. Should, however, the water in a meter become frozen, the only way to thaw it with safety is to pour boiling-water into it till the object be attained.

To regulate the meter with water, the gas from the main tap must be turned off. The tap of one of the burners nearest the meter should also be turned on, to let out the air in the meter, that the water may more readily be poured into it. This being done, take out the bottom and top screws, pour water in at the place of the top screw till it runs out at the lower screw. Let it drain dry, then pour more water in, and let it drain a second time. Then put in both screws, and the meter will be in perfect order, and the gas will burn more clear and brilliant than when short of water. It has been sometimes found necessary, in order to get a good light, to take out the lower screw after the gas has been burning, some time after refilling, to drain off any small quantity of water that may have been thrown into the outer case by the revolution of the drum, as is not unfrequently the case, especially if the meter is hard-worked.

But although now scarcely a house of any size is without a meter, a writer in the *Leigh Chronicle* truthfully observes, that "if we were to take the average of gas consumers in the country, perhaps we should find that fully eighty per cent. of those who burn gas are unable to read their meters." But every man, and, for the matter of that, lady too, who consumes gas, ought to be able to read the meter, and to keep a check against the gas company, if for nothing else, for the sake of the honesty of the company's servants; just as the tradesman ought to examine every invoice of goods received from his wholesale merchant.

The dial index (the key to the gas used) is easier to understand than is generally supposed. Most meters have three dials; large ones have four; and very small meters have only two dials. Those with three dials, however, except in factories and large establishment, are most frequently used. The pointer or index-hand of the right-hand dial moves in the same direction as the hands of a watch—from right to left; that of the dial next to the left moves in an opposite direction; while on the third or left-hand dial the pointer or hand moves in the same direction as the first. The figures on the dial—1 2 3 4 &c.—of course shew which way the hand turns. When a meter is new, all the fingers or pointers of course stand upright to start fair; but as soon as gas enters for the purpose of burning, the pointer of the third or right-hand dial begins to move from the figure 0 to the figure 1, and when it has arrived at that figure, it shews that one hundred cubic feet (scale at which gas is sold) have been consumed. If you look at

your meter, you will observe that over the dials is the word 'cents,' which means 'hundreds;' and under the right-hand dial is the word 'units,' meaning 'hundreds of units of cubic feet;' under the second dial is the word 'tens,' meaning 'hundreds of tens of hundreds of cubic feet;' under the third dial is the word 'hundreds,' meaning 'hundreds of hundreds of cubic feet;' and in a four-dial meter, under the left-hand dial is the word 'thousands,' meaning that it measures hundreds of thousands of cubic feet of gas. Or, to make the matter still more plain, let it be remembered, that as the pointer of the right-hand dial moves from figure to figure, it means that an additional hundred feet of gas have been burned. When it moves to the figure 3, it shews that three hundred feet have been burned; when it points to 4, it shews that four hundred feet have been consumed; and so on. But now, mark: when this third dial with its pointer has made the complete revolution of its disc, and stands at the upright position from which it started, the pointer of the second dial begins to act as a multiplier, and the second dial indicates the figure 1; shewing that one hundred tens, or, in other words, one thousand feet of gas have been burned. When this pointer arrives at the figure 2, it shews that two thousand feet have passed through and been burned; and so on; and when this pointer has made one entire revolution, the pointer on the third or left-hand dial will have arrived at figure 1; shewing that ten thousand cubic feet of gas have passed through the meter, &c.

The way, then, to read your meter—and all meters are read alike—is to begin at the left-hand dial, and read forward, as you would a book. If the pointer stands, say, between the figures 6 and 7, put down the figure the pointer has last passed, which will be the figure 6; if that on the middle dial stands between the figures 7 and 8, put down the lowest figure, 7; and if the pointer on the right-hand dial stands, say, at the figure 5, put down the figures 500. You will then have the figures thus: 67,500; shewing that that number of cubic feet of gas has to be paid for. If the meter be a four dial one, and the pointer stands between 5 and 6, and the other figures the same as shewn on the three-dial meter, the account would stand thus: 567,500.

Now, we will suppose that at any one quarter your meter stood thus: Between 3 and 4 on the left-hand dial, between 5 and 6 on the middle dial, and between 7 and 8 on the right-hand dial. The way to read it would be 35,700. Then, in the coming June quarter, perhaps the hands would stand as follows: Left-hand dial between 3 and 4, middle dial between 8 and 9, and right hand between 3 and 4. This will shew the figures thus: 38,300. Then, to shew how much gas has been burned during the quarter, you deduct the index figures, 35,700, from the index figures in the June quarter, 38,300; shewing the consumption to have been two thousand six hundred cubic feet, which, say, at five shillings per thousand, would amount to thirteen shillings.

The above gives the consumer no check upon the quality or illuminative power of the gas supplied; and as it is asserted that the heavier the volume of the gas—in other words, the worse the gas—the greater the power exerted on the index, this is worthy of consideration. There are many

questions thus suggested with reference to this now universal product, and not the least are those which, quitting the meter, find their development and inquiry at the nipple or escape of the product when under combustion.

### MEMORIES.

MEMORIES on which we dwell—

Are they those that, well defined  
By their crystal clearness, quell  
Saddest longings of the mind?  
Or which, softly indistinct,  
Full of shadows as in dreams,  
By their mystic beauty link  
Reality to that which seems?

Faces on our way through life,  
Haunting every step we take,  
Some that help us through the strife,  
Some we love for their own sake;  
Are they those on which are stamped  
Energy of thought and will;  
Action that is never cramped,  
Working always, restless still?

Rather those o'er which are thrown  
Gleams of mellow, tender light,  
Wing'd grace of heart and soul,  
Charmed sense of conscious right.  
Artists that we choose apart  
From the few who high are set,  
Just because their lesser art  
Quivers o'er a dead regret;

Are they those who, firm of hand,  
Try the veil of life to raise,  
Though they know the spirit-land  
Never may reward their gaze?  
Rather those who by a touch,  
Or a subtle, silver gleam,  
Shew the sunlit thoughts that rush  
Out of some fantastic dream.

Chords from out some well-worn strain,  
Struck at random when alone,  
Often shadow forth a pain  
Drifting into deeper tone.  
Voices, musical and sweet,  
Sunlit with emotion rife,  
Like the touch of angel-feet,  
Thrill across our inner life.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only. Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

## FACTORY LIFE IN LANCASHIRE.

CONSIDERABLE interest has lately been roused concerning the alleged physical deterioration of young persons employed in factory labour in Lancashire. To guard against such possible consequences, certain acts of parliament were passed, enforcing rules as to hours of labour, the age at which children could be employed, and so on; and there was a belief that regulations of this nature had stemmed a serious growing evil. Some examinations lately made by the Royal Commissioners appointed to inquire into the operation of the Factory and Workshops Acts, serve to shew that in Lancashire the supposedly excellent regulations fall greatly short of their intentions. The truth seems to be, that in this, as in a few other matters, acts of parliament are hopelessly inadequate to reach an acknowledged evil, which is not only physical but moral. The law can punish offences, but it does not effectually check greed or any of the baser passions. In short, it does not prevent expenditure on those wretched indulgences which tend to deteriorate the physical and moral qualities of the population. It may, indeed, be said, that a reliance on acts of parliament for the removal of moral evils has, by relaxing individual effort, first and last done incalculable mischief.

Among those who were examined at Manchester by the Royal Commissioners was Dr Ferguson, of Bolton, for fourteen years a certifying surgeon under the Factory Act. It was his duty to certify as to the age of children presented for employment, and it appears from his evidence that one-half of the children offered were physically unable to work full time, and that proofs of this were increasing from year to year. Here is a sorrowful fact. The statement that the bone and sinew of wealth-producing Lancashire are degenerating year by year is a startling one, not only for philanthropists, but for all who have the welfare of the working-classes at heart, to say nothing of the economists, who for years have looked upon Lancashire as 'the workshop of the world.'

Bolton—the town in which Dr Ferguson prac-

tises—seems unfortunate in the matter of health. It is now nearly four years since Dr Ballard, of London, was appointed by government to inquire into the high rate of mortality then existing in the town, especially amongst infants. He visited Bolton and the district, and some months afterwards gave in his Report. At that time, he states in one paragraph: 'Mr Ferguson, one of the oldest medical practitioners in the town, and a certifying surgeon under the Factory Acts, informed me that he has observed a steady physical degeneration proceeding, which he attributes in part to the intemperate habits of the parents, and in part to the bad feeding of the children up to the time that they are old enough to work in the factories.' Dr Ballard attributed the high rate of mortality in the town to deficient sanitary arrangements, the condition of the dwellings, the ignorance of mothers, the neglect of infants, and improper diet. Under the latter heads he stated: 'The other cause to which the high death-rate amongst infants must be referred, is the practice amongst the operatives who become mothers of returning to their work at the factory as soon as possible after their confinement. On inquiry amongst the women themselves, and of the surgeons practising in Bolton, I learn that in some cases the women have been known to return as early as a fortnight after their infant has been born; and very commonly they return to their labour within the month. If the woman should chance to have a relative or female friend at home, or a girl sufficiently old to carry a baby, with whom she can leave it, this is the plan usually adopted. But if not, when she leaves for the mill at half-past five o'clock in the morning, she takes the baby out of a warm bed, and carries it to some person—generally an elderly female—with whom she leaves it for the day. In preference, she will carry it to some one residing near the factory at which she works, and this may be half a mile or a mile from her house. The season of the year makes no difference. If the distance is not great, the mother will return at breakfast or dinner time, or both, to suckle her infant, otherwise she will not see it again until

she leaves work in the evening. In the meantime the infant must be fed. Very young babies are fed usually with milk (such as it is) out of a bottle. Some of those bottles which I saw in use were uncleansed, sour, and incrustated with curdled milk; and the medical men informed me that this quite coincides with their own repeated observations. In other cases, the youngest infants are fed, as those a few months old are, with bread sopped in warm water, in a cup which is left for hours upon the hob to keep warm and become sour. When about to be used, the bread is broken down with a spoon, and a little milk is added. I saw one cup of sopped bread thus prepared for use. It was said to have been boiled, but it contained tough pieces which boiling had not even softened. A halfpenny-worth or a penny-worth of milk (quarter of a pint to a pint according to quality) per diem is considered a liberal allowance. The mothers pay, I understand, from half-a-crown to three shillings and sixpence per week to the persons who take charge of their babies—this to include food. Those persons having their own household business to attend to, and, moreover, a certain and considerable amount of neighbourly visiting and gossiping to perform, commonly depute some little girl to hold the baby in their absence; and such children may be seen any day and any hour, and almost anywhere in the town, sitting on a doorstep, exposing the infant to the cooling influence of the draught between the door and the fire. It is no matter of surprise that this system of management results in all the evils of mal-nutrition, in attacks of diarrhoea in the summer, and of pulmonary inflammation in the winter, and very often in the death of the infants. One of the district registrars informed me that he had often occasion to reprove the mothers coming to him for the necessary certificate to present to the burial clubs in which their infants had been entered, on account of the jaunty way in which they made the application. In the course of my experience as a Medical Officer of Health, I have seen a great deal of the families of the poor in London, but I can safely say that, during the few days I was engaged in visiting the habitations of the operatives in Bolton, I saw a larger number of miserable emaciated infants undergoing the process of gradual starvation upon the system then in vogue than I had ever seen before in as many months. Here the doctor gives cases in support of his observations, all of a more or less harrowing nature.

This extract, amongst many more from Dr Ballard's Report, revealed a state of affairs existing in the town at the period of his visit which was most alarming, and called for immediate action. Energetic measures were at once taken. A Medical Officer of Health—one in reality, and not the mere nominal official who previously existed—was appointed, nuisances were removed, back-to-back houses and cellar-dwellings condemned, and destroyed or closed, drainage supplied, and many other improvements effected, which Dr Ballard recommended should be accomplished. But this promptitude could not nullify the bad effects of all the previous evil which had existed; and the Report of Dr Ballard confirms Dr Ferguson in his statements before the Commission as to the sickly condition of the children in many of the cotton factories of Lancashire. Children thus nursed, or rather 'dragged up,' to use a local phrase,

and having had the good or ill fortune to escape a premature grave, could not but be puny, stunted, rickety offspring; and yet when these unfortunate weaklings—the appearance of many of whom reminds one of the inmates of Dotheboys Hall—reach the age of thirteen, they are compelled to work from six o'clock in the morning until half-past five o'clock in the evening, precisely the same as a full-grown man.

And now we come to the causes which, according to Dr Ferguson, have originated such pitiable results. In addition to the infantile neglect referred to by Dr Ballard, Dr Ferguson ascribes the condition of the children to the fact, first, of the intemperate habits of the factory workers—the parents of the children. By free indulgence in stimulants, and in many cases by excess in smoking, they debilitated their own constitutions, and in that way transmitted feeble constitutions to their children. The next cause of this state of things he considered to be, that during the last thirty years the people had adopted a mode of rearing their children which he looked upon as exceedingly vicious. Instead of bringing them up on milk, they habitually fed them on tea or coffee night and morning, and in many instances on tea three times a day, and gave them very little milk. He found, from the information he had obtained, that while children between thirteen and sixteen years of age who had been brought up on tea or coffee increased in weight only about four pounds a year, those fed on milk increased at the rate of about fifteen pounds a year. Another cause of the degeneracy of the male population was, that youths between the ages of twelve and twenty smoked or chewed tobacco; and however well an adult might be able to bear moderate smoking, there was no doubt that it operated most prejudicially on the health and development of a growing child. In conclusion, he expressed his conviction, that during the last fourteen years children had decidedly deteriorated physically, not in consequence of any restriction in the hours of labour under the Factory Acts, but in consequence of the operation of the causes he had mentioned. His opinion was, that the standard of age should be kept at thirteen years, and that the child should be of the ordinary appearance and strength of thirteen. If that rule were enforced, and universally known among parents, he believed it would compel them, in their own interest, to use a different mode of bringing up their children.

The cause of perhaps the chief of these evils is, no doubt, the great cost of pure and good milk compared with that of tea. The article so called cannot be bought in Bolton under threepence a quart; while scores of shops in the town offer tea at two shillings per pound, many of them offering at the same time showy goods, such as glass candlesticks, chimney ornaments, common German prints, and other articles, as premiums to be presented to the purchasers of so many pounds of the worthless rubbish they accompany. As for the intemperance of the parents, the appearance of the streets of Bolton as well as other Lancashire towns on Saturday nights is quite sufficient to convince the most sceptical of the fact, that a great deal of money is needlessly spent in public-houses by the working portion of our towns. The doors of spirit-vaults are kept constantly on the swing until 'closing time,' and every tap-room is filled. And yet

such is the force of habit in the effect upon the constitutions of some of the tipplers, that some of the factory operatives have been heard to boast that they had imbibed eight or ten pints of liquor between three o'clock in the afternoon and eleven in the evening, without going home 'fuddled.' Others never resume work until the Tuesday following, the intervening time being spent in drinking; while some there are who are in a constant state of intoxication for weeks together. Such being the case, no wonder that so many children are born into the world inheriting the 'sins of the fathers' in debilitated constitutions and impaired intellects. The habit of smoking is also, no doubt, indulged in to a great extent by the growing youth of our factory population, and, carried as it is to excess, cannot be too strongly deprecated.

The remedy for many of the evils which have been pointed out by Dr Ferguson cannot, we think, be supplied by legislative enactment. It is for the social reformer to devise means to counteract the influences which are at work, and endeavour to stop the decadence among the factory population which it is stated has commenced. Educational agencies, now happily in full exercise, may do something; so may the diffusion of a taste for reading and rational recreation; and so likewise will be the exhortations of those who, in their lives, can offer an example worthy of being followed. It is at all events important to know that acts of parliament are not exactly the thing to be relied on.

## THE FLAG OF DISTRESS.

### CHAPTER IX.—A SHIP WITHOUT SAILORS.

AMONG the vessels lying in the harbour of San Francisco is one, athwart whose stern may be read the name *El Condor*.

She is a ship of small size—some five or six hundred tons—devoted to peaceful commerce, as can be told by certain peculiarities of rig and structure understood by seamen.

The name will suggest a South American nationality—Ecuadorian, Peruvian, Bolivian, or Chilean—since the bird after which she has been baptised is found in all these states. Columbia and the Argentine Confederation can also claim it.

But there is no need to guess at the particular country to which the craft in question belongs. The flag suspended over her tailfin declares it by a symbolism intelligible to those who take an interest in national insignia.

It is a tricolour—the orthodox and almost universal red, white, and blue—not, as with the French, disposed vertically, but in two horizontal bands, the lower one crimson red, the upper half-white, half-blue, the last contiguous to the staff, with a single five-pointed star set centrally in its field: this, with the disposition of colours, proclaiming the ship that carries them to be of Chili.

She is not the only Chilean vessel in the harbour of San Francisco. Several other craft are there, that shew the same colours; brigs, barques, schooners, and ships. For the spirited little South American republic is prosperous as enterprising, and its flag waves far and wide over the Pacific. With its population of skilled miners, it has been among the first of foreign states in sending a large representative force to cradle the

gold of California. Not only are its ships lying in the bay, but its *guasos* and *gambusinos* in goodly number tread the streets of the town; while many of the dark-eyed damsels, who from piazzas and balconies salute the passer-by with seductive smiles, are those charming little Chileñas that make havoc with the heart of almost every Jack-tar who visits Valparaiso.

On the ship *El Condor* we meet not much that can be strictly called Chilean; little besides the vessel herself, and the captain commanding her. Not commanding her sailors; since there are none aboard, hailing from Chili or elsewhere. Those who brought her into San Francisco Bay have abandoned her—gone off to the gold-diggings! Arriving in the heat of the placer-fever, they have preferred seeking fortune with pick, shovel, and pan, to handling tarry ropes at ten dollars a month. Almost on the instant of the *Condor's* dropping anchor, they deserted to a man, leaving her skipper alone, with only the cook for a companion. Neither is the latter Chilean, but African—a native of Zanzibar. Neither are the two great monkeys observed gambolling about the deck; for the climate of Chili, lying outside the equatorial belt, is too cold for the *quadrumanus*.

Not much appearing upon the *Condor* would proclaim her a South American ship. And nothing in her cargo, though a cargo she carries. She has just arrived from a trading voyage to the South Sea Isles, extending to the Indian Archipelago; whence her lading, a varied assortment, consisting of tortoise-shell, spices, mother-of-pearl, Manila cigars, and such other commodities as may be collected among the oriental islands. Hence also two large *myas* monkeys—better known as orang-outangs—seen playing about her deck. These she has brought from Borneo.

Only a small portion of her freight had been consigned to San Francisco; and this has been long ago landed. The rest remains in her hold, awaiting transport to Valparaiso. How soon she may arrive there, or take departure from her present anchorage, is a question that even her captain cannot answer. If asked, he would most probably reply, '*Quien sabe?*' and further pressed, might point to her deserted decks, offering that as an explanation of his inability to satisfy the inquirer. Her captain—Antonio Lantanas by name—is a sailor of the Spanish-American type; and being this, he takes crosses and disappointments coolly. Even the desertion of his crew seems scarcely to ruffle him; he bears it with a patient resignation that would be quite incomprehensible to either English or Yankee skipper. With a broad-brimmed *jipi-japa* hat shading his thin swarth features from the sun, he lounges all day long upon his quarter-deck, with elbows usually rested upon the capstan-head; his sole occupation being to roll paper cigarritos, one of which is usually either in his fingers or between his lips. If he at any time varies this, it is to eat his meals, or take a turn at play with his pet monkeys. These are male and female, both full of fun in their uncouth fashion; and Captain Lantanas takes it out of them by occasionally touching their snouts with the lit end of his cigarette; laughing to see them scamper off, scared at the singular, and somewhat painful, effect of fire.

His meals are served regularly three times a day; and his cook—a negro, black as the tar upon

the ratline ropes—after having served them, returns to an idleness equalling his own. He, too, has his diversion with the oranges, approaching much nearer to them in physical appearance, and for this reason, perhaps, to them a more congenial playmate.

Once a day, the skipper steps into his gig, and rows himself ashore. But not to search for sailors; he knows that would be an idle errand. True, there are plenty of them in San Francisco; scores parading its streets, and other scores seated or standing within its taverns and restaurants. But they are all on the spree—all rollicking, and if not rich, hoping soon to be. Not a man of them could be coaxed to take service on board an out-bound ship, for a wage less than would make the voyage unprofitable to her owners.

As the Chilean skipper is not only master, but proprietor of his own craft, he has no intention to stir under the circumstances; but is contented to wait till times change, and tars become inclined again to go to sea. When this may be, and the *Condor* shall have spread her canvas wings for a further flight to Valparaiso, he has not the remotest idea. He enters the town but to meet other skippers with ships crewless as his own, and exchange condolences on their common destitution. On a certain day—that on which we are introduced to him—he has not sculled himself ashore; but abides upon his vessel, awaiting the arrival of one who has sent him a message.

Although San Francisco is fast becoming transformed into an American city, and already has its several newspapers, there is among them a small sheet printed in Spanish, by name *El Diario*. In this, Captain Lantanas has advertised his vessel, open for freight or passage, bound for Valparaiso, and to call at intermediate ports—Panama among the number. The advertisement directs reference to be made to a shipping-agent, by name Don Tomas Silvestre. In answer to it, Captain Lantanas has received a letter from a gentleman who has already communicated with his agent, and who has promised to present himself on board the *Condor* by twelve meridian of this day.

Although a stranger to the port of San Francisco, the Chilean skipper has some knowledge of his correspondent; for Don Tomas has the day before informed him that a gentleman from whom he may expect to hear—the same whose name is signed to the letter—is a man of wealth; a large landed proprietor, whose acres lie contiguous to the rising city of San Francisco, and for this reason enormously increased in value by the influx of gold-seeking immigrants. What this important personage may want with him, Lantanas cannot tell; for Silvestre himself has not been made aware of it—the gentleman declining to state his business to any other than the captain of the ship.

On the morning of the appointed day, leaning as usual against his capstan, and puffing his paper cigar, the Chilean skipper is not in a mood for playing with his monkey pets; his mind is given to a more serious matter, his whole thoughts being absorbed in conjecturing for what purpose his unknown correspondent may be seeking the interview. He is not without surmises, in which he is assisted by something he has heard while mixing in Spanish circles ashore—this, that the landowner in question has lately sold his land, realising an immense sum—half a million dollars

being rumoured. Furthermore, that, being a Spaniard, and neither Mexican nor Californian, he is about to return to Spain, taking with him his household gods—Lares, Penates, and all. These could not be stowed in a single state-room, but would require a whole ship, or a goodly portion of one. The *Condor* has still plenty of room to spare. Her hold is not half full; and her cabin has accommodation for several passengers. It may be on this very business his correspondent is coming aboard? Captain Lantanas so interrogates himself, while standing upon his quarter-deck, and with the glowing coal of his cigarrito fending off his hairy familiars, who, in their play, at times intrude upon him. It pleases him to think he may have surmised correctly; and while still indulging in conjecture, he sees something which puts an end to it. This is a shore-boat, with a single pair of rowers, and a gentleman—evidently a landsman—seated in the stern-sheets, to all appearance coming on for the *Condor*. Captain Lantanas steps to the side of his ship, and, standing in her waist, awaits the arrival of his visitor. As the boat draws near he makes out a man, dressed in semi-Californian costume, such as is worn by the higher class of *hacendados*. The skipper can have no question as to who it is. If he has, it is soon answered; for the boat touching the ship's side is instantly made fast; the Californian mounts the man-ropes; and, stepping down upon the deck, hands Captain Lantanas his card.

He who has presented himself on the quarter-deck of the *Condor* is a man in years well up to sixty, and somewhat above medium height. Taller than he appears, through a slight stoop in the shoulders. His step, though not tottering, shews vigour impaired; and upon his countenance are the traces of recent illness, with strength not yet restored. His complexion is clear, rather rubicund, and in health might be more so; while his hair, both on head and chin—the latter a long flowing beard—is snow-white. It could never have been very dark, but more likely of the colour called sandy. This, with grayish-blue eyes, and features shewing some points of Celtic conformation, would argue him either no Spaniard, or if so, one belonging to the province of Biscay.

This last he is; for the correspondent of Captain Lantanas is Don Gregorio Montijo.

#### CHAPTER X.—A CHARTER-PARTY.

Soon, as assured—by a glance at the card given him—that his visitor is the gentleman who has written to appoint an interview, Captain Lantanas politely salutes; and, jipi-japa in hand, stands waiting to hear what the *hacendado* may have to say.

The latter, panting after the effort made in ascending the man-ropes, takes a moment's time to recover breath; then, returning the skipper's bow, he interrogates: 'Captain Lantanas, I presume?'

'Si, señor,' responds the master of the *Condor*, with a bow of becoming humility to a man reputed so rich. Then adding: '*A disposicion de V.* [At your service].'

'Well, captain,' rejoins Don Gregorio, 'I shall take it for granted that you know who I am. Don Tomas Silvestre has informed you, has he not?'

'He has, señor.'

'And you've received my letter?'

'Si, señor.'

'That's all right, then. And now to proceed to the business that has brought me aboard your ship. Having seen your advertisement in the *Diario*, I communicated with Don Tomas, but only so far as to get your correct address, with some trifling particulars. For the rest, I've thought it best to deal directly with yourself; as the matter I have in hand is too important to be altogether intrusted to an agent. In short, it requires confidence, if not secrecy; and from what I've heard of you, captain, I feel sure I can confide in you.'

'You compliment me, Señor Montijo.'

'No, no; nothing of the kind. I but speak from the impression Silvestre has given me of your character. But now to business. Your ship is advertised for freight, or passage?'

'Either, or both.'

'Bound for Valparaiso and intermediate ports?'

'Anywhere down the coast.'

'Have you any passengers already engaged?'

'Not any as yet.'

'How many can you take?'

'Well, señor, to speak truth, my craft is not intended to carry passengers. She's a trading-vessel, as you see. But if you'll step down to the cabin, you can judge for yourself. There's the saloon—not very large, it is true—and sleeping accommodation for six—two snug state-rooms, that will serve, if need be, for ladies.'

'That will do. Now about the freight. Don Tomas tells me you have some cargo aboard.'

'A portion of my ship is already occupied.'

'That won't signify to me. I suppose there's enough room left for something that weighs less than a ton, and isn't of any great bulk. Say it will take half a score of cubic feet. You can find stowage for that?'

'O yes; much more than that.'

'So far good. And you can accommodate three passengers: a gentleman and two ladies? In short, myself and the female members of my family—my daughter and grand-daughter?'

'Will the Señor Montijo step into the *Condor's* cabin, and see for himself?'

'By all means.'

Captain Lantanas leads down the stair-way, his visitor following. The saloon is inspected; after it the sleeping-rooms, right and left.

'Just the thing,' says Don Gregorio, speaking in soliloquy, and evidently satisfied. 'It will do admirably,' he adds, addressing himself to the skipper. 'And now, Captain Lantanas, about terms. What are they to be?'

'That, señor, will depend on what is wanted. To what port do you wish me to take you?'

'Panama. 'Tis one of the ports mentioned in your advertisement?'

'It is, señor.'

'Well, for this freight—as I've told you, about a ton, with some trifling household effects—and the three passengers, how much?'

'The terms of freight, as you may be aware, are usually rated according to the class of goods. Is it gold, Don Gregorio? From your description, I suppose it is.'

The skipper has guessed aright. It is gold—nearly a ton of it—accruing to Don Gregorio from the sale of his land, for which he has been paid in dust and nuggets, at that time the only coin in California—indeed, the only circulating medium,

since notes were not to be had. The ex-haciendado is by no means a niggardly man; still, he would like to have his treasure transported at a rate not exorbitant. And yet he is anxious about its safety; and for this reason has resolved to ship it with secrecy, and in a private trading-vessel, instead of by one of the regular liners, already commenced plying between San Francisco and Panama. He has heard that these are crowded with miners returning home; rough fellows, many of them queer characters, some little better than bandits. He dislikes the idea of trusting his gold among them, and equally his girls, since no other ladies are likely to be going that way. He has full faith in the integrity of Captain Lantanas, and knows the Chilean skipper to be a man of gentle heart—in fact, a gentleman. Don Tomas has told him all this.

Under the circumstances, and with such a man, it will not do to drive too hard a bargain; and Don Gregorio, thus reflecting, confesses his freight to be gold, and asks the skipper to name his terms.

Lantanas, after a moment spent in mental calculation, says: 'One thousand dollars for the freight, and a hundred each for the three passages. Will that suit you, señor?'

'It seems a large sum,' rejoins the ex-haciendado. 'But I am aware prices are high just now, so I agree to it. When will you be ready to sail?'

'I am ready now, señor—that is, if—'

'If what?'

The captain, remembering his crewless ship, does not make immediate answer.

'If,' says Don Gregorio, noticing his hesitation, and mistaking the reason—'if you're calculating on any delay from me, you needn't. I can have everything on board in three or four days—a week at the utmost.'

The skipper is still silent, thinking of excuses. He dislikes losing the chance of such a profitable cargo, and yet knows he cannot name any certain time of sailing, for the want of hands to work his ship. There seems no help for it but to confess his shortcomings. Perhaps Don Gregorio will wait till the *Condor* can get a crew. The more likely, since almost every other vessel in port is in a similar predicament.

'Señor,' he says at length, 'my ship is at your service, and I should be pleased and proud to have you and your ladies as my passengers. But there's a little difficulty to be got over, before I can leave San Francisco.'

'Clearance duties—port dues to be paid. You want the passage-money advanced, I presume? Well, I shall not object to prepaying it in part. How much will you require?'

'*Mil gracias*, Señor Montijo. It's not anything of that kind. Although far from rich, thank Heaven, neither I nor my craft is under embargo. I could sail out of this harbour in half an hour, but for the want of—'

'Want of what?' asks the ex-haciendado, in some surprise.

'Well, señor—sailors.'

'What! Have you no sailors?'

'I am sorry to say, not one.'

'Well, Captain Lantanas, I thought it strange that I observed nobody aboard your ship—except that black fellow. But I supposed your sailors had gone ashore.'

'So have they, señor; and intend staying there. Alas! that's the trouble. They've gone off to the gold-diggings—every one of them, except my negro cook. Likely enough, I should have lost him too, but he knows that California is now part of the United States, and fears that some speculating Yankee might make a slave of him, or that he might meet his old master: for he has had one already.'

'How vexatious all this!' says Don Gregorio. 'I fear I shall have to look out for another ship.'

'I fear you'll not find one much better provided than mine—as regards sailors. In that respect, to use a professional phrase, we're all in the same boat.'

'You assure me of that?'

'I do, señor.'

'I can trust you, Captain Lantanas. As I have told you, I'm not here without knowing something of yourself. You have a friend in Don Tomas Silvestre?'

'I believe I have the honour of Don Tomas' friendship.'

'Well, he has recommended you in such terms that I can thoroughly rely upon you; for that reason, I shall now make known why I wish to travel by your ship.'

The Chilean skipper bows thanks for the compliment, and silently awaits the proffered confidence.

'I have just sold my property here, receiving for it three hundred thousand dollars in gold-dust—the same intended for your freight. It is now lying at my house, some three miles from town. As you must be aware, Captain Lantanas, this place is at present the rendezvous of scoundrels collected from every country on the face of the earth, but chiefly from the United States and Australia. They live and act almost without regard to law; such judges as they have being almost as great criminals as those brought before them. I feel impatient to get away from the place; which, under the circumstances, you won't wonder at. And I am naturally anxious about my gold-dust. At any hour a band of these lawless ruffians may take it into their heads to strip me of it—or, at all events, attempt to do so. Therefore, I wish to get it aboard a ship—one where it will be safe, and in whose captain I can thoroughly confide. Now, captain, you understand me?'

'I do,' is the simple response of the Chilean. He is about to add that Don Gregorio's gold, as also his secret, will be safe enough, so far as he can protect it, when the ex-haciendado interrupts him by continuing:

'I may add that it is my intention to return to Spain, of which I am a native—to Cadiz, where I possess some property. That, I intended doing anyhow. But now, I want to take my departure at once. As a Spaniard, señor, I needn't point out to you, who are of the same race, that the society of California cannot be congenial—now that the rowdies of the United States have become its rulers. I am most anxious to get away from the place as soon as possible. It is exceedingly awkward your not having a crew. Can't something be done to procure one?'

'The only thing is to offer extra pay. There are plenty of sailors in San Francisco; for they've not all gone to gather gold. Some are engaged in scattering it. Unfortunately, most are worth-

less drunken fellows. Still it is possible that a few good men might be found, were the wages made sufficiently tempting. No doubt, an advertisement in the *Diario*, offering double pay, might procure me as many hands as should be needed for working my ship.'

'How much would it all amount to?'

'Possibly an extra thousand dollars.'

'Suppose I pay that; will you engage the whole ship to me; that is, take no other passengers, or wait for any more freight, but sail at once—soon as you've secured a crew? Do you agree to such terms?'

'Si, señor; they are perfectly satisfactory.'

'In that case, I'll be answerable for the extra wages. Anything to get away from this pandemonium of a place.'

'I think we shall have no great difficulty in getting sailors. You authorise me to advertise for them?'

'I do,' answers Don Gregorio.

'Enough!' rejoins the skipper. 'And now, señor, you may make your preparations for embarking.'

'I have not many to make. Nearly all has been done already. It's only to get our personal baggage aboard, with the freight safely stowed. By the way,' adds the ex-haciendado, speaking *sotto-voce*: 'I wish to ship the gold as soon as possible, and without attracting any attention to it. You understand me, captain?'

'I do.'

'I shall have it brought aboard at night, in a boat which belongs to Silvestre. It will be safer in your cabin than anywhere else—since no one need be the wiser about the place of deposit.'

'No one shall, through me.'

'That I feel certain of, Señor Lantanas. Don Tomas is your endorser; and would be willing to be your bondsman, were it needed—which it is not.'

Again the *Condor's* captain bows in acknowledgment of the confidence reposed in him; and after some further exchange of speech, respecting the shipment of the treasure, and the writing out an advertisement which Don Gregorio is to get inserted in the *Diario*, the latter returns to his boat, and is rowed back to the shore; while the Chilean skipper lights a fresh cigarrito, and with elbows rested on the capstan-head, resumes the attitude of *insouciance*, out of which he has been temporarily aroused.

#### CHAPTER XI.—IN SEARCH OF A SECOND.

Just about the time Don Gregorio is taking leave of Captain Lantanas, the two unreceived visitors are turning their backs upon his house. De Lara feels the discomfiture the keenest. His heart is harrowed with mingled emotions—passions of varied complexion, all evil. His lips are livid with rage, his brow black with chagrin; while his eyes fairly scintillate with unsatisfied vengeance. While returning along the avenue he neither looks back, nor up. Not a syllable escapes him. With glance upon the ground, he rides in sullen silence.

After clearing the entrance-gate, and again upon the outside road, he turns face toward the dwelling whose hospitality has been denied him. He sees nought there to soothe, but something which still further afflicts him. Four horses are filing out through the front-gate, conducted by

grooms. They are saddled, bridled, ready for being mounted. To his practised eye, their caparison tells that they are intended only for a short excursion, not a journey. And though their saddles are nearly alike, he knows that only two of them are to be mounted by men, the other two to carry ladies. The señoritas are going out for a ride—a *paseo de campo*—accompanied by their English guests. Simultaneously, as instinctively, the two Californians arrive at this conclusion. Now they know why they were not received; a knowledge which, instead of tranquillising their chafed spirits, but maddens them the more. The thought of their sweethearts being escorted by their rivals, riding along wild unfrequented paths, through trees overshadowing, away from the presence of spying domestics, or the interference of protecting relatives, beyond the eyes and ears of every one—the thought that Carmen Montijo and Inez Alvarez are setting out on an excursion of this kind, is to Frank Lara and Faustino Calderon bitter as deadliest poison. And reflection embitters it the more. The excursionists will have every opportunity of wandering at will. They will become separated; and there can be no doubt as to how the partition will be made: the older of the two officers will pair off with Doña Carmen, the younger with Doña Inez. Thus, they will ride unmolested, unobserved; converse without fear of being overheard, clasp hands without danger of being seen—perhaps exchange kisses. O the dire, maddening jealousy! Even the dull brain and cold heart of Calderon are fired by these reflections. They sting him to the quick. But not as De Lara, for not as De Lara does he love.

After gazing for a while at the house—at the horses and grooms—at the preparations that are being made for mounting—noting their magnificent style—with a last glance such as Satan gave when expelled from Paradise, the Creole drives the spur deep into his horse's side, and dashes off down the hill, Calderon keeping after. At its bottom they again halt, being now out of sight of the house. Facing toward his companion, De Lara says: 'We're in for a fight, Faustino; both of us.'

'Not both. I don't think I'm called upon to challenge that youngster. He's but a boy.'

'He's been man enough to insult you; and, if I mistake not, you'll find him man enough to meet you.'

'I don't see that he *did* insult me.'

'Indeed; you don't! Sticking your horse, as if it were a pig, and sending him off in a stampede that well-nigh dismounted you; all before the face of your lady-love—right under her eyes! You don't deem that an insult, eh?'

'But you must remember, I gave him provocation. At your instigation, I nearly rode over him. Looking at it in that light, he's in a sense excusable for what he did. Besides, he only meant it as a joke: when it was all over, he laughed at it.'

'Not at it, but at you. So did your sweetheart, *amigo*. As we reined up under the walls, I could see her long lashes drooping down, her eyes looking disdain at you, with her pretty lips pouting in scorn. You're evidently out of her good graces, and you'll have to do something ere you can reinstate yourself.'

'Do you really think so?'

'I'm sure of it. Never surer of anything in my life.'

'But what would you have me do?'

'You ought to know without asking me. Call out the cub, and kill him—if you can. That's what I design doing with my gentleman.'

'Ah! you're a dead shot; and that makes all the difference. These Anglo-Saxons always use pistols; and if I challenge him, he'll have the choice of weapons.'

'Quite true. With me it will be different. I took care to give the affront, and you should have done the same. Seeing you got the worst of it, you ought to have followed up your first dash at him by something besides—a slap across the cheek, or a cut with your whip.'

'I'm sorry now, I didn't do one or the other.'

'Well, you may find an opportunity yet. For my quarrel, I don't care a toss whether it be settled with swords or pistols. We Creoles of Louisiana are accustomed to the use of either weapon. Thanks to old Gardalet of the Rue Royale, I've got the trick of both; and am equally ready to send a half-ounce of lead, or twelve inches of steel, through the body of this Britisher. By the way, what's his name?'

The speaker pulls out the card given him by the English officer, and glancing at it, answers his own question: 'Edward Crozier, H.M.S. *Crusader*. Ha! Mr Ned Crozier!' he exclaims, speaking in plain English, the sight of the card seemingly giving a fresh fillip to his spleen; 'you've had your triumph to-day. It will be mine to-morrow; and, if my old fortune don't fail me, there'll be an empty seat at the mess-table of the ship *Crusader*.'

'You really intend fighting him?'

'Now, Don Faustino Calderon, why do you ask that question?'

'Because, I think, all might be arranged without—'

'Without what? Speak out, man!'

'Why, without any spilling of blood.'

'You may arrange that way, if you like. Your quarrel is a distinct one, and I've nothing to do with it, having my own hands full. Indeed, if they were empty, I'm not so sure I should second your talking as you do. However, that's not the purpose now. In answer to your first question, I can only say what I've said before. I not only intend fighting this Crozier, but killing him. I may fail in this my intention—if so, there's an end of it, and of *me*. For once on the ground, I don't leave it a living man if he do. One or both of us shall stay there till we're carried off—dead.'

'*Carramba!* your talk gives me the trembles. It's not pleasant to think of such a thing, let alone doing it.'

'Think your own way, and welcome. To me it would be less pleasant to leave it undone, now, than ever in my life. After what I've gone through, I don't care much for character—in truth, not a straw. That's all stuff and pretension. Money makes the man, and without it he's nothing; though he were a saint. Respectability—bah! I don't value it a *claco*. But there's a reputation of another kind I do value, and intend to preserve. Because in my world it counts for something—has counted already.'

'What is that?'

'Courage. Losing it, I should lose everything. And in this very city of San Francisco, I'd be only

a hound where I'm now a hunter; barked at by every cur, and kicked by every coward who chose to pick a quarrel with me.'

'There's no danger of that, De Lara. All who have had dealings with you, know better. There's little fear of any one putting a slight upon you.'

'There would be if I refused to fight this fellow. Then you'd see the difference. Why, Faustino Calderon, I couldn't sit at a *monté* table, and keep the red-shirts from robbing us, if they didn't know 'twould be a dangerous game to play. However, it isn't their respect I value now, but that of one very different.'

'Who?'

'Again you ask an idle question; so idle, that I don't believe you care a straw for Láz Alvarez—or know what love is.'

'What has she to do with it?'

'She—nothing. That's true enough. I don't care aught for her, or what she might think of me. But I do for Carmen Montijo, and her good opinion. At least, so far that she shan't think me either fool or coward. She may be fancying me the first; but if she do, she'll find herself mistaken. At all events, she'll get convinced that I'm not the last. And if it be as rumour reports, and as you say you've heard, that she's given her heart to this *gringo*, I'll take care she don't bestow her hand upon him—not while I live. When I'm dead, she can do as she likes.'

'But after what's passed, do you intend returning to propose to her?'

'I do. Though not till we've finished this affair with the fellows who've interrupted us. Yes; I'll give her every chance to save herself. She shall say yea, or nay, in straight speech, and in so many words. After that, I'll understand how to act. But come! we're wasting time. A duel's a thing won't do to dally over. Do you intend to meet your man, or not?'

'I'd rather not,' replies the poltroon, hesitatingly; 'that is, if the thing can be arranged. Do you think it can, De Lara?'

'Of course, it can; your thing, as you call it; though not without disgrace to you. You should fight him, Faustino.'

'Well; if you say I should, why, I suppose I must. I never fired a pistol in my life, and am only second-rate with the sword. I can handle a *machete*, or a *cuchilla*, when occasion calls for it; but these weapons won't be admitted in a duel between gentlemen. I suppose the sailor fellow claims to be one?'

'Undoubtedly he does, and with good reason. An officer belonging to a British man-of-war would call you out for questioning such a claim. But I think you under-rate your skill with the small-sword. I've seen you doing very well with it at Roberto's fencing-school.'

'Yes; I took lessons there; but fencing is very different from fighting.'

'Never mind. When you get on the duelling-ground, fancy yourself within the walls of Roberto's shooting-gallery, and that you are about to take a fresh lesson in the *art d'escrime*. Above all, choose the sword for your weapon.'

'How can I, if I'm to be the challenger?'

'You needn't be. There's a way to get over that. The English officers are not going straight back to their ship; not likely before a late hour of the night. After returning from this ride, I

take it they'll stay to dinner at Don Gregorio's, and with wine to give them a start, they'll be pretty sure to have a cruise, as they call it, through the town. There, you may meet your man, and can insult him by giving him a cuff, spitting in his face, anything to put the onus of challenging upon him.'

'*Por Dios!* I'll do as you say.'

'That's right. Now, let us think of what's before us. As we're both to be principals, we can't stand seconds to one another. I know who'll act for me. Have you got a friend you can call upon?'

'Don Manuel Diaz. He's the only one I can think of.'

'Don Manuel will do. He's a cool hand, and knows all the regulations of the *duello*. But he's not at home to-day. As I chance to know, he's gone to a *funcion de gallos* at Punta Pedro; and by this time should be in the cockpit.'

'Why can't we go there? Or had we better send?'

'Better send, I think. Time's precious—at least mine is. As you know, I must be at the *monté*-table soon as the lamps are lit. If I'm not, the bank will go begging, and we may lose our customers. Besides, there's my own second to look up, which must be done this day before I lay a hand upon the cards. What hour is it? I've not brought my time-piece with me.'

'Twelve o'clock, and a quarter past,' answers Calderon, after consulting his watch.

'Only that! Then we'll have plenty of time to get to the cock-fight, and witness a main. Don Manuel has a big bet on his *pardo*. I'd like to stake a doubloon or two myself on that bird. Yes, on reflection, we'd better go ourselves. That will be the surest way to secure the services of Diaz. *Vamonos!*'

At this the two intending duellists again set their steeds in motion; and, riding for a short distance along the shore-road, turn into another, which will take them to Punta Pedro. Their jealous anger still unappeased, they urge their horses into a gallop, riding as if for life, on an errand whose upshot may be death—to one, or both of them.

#### SEVENTEEN YEARS AMONG SAVAGES.

A REMARKABLE case of the naturalisation of a French sailor-boy among savages during the period of seventeen years, has just been brought to light by Australian correspondents of *The Times*, in which paper for July 21 an account of the case is amply detailed. From it we offer the following condensed statement.

In 1858, the ship *St Paul* of Bordeaux sailed from China for Australia, having on board three hundred and fifty Chinese coolies. The vessel was not so fortunate as to reach its destination. It was wrecked, one dark night, on a reef of Roussel Island, in the Louisiade Archipelago, east of New Guinea. The captain and sailors got off in three boats, and made for the main island, leaving the Chinese and a sailor-boy, named Narcisse Peltier or Pelletier, to their fate; so deserted, they walked along the reef to a small island connected with it. The captain's party being attacked by natives,

retreated to the small island where the Chinese had found a temporary refuge. Again, the captain and sailors made off in their boats. Besides leaving the Chinese, they intended to desert the boy Narcisse; but he discovered their intentions, and, following them to the boat, was taken on board. How long their voyage lasted, is uncertain. They subsisted on a paste of flour and water, and such sea-birds as they could catch, which were devoured raw. Two or three days before they reached the Australian coast, their supply of fresh-water failed, and when at length they made the shore, which they did at First Red Rock Point, south of Cape Direction, lat.  $13^{\circ} 4' S.$ , long.  $143^{\circ} 32' E.$ , their first thought was the alleviation of their thirst. Leaving the boat, they wandered along the shore, until at length they found a small quantity of water, the whole of which was eagerly drunk by the men, leaving none for the poor little cabin-boy, half-dead with hunger, thirst, exposure, and fatigue, and whose feet were cut to pieces by the sharp coral of the reef. Their thirst having been quenched, the captain and his men—eight in all—returned to their boat, and sailed away again, leaving the boy to die by the empty water-hole. They reached New Caledonia in safety, and there the captain reported the loss of his vessel, and the hardships which he and his companions had undergone. He did not, however, report his abandonment of Narcisse Peltier.

The Chinese left at Roussel Island were, it was afterwards ascertained, gradually killed and eaten by the natives, with the exception of some twenty, who ultimately escaped.

The career of the boy Narcisse Peltier would undoubtedly have come to a close even before his captain's arrival in New Caledonia, had it not chanced that some blacks crossed the footprints left by the sailors in their search for water, and followed them up until they found the dying boy by the side of the dried-up well. They gave him food of a wretched kind, and then led him away gently by the hand to their tribe, with which he has remained uninterruptedly until the present time. He might never have been discovered at all, but for the accident of the *John Bell*, schooner, touching at Night Island, on the north-east coast of Queensland, on the 11th of April, when engaged in the *bêche de la mer* fishery. A party in the boats being despatched to the island in search of water, encountered a number of aboriginal blacks, with whom they found a white man, who was, like the blacks, perfectly naked, and appeared to be completely identified with them in language and habits. On these facts being reported to the master of the *John Bell*, he determined to make an effort to rescue the man, and with this view sent on shore the following day a large supply of articles of barter, which it was endeavoured to explain to the natives were intended to be exchanged for their guest or captive. The white savage was induced to enter one of the ship's boats, where he was given biscuit to eat, and told to sit

still, muskets being at the same time pointed at the natives, and fired over their heads, to induce them to retire, which they were very unwilling to do without being accompanied by the white man, whom they begged to return with them.

The *John Bell* brought her prize to Somerset, the settlement at Cape York, where he was clothed and cared for by the resident magistrate, Mr Aplin. For some days after his arrival, he sat the greater part of the day perched on the rail-fence of a pulldock, casting quick, eager, suspicious glances around him on every side and at every object which came within his view, rarely speaking, and apparently unable to remember more than a few words of his own language, although he said enough to shew that he was a Frenchman, and wrote down on paper, in a stiff, upright French hand, his own name and a few almost unintelligible sentences, which were subsequently found to contain a short account of his history. On the return to Cape York of Lieutenant Connor, R.N., who speaks French fluently, a good deal more was extracted from the savage, and it appeared that his name was Narcisse Pierre Peltier, or Pelletier, son of Martin Peltier, shoemaker at St Gilles, department of Vendée, France. At twelve years of age, he had embarked as a cabin-boy on board the *Sé Paul* of Bordeaux.

The account given of Narcisse is, that he is a short, thick-set, active man. His skin is of a bright red colour, and glazed upon the surface by continued exposure to the sun. He is clean in his person, and says that the blacks among whom he has lived are so also. Across his chest are two horizontal lines of raised skin, with other marks in the nature of tattooing, and designed for ornament. The lobe of his right ear has been pierced, and so also has his nose, for the admission of some rude decoration, probably a bit of the pearl-oyster. When first found by the blacks, he says he was very unhappy, often thought of his father, mother, and brothers, and longed to get away. In the course of time the recollection of them became less vivid and less painful, and he ultimately completely identified himself with the tribe. He had never made an attempt to escape, as being alone he could not have managed a canoe out at sea; and though he had often seen vessels passing along the coast, he had never been allowed to get near them, having been always sent by the blacks into the woods in the interior when they went on board a ship. It is not very clear how they came to allow him to be seen at last by the sailors of the *John Bell*.

The great length of time he had been in the hands of savages had obliterated early recollections, and he could hardly recall a word of French. A little practice, however, brought back his native language. He now speaks French fluently, and in proportion as it returns to him he forgets the language of his tribe, of which, however, about a hundred words have been collected from him and taken down. What is very much more remarkable, however, than his recovery of his mother-tongue, is the fact that he has not lost the powers of reading or writing after a disuse of seventeen years, during which he of course never saw a book, and, as he says, never wrote a line; nor, indeed, did the blacks know that he possessed the power

to do so. Very probably he did not know it himself. After two or three weeks' residence at Somerset, however, he wrote, as has already been mentioned, a few almost unintelligible lines. Before coming on board the *Brisbane*, he had much improved in intelligence, and pronounced correctly the names he saw written up on the boats and elsewhere about the ship. His progress since has been most rapid. He now spends a portion of every day in reading, though whether he understands all that he reads, may possibly be doubted. He displays considerable intelligence, but at the same time a childish dependence and imitativeness of others. That anything is done by *les autres* is sufficient to induce him to attempt it himself. He is generally good-humoured, though with occasional fits of apparently causeless sulkiness; he frequently coughs violently, and his habits of crouching about here and there are still those of a savage.

He is very bitter against the captain of the *St Paul* for deserting him, but at the same time appears to be afraid of him. He speaks with kindness of his family, which he distinctly remembers, but always maintains that they must all, even including his younger brothers, be now dead; and it would appear as if, having no measure of the time he has passed with the savages, the past appears to him at so vast a distance as to have given him the impression that he is extremely old, although in fact barely thirty. He says he wished to remain with the blacks, and, although he acquiesced in his removal, he is evidently by no means as yet either happy or satisfied.

The name of the tribe with which he has lived is Macadama. They have no kings, chiefs, or leading men among them, all the males being equal. The men, he says, are strong, but observes with pride that he himself is very strong, much stronger than the blacks. On the other hand, though he says he is a good swimmer and diver, he acknowledges that in the water the blacks far surpass him. The tribe subsists chiefly on fish, turtles, turtles' eggs, alligators' eggs, and roots and fruits. Sometimes they hunt animals, but apparently not often. The occupation of the men is fishing; that of the women, to gather roots, and sometimes also they get honey. They have no knowledge of nets, lines, or hooks. The larger fish are harpooned from canoes, the smaller speared with a three-pronged spear. The canoes are cut out of trees with knives formed of hoop-iron obtained from barrels washed up from wrecks. Of this hoop-iron also the heads of their spears and harpoons are made. Narcisse says he has himself constructed two canoes, which he has left behind him. He describes the condition of the women of the tribe as very pitiable, but that is generally the case in nations of savages. The blacks, he says, have no knowledge of any Superior Being, and no form of religion of any kind whatever. The dead are tied up with cords after the fashion of a mummy, and exposed to the action of the sun either in the forks of trees or on a rough scaffold. Rude as were the beings among whom he lived, they were not unkind to him, and he thinks they would treat any white man well. He states that he has heard that in his tribe there was an old white man who had lived among them for many years, and was at last drowned while out fishing. He does not recollect having seen this

man himself, and is not sure when his death occurred.

From these notes, it appears that Narcisse is by no means deficient in observation, and only needs cultivation to bring him forward. By latest accounts, he was to be handed over to the French Consul at Sydney, by whom he will probably be sent to France. We shall be glad to know that the captain who basely deserted him has been punished according to his deserts.

#### AN EVICTION.

'MARY, Mary! do you hear what the neighbours say—that we're all going to be evicted?' cried Denis Connor, entering his cabin one evening towards the end of October, and sitting down dejectedly; while Mary his wife looked up from her work in blank dismay.

'What do you mean, Denis?' she asked. 'Sure, we don't owe a penny of rent, and if the Lord spares us our health, we'll remain so.'

'It's too true, I'm afraid. O Molly, it'll break my heart to leave the old place; and what'll you and Oona do?' and the old man rocked himself to and fro, and moaned bitterly.

'Whist, Denis dear,' Mary said, gently placing her hand on her husband's shoulder: 'there's some mistake, ye may be certain. His Honour could not mean to turn us out, for sure there's no decenter poor people on all the property than the neighbours. It isn't like as if we were living entirely on the land, and couldn't pay the rent. His Honour couldn't mean to evict us, Denis!'

But His Honour did mean to evict them, as they learned formally a few days after; the entire village of Cloonabeg was to be swept away.

It was a wild bleak spot on the west coast of Ireland, not many miles from the ancient 'Citie of the Tribes.' The village consisted of a long straggling row of cabins, on the edge of a common, and within a stone's-throw of the sea. The inhabitants of Cloonabeg were fishermen, poor, simple, honest, hard-working people, who had been born in the cabins they dwelt in, and their fathers and grandfathers before them, and knew little of the world beyond. They all had the right of the common—on the other side of which stood the village of Cloonamore, a much more important place, which boasted the possession of a police barrack, a chapel, and a national school. There was little intimacy between the inhabitants of the two villages. The Cloonamore people were farmers, comfortable as farmers go in the west of Ireland, where they have to toil, and toil continually, to make the wretched land produce anything. They were very jealous of their neighbours down by the sea-side, who paid far less rent, and on the whole seemed not only to work less, but to be more comfortable.

The fishermen were quiet, proud, reserved people, who lived entirely to themselves, helping each other in difficulty, consoling each other in trouble, and taking little interest in anything save the coming and going of the shoals of fish.

They spent their evenings, when not out on the bay, with their wives; and it was pleasant to see them sitting outside their cabin doors, smoking their pipes, or mending their nets and sails—the

men in their rough home-knit blue guernseys, the women in their scarlet jackets. They were very poor, but then their wants were few, and they were contented and happy in their simple way.

Denis Connor was considered the most comfortable man in Cloonabeg. He had a son in America, who often sent him money; and a daughter married to a fishmonger in Galway, who was considered almost a merchant. One other child he had, Oona, a pretty golden-haired girl, the pet of the whole village.

In the next cabin to Denis Connor's lived a very old woman, named Merrick; poor Judy she was called, for she had had many troubles in her lifetime. Her husband and only son were drowned twenty years before, trying to save the crew of a brig which struck on 'Marguerite's Rock.' Young Merrick left a wife, who died a few months after, and one sickly little boy. Poor Judy took the child, and managed to bring him up and keep a roof overhead by constant hard work. She assisted the neighbours in their housework, who paid her in kind; and made and mended nets for any of the men who could afford to pay her a trifle just sufficient to pay the rent. For fifteen years Judy toiled late and early, and then her grandson Willie was old enough to take his father's boat and nets and earn his living, and support his grandmother. A fine, handsome, manly lad was Willie Merrick, full-chested, clear-eyed, and supple sinewed like the majority of the hardy sons of the sea-coast.

In the market, every one liked to buy his mackerel and haddocks, not only because they could depend on whatever he offered for sale being genuinely good and moderate in price, but they liked the look of his honest face and clear hazel eyes, and the sound of his hearty voice.

Mrs Merrick was proud of her grandson, and not without some reason, for he was a universal favourite, and deserved to be.

A few evenings after Denis Connor had told his wife of the threatened eviction, Oona, his daughter, was sitting with Willie Merrick on the stone seat outside old Judy's cabin. There was no 'take,' and the men were all about the beach attending to the drying of the nets, or watching a little boat which was making for the quay against wind and tide.

'She'll never get in, Oona, if they don't tack more to the east'ard,' Willie said. 'Oh, if I had a boat like her, wouldn't I be happy!'

'Aren't ye happy as ye are, Willie?' Oona asked. 'Ye told me the other night that ye was the happiest boy in Cloonabeg, or Cloonamore either.'

'So I am, darlin',' Willie said, looking tenderly at the fair saucy face beside him; 'but I'll be happier when yer my own intirely. When is it to be?'

'Whenever ye like, Willie; father and mother are willing, and yer granny is teasing me every day. Sure, we're all as one as married, aren't we, Willie?'

'Yes, darlin'; but I want the priest to spake the words, and put this on yer *weeshy* little finger;' and young Merrick pulled from his pocket a canvas bag, from the farthest corner of which he pulled a wedding-ring.

'This Shrovetide, then, Willie,' Oona whispered with a blush. 'Now, I must go in, as mother'll be wanting me. Is that the agent gone into

Martin Gill's, Willie? I didn't think it was rent-day yet.'

'Yes, faix, it is, Oona, and it wants a week yet to the half-year,' and Oona went into the house, while Willie went to see what the people were gathering into groups for, and talking so mysteriously about. A very few words served to explain the object of the agent's visit. He had come accompanied by the bailiff, to serve 'notice to quit' on every house. 'His Honour the landlord wanted the place cleared down,' was all the reason he gave. It was a sad thing to walk through the village of Cloonabeg that evening, and go from house to house with the agent. Everywhere he said the same thing: 'Ye must clear out; His Honour wants the place. I'll forgive ye half this half-year's rent all round, and give ye till the 1st of January to get away. But remember the men'll be here on New-year's Day to pull down these dens.'

By the time they had reached Denis Connor's, the whole village—men, women, and children—were after them, crying bitterly, and Judy Merrick came to ask what the matter was.

'It's evicted we are—served with notice to quit, Judy,' Mary Connor said quietly. 'It isn't easy to leave the place ye were bred and born in, and go out on the world. But God's good: cheer up, Denis avic.'

'What does she mean, Denis Connor?' Judy cried. 'Is it that they're goin' to dispossess ye—to turn ye out of the cabin ye were born in, and yer father and grandfather before ye?'

'Yes, ma'am; that's exactly what we mean,' the bailiff said. 'I'm going to serve you next.'

'Serve me! evict me! turn me, an old woman of threescore and ten, out on the roadside!' Judy screamed. 'No! I was born in that cabin; my father lived and died in it; my ancestors were the first that ever raised a stone of Cloonabeg. Old Judy, poor Judy, Judy Merrick, ye may call me, but I'm Julia O'Brien, and in the cabin I've lived in there I'll die.'

'We'll see about that,' the bailiff sneered, and Judy rushed out, and knelt down at her door-step. 'The first one of ye that crosses here will have to walk over me,' she shrieked; but the bailiff advanced, and laying his hand on her shoulder, gave her a printed form, and said jeeringly:

'You're served, Mrs Merrick; and I'd take it easier, if I were you.—Come on, sir,' he added, turning to the agent, who was examining the condition of the house.

Judy Merrick stood up, and looked at the notice in her hand, and then advanced to the agent's side. 'Mr Hayes, sir,' she said slowly, 'I'm to be out of this cabin on the 1st of January, amn't I?'

'Yes; and see that you are,' Mr Hayes replied.

'Where am I to go to, sir?'

'My good woman, that's nothing whatever to me,' he said, shrugging his shoulders; 'go wherever you like.'

'You know, sir, that in Cloonamore one of us can't get bit, nor sup, nor lodging, for love or money, even if we had that same. Where'll we go to, Mr Hayes, sir; will ye ask His Honour that?'

'That's nothing whatever to His Honour; he wants his houses, and I suppose he has a right to them. It's not every landlord would treat ye so well as to forgive ye a quarter's rent, and then give

ye two months' notice and nothing to pay,' the agent said.

'It's not every tenant that treats a landlord as well as we did. In my memory—and that's more than threescore years—he never lost a penny on one of these cabins, and one of us was never a day behind with sixpence o' rent. Can Cloonamore say that, Mr Hayes, sir? Go back to the big house, and tell His Honour that Judy Merrick is going to die in the cabin she lived in, or on the heap of stones ye level it to.'

'Come, come; that's all nonsense. See that you are out, bag and baggage, before the 1st of January,' the bailiff said, roughly laying his hand on the old woman's shoulder.

'Don't touch me, ye miserable creature!' she cried, shrinking back. 'Don't lay yer dirty hand on me, ye black-hearted villain. Look at him, neighbours, mark him, the evictor! It's all his doin's, and his'—pointing to the agent. 'Mark them, Willie! Don't forget their evil faces!'

'I'll not forget them, granny,' Willie Merrick said sternly, with quivering lips and flashing eyes; 'and if I ever have a chance, God help them both.'

'Och!' Judy cried, lifting up her hands; 'may God forget them at their greatest need, and forgive them like as I do now;' and then she went in and sat rocking herself for hours over the fire.

The 1st of January 185- was a bleak wild day, with a fierce east wind, driving a cutting, bitter sleet before it. The sea and sky, of a gray leaden hue, seemed to meet, you could scarcely distinguish one from the other; and the storm raged along the desolate coast.

The village of Cloonabeg presented a very pitiful sight that New-year's Day—a sight, once seen, never to be forgotten—a sight which impressed itself on the memory with burning intensity, the sight of an eviction! All words are inadequate to describe the scene—it is something one must look on to thoroughly comprehend. That morning, on the common, wherever a stunted shrub offered the faintest shelter from the bitter east wind, the people were sitting huddled together, or lying on their poor beds to keep themselves warm, waiting for the demolition of their cabins; women weeping bitterly, children shivering, and men with folded arms, set teeth, and blanched faces, men poor, ignorant, homeless, yet exercising a self-control wonderful and touching. The lane leading to the village was also lined on each side by the unfortunate people; and as the bailiffs came with picks to begin their work, the women greeted them with a terrible cry.

The men were silent, calmly, grandly silent. They could have easily beaten off the intruders—they could have chased them into the sea, or dashed their brains out against the rocks; but what would it avail; others would come and take their places, for Cloonabeg was doomed. The men looked passively on as they saw their homes levelled to the earth, as they saw cabin after cabin fall in.

Opposite their door, Denis Connor and his wife and daughter sat waiting for the end before starting for Galway. In vain they entreated Judy Merrick to accompany them; she would not leave her cabin. Grim and resolute she sat on her bed, and declared solemnly that out she would not go. And her grandson, Willie? Poor fellow, he was in

Galway jail on a charge of attempted murder. Mr Hayes the agent had been fired at, and without any hesitation he accused Willie Merrick, and the bailiff swore he heard the young man threaten him; so he was committed to stand his trial at the spring assizes.

When the men came to Mrs Merrick's house, and found her still inside, they paused in dismay, but the head bailiff's order came sharp and decisive: 'Go on!' and a shower of dust and stones about poor Judy's ears, shewed that they were going on without any mistake. Then Denis Connor rushed in, and seizing the woman in his arms, carried her out, just as the roof gave way; but he might as well have left her in her dearly loved cabin, for Judy Merrick was dead! The first desecrating blow struck to the roof which had so long sheltered her, had stilled her heart for ever.

All through that dreary winter-day the people sat shivering by the wayside, mourning over their ruined desolated homes, and at night some few of them were sheltered in barns and out-houses, while others lay under the hedges or on the fallen cabins. The next morning, vans came and took the very old and sick to the workhouse, and those who were able to walk and work went hither and thither in search of employment.

All this time His Honour the landlord was enjoying his honeymoon on the shores of Lake Lemane, and knew no more about the fearful scene enacted in Cloonabeg than his somewhat tenants knew about his locality. The agent thought the little village in the way; the common would, he fancied, make a valuable piece of pasture-land; and so he wrote to his master, and said the houses were only dilapidated dens; declared the tenants never did, or could, or would pay any rent; and that the best thing for all parties was to pull the cabins down, as the people would then emigrate to America. And so Mr Hayes evicted the people, and razed their homes to the earth! Such things have been common, and are still not unknown in the west of Ireland.

Months passed, and Willie Merrick still lay in jail awaiting his trial. At the assizes, there was not a shadow of proof against him, and one of the gamekeepers on an adjoining estate confessed that it was he fired the shot which wounded the agent; so Merrick was acquitted; and a few kind-hearted people subscribed enough money to pay his passage to America.

'You'll come out to me, Oona darling, won't you?' he said, holding his promised wife in his arms as he said good-bye. 'You aren't ashamed of me, are you?'

'No, Willie; but I'll not follow you to America,' Oona said sadly. 'I'm going a longer journey. O Willie, Willie, my heart is broken. You'll never look on the face of Oona Connor again! Good-bye, and may Heaven for ever bless you!'

Willie was pushed into the train which was to take him to Cork, and Oona fell fainting into her father's arms.

Three months after, there was a quiet funeral in the old graveyard of Cloonabeg, an old man and an old woman the only mourners.

Oona Connor was dead, and her last wish had been to sleep beside her brothers and sisters in the little country graveyard she had played in as a child. There she sleeps, with no cross at her

head or stone at her feet; but her grave is well known, and the memory of the events which caused her death green. No one in the west of Ireland has forgotten the Cloonabeg eviction.

### THE MONTH: SCIENCE AND ARTS.

THE Royal Commission appointed to inquire into the great question of the relations of government to science and scientific education, have brought their years of inquiry to a close, and delivered their final Report. They have taken a wide range, and heard many and divers opinions and statements; but they have not been led astray by sanguine advocates of plausible theories. Build a great national laboratory, say some, furnish it with all needful appliances, and a host of experimentalists will resort thereto, and develop chemistry and natural philosophy, and make the nation rich, and themselves famous. The Commission have been slow to believe in the existence of cases of scientific genius pining for want of encouragement, and they have not recommended that a big laboratory should be built at the national expense. But they do recommend that elementary and advanced science should be taught in schools, and that scientific research should, under certain conditions, be aided by grants of money. Science deals with laws of nature and with facts; hence, if education can be improved by the accurate methods of science, so much the better for the educated. Recently, the worshipful Company of Spectacle-makers entertained the Astronomer-royal at dinner. In his after-dinner speech, that learned gentleman told them there was but one man in London who knew how to make spectacles! The Company have resolved that henceforth that reproach shall not be theirs, and we may believe that in time a citizen and spectacle-maker will know something about optics and the physiology of the eye. If, as is anticipated, the labours of the Commission should result in the appointment of a Minister of Education, then education may come to mean something very different from what it is at present.

As everybody knows, there are some months of the year in this climate of ours in which we contrive to keep ourselves tolerably comfortable without sunshine. The convenience of being able to make use of an equivalent for sunshine is obvious, and is often exemplified in manufacturing operations. Even hop-growers have been known, in moments of despair, during a wet season, to lay armfuls of their precious plants before the kitchen fire; but, with that exception, we have never heard of a substitute for sunshine in agricultural operations, until now; and now, Mr W. A. Gibbs, of Chingford, Essex, has brought out a machine for drying hay by artificial means. With a portable stove and a swift fan he produces a blast at high temperature (four hundred degrees or more), and drives it into a long trough, down which the wet hay, or grass, slowly travels, continually stirred and shaken up by small levers, contrived for the purpose. The hot, dry air, rushing with velocity, at once licks off all the moisture, and converts 'partially made, but wet hay, into a thoroughly dry condition for the stack;' and, as is reported to the *Times* by a competent onlooker, 'we saw spoilt and musty hay dried into hay of fair ap-

parent quality and pleasant fragrance; and we saw freshly-cut grass, saturated with rain from a very heavy thunder-shower which poured down at the time, dried into hay of first-class colour, and possessing the rich malt odour peculiar to well-made hay.' The cost of converting fresh-cut grass into hay is two pounds per ton; if partially dried by the weather, the cost is not more than seven or eight shillings per ton. The inventor of the machine is of opinion that, even in fine weather, the quality of the hay would be improved by a spell of the hot-blast. As regards the economy of the operation: we are informed that there are in the United Kingdom about nine million acres of grass, natural and artificial; that they produce twelve million tons of hay, worth, on the average, four pounds per ton. The amount and importance of the total value may thus be easily seen; and any reader materially interested in the question may calculate the difference in value between hay properly dried and hay badly made under unfavourable circumstances. The late 'catching' summer will have prepared many minds for a solution of the question.

What to do with our sewage? is still a difficult problem to answer, either from the urban or the agricultural point of view. General Scott, whose endeavours in connection therewith we have before noticed, has just published 'A Compendious Statement of the Nature and Cost of certain Sewage Processes,' which is full of practical suggestion, and well worth consideration. There are five ways in which sewage may be utilised: (1) By irrigation of a farm, which will yield a small profit, say £300 a year for a town of 100,000 inhabitants; (2) purification of the fluid waste by chemical means, involving the lime method of precipitation, and the manufacture of dry sewage manure; (3) the cement process; (4) the improved calcination and manure process. As regards the merits of these several ways, we are told that 'each of the first two costs about fivepence per head per annum for the population; the third, in any town large enough to afford a market for cement, will yield an annual profit of nearly a penny per head; and the fourth may be made to yield a profit of more than three times that amount—apparently the extreme limit to which, as a matter of finance, the utilisation of liquid sewage can be carried.'

The fifth way which General Scott now puts forward bears a high profit. In this, the excretions are not mixed with water, but are kept separate and undiluted. The liquid portion contains ammonia, and this ammonia is valuable. It is possible to separate the liquid from the solid portion. The ammonia can then be separated from the liquid by a 'chemical process of extreme simplicity.' The liquid is passed through a series of tanks in which is a layer of phosphate of magnesia. This phosphate absorbs the ammonia. In other tanks, lime is used to arrest the phosphoric acid, which otherwise would be carried away in solution, and the resulting ammonio-phosphate of lime is treated with sulphuric acid, which removes the ammonia, and the solution thus obtained is concentrated, and set aside to crystallise. The phosphate of magnesia having been washed clean by the operation here described, can be used over and over again a number of times; but in the form of ammonio-phosphate it can be readily sold at £20 a ton. Meanwhile, the solid part of the excretions has

been dried and reduced to powder; and General Scott proposes to fortify this powder with a small quantity of the ammonio-phosphate, and so produce a fertiliser worth from L.6 to L.7 a ton. This method has been tried at Oldham with complete success, and measures are set on foot for its introduction into other towns. The annual value of the excreta collected in Manchester is at present L.7000. We are told that it would be L.177,000 under the new process, and that if the process were generally adopted, 'it would render this country independent of Peruvian guano, and at the same time lift an enormous load off the shoulders of urban ratepayers.' It would, moreover, prevent waste of money in unwise schemes, as, for example, in a town not forty miles from London where the sewage, at heavy cost, is pumped up a long hill to its outflow on a farm.

At mining-works in the Isle of Man there has been for some time in use a magnetic ore separator, which, as its name indicates, picks out from a mass of ore the portion which contains most iron. In the 'dressing' of ore—that is, preparing it for the smelting furnace—water is commonly used to effect the separation, and can be depended on where the kinds of ore are not of the same specific gravity. But when, as often happens, the same vein yields spathose iron, blende, iron pyrites, and copper pyrites, separation by hydraulic means is impossible, and the value of the ore in the market is lessened. Under these circumstances, Mr F. J. King invented the above-mentioned separator, which may be generally described as a wheel or series of wheels that can be magnetised at pleasure. The magnetism is sufficiently powerful to pass through the thin band by which the wheels are moved. The broken ore travels on this band: the lumps containing iron are retained by the magnetism, while all the others fall off; and in this mechanical way the separation is effected, and the good ore picked out ready for the market. Further particulars of this machine may be read in the forty-second annual Report of the Royal Cornwall Polytechnic Society.

The same Report gives information concerning pilchards which may be regarded as of national importance. In 1871, more than 135 millions, or 45,682 hogsheads, of those fish were sent abroad; while probably not more than one million were eaten in England. The price per hogshead varies from L.1, 6s. to L.5, 2s., and pilchard oil is worth from L.25 to L.40 per tun. The reason why, for the small home consumption, is, that fresh pilchards are too delicate to bear carriage to a distance, and that the cured fish are prepared in a way not generally agreeable to the palate of English folk. Whether for export or home use, the largest fish only are cured: the millions on millions of small ones being either released from the nets, or brought on shore and sold as manure. On the coast of France, the nets are made expressly to catch the little fishes. It has been proved by naturalists that the Cornish pilchard is identical with the French sardine. Why should not the shoals of small pilchards be turned to profit? Experiments were made in 1873 by Mr Fryer of the Salmon Fisheries Office, and now, in conjunction with Fox and Company of Falmouth, he produces Cornish sardines on a large scale at Mevagissey. These sardines are described as 'fully equal to any preserved in France or Spain.'

As our readers are aware, we have many times called attention to instances of the injurious effects on climate of the wholesale cutting down of forests. An interesting account, communicated some time ago to the Linnæan Society by Dr Shaw, furnishes an example of another kind, and shews us how the vegetation and climate of the wool-producing region of the Cape Colony are being changed for the worse by 'a persistent and greedy system of overstocking.' The region in question is known as the 'Midlands'; situate far in the interior beyond the Sneeuwberg range (or Snowy Mountains); and in the days of the first settlers was the pasture-ground of thousands of antelopes and other animals, which, following the rains, migrated from one end to the other. It is very different now.

When first introduced, the sheep thrived so in that prairie-like land that the settlers crowded it more and more with sheep. Soon the grass was all devoured, and plants and shrubs were attacked, and came to be the main resource of the flocks. The ground was consequently left to bush and scrub, and to obnoxious and poisonous herbs, and the intoxicating *Melica*—the 'dronk' grass of the Dutch colonists.

'The climate,' says Mr Shaw, 'necessarily became affected. The rainfall came down less certainly and oftener, in the form of thunder-torrents. Side by side with the attacks of the flocks the more subtle and insidious agency of a changing climate came into power. The hardy plants of the Karoo commenced to travel northwards, and added their energies to the extirpating of the indigenous and proper flora of the region, and being of a bitter and nauseous character, they enjoyed immunity, and were only eaten by sheep in circumstances of dire necessity. Sweet bush, such as *Lyciums*, vanished before them; and the *veld* has become what is called by the farmers, and indeed is now, a "bitter veld," and is rapidly becoming an extension of dreary, scrubby, half-desert Karoo.' Besides all this, the ground becomes harder, and the perennial 'springs weaker.

It is clear that if some remedial measures are not applied, this once prosperous region will become a wilderness. Dr Shaw is of opinion that the Cape government should 'experiment on the introduction of grasses,' and, 'by the construction of colossal dams, save the country, keep up the deep springs, and in connection therewith, rear the beginnings of forests, to modify and increase the rainfall.' Nothing stops the extension of the 'wild Karoo,' as Barry Cornwall calls it, so effectually as permanent moisture. As Dr Shaw says in conclusion: 'It is certainly a subject of alarm to the country when it is known that a drier season than usual entails poverty and death to an incalculable extent among our flocks in South Africa. Some tracts of country are poisoned by the extraordinary increase of the *Tripteris flexuosa*; and transport riders, with their oxen (our only carrying-power), have to travel through certain parts of the country without pausing, on account of the *Melica*, grasses which have increased within the past few years to a degree scarcely credible, and on eating which cattle become intoxicated to an alarming extent.'

In addition to advising the government, Dr Shaw should preach to the 'greedy' sheep-farmers, and warn them against making haste to be rich.

The floating swimming-bath on the Thames, by

Charing-Cross railway bridge, is supplied with filtered water. In experiments made to discover the best form of filter, it was found that specimens of the water strained through stone filters became putrid in the course of two or three weeks; while water strained through bags of cloth shewed no signs of alteration either to taste or smell. In fact, the men employed in the experiments on board a barge moored in the river, drank the bag-filtered water during two or three weeks, and water thus filtered is now supplied to the bath; but after all it is only comparatively pure.

At a meeting of the Institution of Mechanical Engineers, where these particulars were communicated, one of the speakers mentioned that, at the Burton-on-Trent breweries, 'the whole of the water used was spring-water pumped from the red sandstone, not only for brewing, but also even for rinsing the casks containing the fine ale that was sent to India. The use of water from the river Trent was carefully avoided, even for cleansing the casks, because if they were rinsed with river-water it was found to set the ale fermenting in some unaccountable way; and at those breweries it was therefore essential to use spring-water entirely free from all organic impurity.' Forty years ago, it was the practice to fill ships' casks with water direct from the Thames. During the first week or two of the voyage, the water turned 'sick' for a few days, and smelled badly; but after that became bright and palatable. But, forty years ago, the towns in the Thames valley did not pour their sewage into the river as they do now.

Railway signals which work without the help of human hands seem to offer some assurance of safety that has so long been desired by travellers. It is known that the distance-signals, worked by long wires, are liable to get out of order, and that there is a limit to the distance at which they can be placed. Mr Spagnoletti, chief electrician to the Great Western Railway, has invented an electro-magnetic signal which is well deserving of attention, inasmuch as it can be worked at any distance—at two or ten miles, as well as a hundred yards. The ordinary out-stretching signal-arm, with which we are all familiar, is attached to a rocking lever between two electro-magnets; these are connected with a battery in the ordinary way, and contact can either be made by a signalman touching a key, or by the locomotive pressing down a treadle. For night-service, coloured lamps can be worked as readily as the signal-arm.

To an outsider, the numerous signals at a railway station appear confusing and complicated. If this electro-magnetic signal were taken into use, no other would be required, and thus simplicity would come into play. In cases where the apparatus is worked by hand, a little copy of the signals in the signalman's box tells him whether the distant signal, far out of sight, is working properly or not. But, as before stated, the locomotive itself will set the signals; will leave a danger-signal standing in the rear; will ring a bell to announce its approach; and, on arrival at the next station, lets down the danger-signals first put up, raises the next, sends on the warning whistle, and so does all the signalling with the regularity of clock-work. Of course there must always be a sufficiency of battery-power to keep the magnets up to their duty: if this be done, the signal-post may be fixed in any place wherever it is likely to be most effective.

It is unfortunate, yet true, that things will get dirty even in an Art Museum. Plaster-casts, especially, shew the ill effects of dust, and hitherto no effectual means of cleaning them, except by washing, has been discovered. But to wash a plaster-cast without injury or risk is almost if not quite impossible. Under these circumstances, the Prussian government have offered a prize of a hundred and fifty pounds 'for the discovery of a new method of preserving plaster-casts from deterioration by repeated washings.' It is required that the method shall be applicable to all kinds of plaster and to all colours; and that the hardness of the cast shall not be diminished. Another prize, about five hundred pounds, is offered 'for a material for making casts of art-works, possessing the advantages of plaster, but which, without any special preparation, will not deteriorate by periodically repeated washings.' In this case the conditions are, that the new material must easily allow casting in original moulds; that it shall be strong enough for the largest casts; and that the colour, if yellowish, or any warmer tint, shall be even throughout. The consignments of specimens, with proper descriptions, are to be delivered at the Royal Prussian Ministry of Public Worship, Instruction, and Health, Berlin, not later than the last day of the present year.

Mr A. J. Harvey, who has advocated the establishment by government of a museum of popular astronomy, a people's geographical garden, and other beneficial schemes, now wishes to see a people's museum of human anatomy, physiology, and popular surgery, with a department of popular medicine, established in every large town. If this were done according to a plan which he sketches, Mr Harvey is of opinion that intemperance would disappear, that every one's muscles would be properly exercised, that the 'masses of this good and great country' would be saved from 'helplessly and piteously leaning upon an army of skilled physicians for peace of body,' and from the 'widespread vice and refuge of habitual indiscriminate medicine-taking.' If all this could be accomplished by the establishment of museums, a great deal would have been achieved long ago; but facts point to a different conclusion. There can be no royal road for educating the masses, as there can be none for the individual, and we all know that many of those institutions, established to educate the people in science and art, have degenerated into mere places of amusement.

## SEQUEL TO AN ADVENTURE.

WE are informed by the writer of an adventure with brigands on the Appian Way, near Rome—of which an account was given in this *Journal* for July 17—that its unpleasantness did not terminate with her return to the city. 'On the contrary,' says the writer, 'and so we were glad at last to leave them and the Eternal City itself far behind us.'

'How many times the story of our adventure had to be told on the evening of our safe return to Rome, I cannot say; but at last night came, and I retired from the hum and bustle around me. Rest, however, was sought in vain, for even when I did sleep, I was tormented by dreams of gleaming pistol-barrels, long-bladed knives, and—most

horrible of all—a beardless, thin, dark face, with a pair of shining, closely set eyes, from whose gaze I could never escape. Never had I so rejoiced at the approach of morning.

‘With the day commenced the arrival of *gendarmes, carabinieri*, messages from the Questura, &c. The curiosity of the authorities seemed insatiable, and extended even to our most private affairs.

‘As British subjects, however, we felt that we must ourselves take some active steps in the matter, and accordingly we called next day upon an official of high standing, and gave him an account of our misadventure.

‘Some time after this there came some personages from the Questura, asking us to go to the convent of San Andrea delle Fratte, in the empty cells of which some newly taken criminals were confined. These prisoners were to be submitted to our inspection, so that we might judge if any of them had been among the perpetrators of the outrage of which we had been the victims. Arrived at the convent, I waited with dread the passing of the criminals before me. I could not help thinking of these keen, shining eyes that had haunted my dreams, and I shuddered at the idea of again seeing them fixed on mine. Strange as it may seem, I actually felt relieved when the review was finished, and I found that *our brigands* had not been captured.

‘On the following day we received a similar message, and drove, as was demanded, to the Questura. Here we had to listen to the account of another attempt at robbery, more recent than that upon us, in which the brigands had been beaten off, and one of their number killed. At the end of the narration, instead of my being confronted with the living robbers, the clothes of the dead one were shewn to me, and I was asked if I recognised them! They held them up as if their late owner still tenanted them, and put the hat above, but in vain. They awoke in me no thrill of recognition, only one of horror and disgust.

‘Next day came another summons. This time we were requested to go to — Prison, formerly a *carceri* reserved for political offenders. Here we were suddenly brought face to face with three prisoners, who even my inexperience assured me were deeply versed in crime. One face, beardless, dark, thin, with prominent glassy eyes, that seemed to fasten themselves to mine, caught my attention at once; and as, with dumb horror, I gazed as if fascinated, my dream was forcibly recalled to me. I could not, however, be certain that this had been one of the robbers who had attacked us, and even when the prisoners were made to walk, run, and shout, I was still at a loss. I could not swear to any of them.

‘On comparing notes with my cousin, when outside of the prison, I found, to my astonishment, that we had each partially identified a different man! All these trying scenes of attempted identification, where our recognition might have been death to the recognised, had thus proved fruitless. We had not been able to identify any one.

‘The finishing touch was put to my grievances that evening, when I found in the salon an artist busily engaged in sketching my features. My face to be made public property, as that of the lady who had been attacked by brigands! I had borne many annoyances, but here my patience failed—it

was too much. I rose and left the room, glancing at the artist a look of indignation and scorn I believe not easily to be forgotten. We forthwith determined to leave Rome, and one day’s journey brought us to the peaceful retreat where I pen this, the sequel to our Adventure with Brigands.’

### HOLIDAY BOTANISING.

IN speaking of Botanising, and the pleasing occupation it offers, to ladies especially, during the summer and autumn holidays, the *Queen*—to which excellent paper we are indebted for the information—says:

‘In making observations on plants, their dwellings and their habits of growth, ladies have not only the benefit of attaining real knowledge, but they also have the great pleasure of having a definite object in their rambles. Nothing can be more dreary than the set walk day by day for a particular distance at a given hour, with nothing specially in view. But, if a search for a particular plant is to be made, the whole aspect of affairs is changed. The walk has an object, and the plants obtained furnish much interest in drying, in fixing in the herbarium, in naming and in dating, while, long after, the little collection affords means of pleasant reminiscences to all who have been of the party. Perhaps, even the time may come when the dried forms of the plants are all that we have to tell us of happy days past, and of loved companions gone for ever.

‘In collecting botanical specimens, as in other occupations in life, co-operation, if it can be secured, is a very good thing, and the more widely this co-operation can be extended the better.

‘We have just heard of a botanical society, particulars of which, we think, may be interesting to our readers, either in the way of inducing some of them to become members of it, or to plan and originate something of a similar character.

‘The society has a secretary who takes an active part in the management, and who does, as will be seen, a very large amount of work. Each member of the society collects and dries specimens during the annual holiday. Some of these, of course, he adds to his own collection; but he brings home more than he wants for himself, and all duplicates he sends to the secretary. At the same time, he furnishes the secretary with the names of any plants or specimens he may desire for himself. The surplus specimens of all the members form thus a stock, which the secretary distributes to the members at the end of the season, each member thus getting something new. We understand that, by this mode of co-operation, some of the members have got together magnificent collections of specimens. Of course, care must be taken in the preparation of the surplus specimens, at least as great as would be expended on those kept by the members for themselves. Both ladies and gentlemen are members of this society.’\*

\* Full particulars may be obtained by application to R. Tucker, Esq., 27 Cantelow’s Road, Camden Square, N.W. This gentleman is secretary, and would answer all communications.

## CURIOSITIES OF FEVER INFECTION.

IN our young days it used to be said that 'death was in the pot.' So many articles of meat and drink were adulterated with deleterious materials, that no one was thought to be safe. You might, as was averred, be poisoned in allaying thirst with a glass of beer. We fortunately do not now hear much of 'death in the pot.' Thanks to the law and magisterial vigilance, matters in that respect are considerably mended. In these later times, Death is busy in a different and unsuspected quarter. He insidiously approaches in odours from drains, from the pollution of rivers, and from fever contagion altogether unrecognisable by the senses. We have heard the late Sir James Simpson say that hospitals conducted on the ordinary plan, clean them as you will, are vehicles of contagion. You may scour their floors, scrape their walls, furnish them afresh, and yet the prolific germs of fever remain in them. The radical cure, as he said, was to construct the hospitals of cast-iron, and when contaminated, burn them, and cast them anew. Then, only, you would be safe. It is obvious that in the general intercourse of the world, great risks of infection are occasionally run.

Men of science speak of epidemic waves, and of scarlet fever being communicated by the few drops of milk which you pour into your tea, or the cream diffused in a dish of strawberries. On a late occasion, at a fashionable dinner-party in London, as many as eight or ten of the guests, and seven members of the household, took scarlet fever. Obviously, the infection must have been caught at the dinner-party; but *how* was the puzzling matter of inquiry, for no one in the family of the host was known to have been affected with the disorder. Was the disease brought to the house by a waiter? Was it conveyed in the table-linen from the washerwoman? Was it somehow incorporated in the cream that had been used in the dessert? An investigation on these and other points, as we understand, was made, but not with any satisfactory result. The cream was thought to be the most likely vehicle of infection; but how could

any one be certain on the point? The cream employed in fashionable dessert in London is possibly made up of half a dozen creams from as many dairies, and inquiry ends only in vague conjecture. Rather a hazardous thing, one would say, going out to dinner where you may run the chance of being killed in a manner so very mysterious.

People, in their innocence, are not aware of the manner in which contagious diseases may be communicated by public conveyances, by articles of dress, by dwellings, by the very atmosphere. We have just heard an instance of the communication of scarlet fever by means of a 'kist,' the name usually given in Scotland to a servant's trunk. A servant-girl in Morayshire fell ill with scarlet fever, and died. Her kist, a painted wooden box containing all her worldly goods, her later clothing included, was sent home to her relations, and lay for some weeks at a station on the Speyside railway before an opportunity occurred for removing it by a cart to her mother's cottage among the hills. During this interval, the station-master's children, in romping about, conducted their gambols on the kist, which was a repository of contagion, and in due course were struck down with scarlet fever. At length, the fatal kist was conveyed to its destination, and the contents were dispersed among friends and neighbours. The donations were kindly meant, but they proved fatal. No precautions had been taken to disinfect the articles, the result being that wherever the clothes of the deceased girl were taken in, scarlet fever found its victims. For several months the fever raged, until the wave of its infection was expended. Now ensued a remarkable event. The outbreak proved to be an opposing barrier to the spread of a more virulent type of scarlatina advancing from another quarter at a later period of the year. On reaching the former scene of the disease, it was arrested, for want of material to feed upon; a second attack being very unusual.

The next case of a similar kind to which we may allude occurred some years ago, and is worthy of note, from the distinctness of the evidence, as reported by a distinguished medical man who was

personally cognizant of the circumstances. It was briefly this: A soldier was seized with cholera in Dublin, and died, when his box, as in the previous case, was sent home to his relations in Scotland. In this instance, the clothes were submitted to the tub to be thoroughly washed. All right so far; but mark the strange way the contagion was communicated. The clothes were washed in an old thatched cottage, which happened to have some holes in the roof. At the time of the ablutionary operations, an aged thatcher was occupied in repairing the roof; and inhaling the hot poisonous fumes which eddied upwards, he became faint, and dropped in a state of insensibility. The old man was poisoned. After a few days' illness, he died of cholera, leaving a terrible legacy of disease to the village. This case was followed by about a hundred other cases, which proved more or less fatal.

Some time since, a lady from London, with her little daughter, were visiting a friend in the country, and, by a luckless incident, the child became affected with symptoms of scarlet fever in a way wholly unexpected. In walking out, the mother and daughter sat down to rest on the trunk of an old tree that lay along the roadside. This tree had been habitually visited by some village children just recovering from scarlatina. From this simple circumstance the little girl carried away the infection. She was for some weeks ill, but happily recovered.

Instances are known of contagious diseases being communicated by cats and dogs. One of these animals may carry in its fur infection from one house to another. Mr W. Lattimer of Carlisle, in a pamphlet on the subject of Contagion, mentions the case of a neighbour whose child died of scarlet fever of a malignant type, after twenty-eight hours' illness. Puzzled to account for the origin of the infection, he says, 'I requested my neighbour to see if there was anything in his house—any old clothing, or other matter, seriously charged with the seeds of contagion—that was doing mischief. He could find nothing; and after carefully disinfecting everything, he hoped that the evil was ended. But in two months another child took the same form of the disease, and died after twenty-two hours' illness. Becoming convinced that the poisoning agent was lurking somewhere, he made another investigation, and at length discovered that it was a retriever pup, which he had got about three months before, which had been reared in a friend's house where scarlatina was present, and where, very probably, the pup, through being fondled by the scarlatina convalescent, had got its woolly hair so charged with the contagious matter as to produce the malignant form of the disease in these two children. In reply to my inquiry, if they were in the habit of playing with the pup, the father said: "They were never off its back, rolling about the floor with it from morning to night."

The same writer proceeds to quote a remarkable case of disease communicated through the agency of mice, which is mentioned in a pamphlet by Dr McCall Anderson, Professor of Clinical Medicine in the University of Glasgow. Dr Anderson says: 'In the course of the year 1854, several members of a family, amongst whom was a young physician,

remarked that several mice, caught in a trap, were affected by a peculiar disease. Upon the head and front legs there were crusts of a sombre yellow tint, of a regularly circular form, and more or less elevated above the level of the neighbouring healthy parts. A manifest depression was likewise detected in the centre of each crust, and the parts where these had fallen off were ulcerated, and the skin appeared to be destroyed throughout the whole thickness. These mice were given to a cat, which exhibited, some time afterwards, above the eye, a crust similar to those on the mice. Later still, two young children of the family who played with the cat, were successively affected with the same disease, yellow crusts making their appearance on several parts of the body, on the shoulder, face, and thigh.' The above case naturally set medical men to look for others of a similar character; and Dr Anderson adduces instances where mice, affected in the same way, had transmitted the disease, both indirectly through cats, and directly through the mice themselves having been handled by children, to the human subject. As facts such as those become better known—that certain diseases are lurking in dogs, cats, mice, &c., that only want the opportunity of transplanting themselves into the human subject—an important step will have been taken towards a solution of the mystery of contagion, and towards the correction of that quasi-pious, but really fatalistic notion, only too prevalent, that all disease and premature death are unavoidable.'

A lady, wife of a London physician, lately gave her experiences as to the spread of fever in a paper in the *British Medical Journal*. From this paper, we draw the following particulars, by way of warning:

'Our immediate social circle has been somewhat disturbed lately by the outbreak of scarlet fever amongst us. The first question that arises is, Whence has it sprung? We are puzzled to know how, when, and where, we got upon the unseen track. Perhaps, the very history of our own experiences may explain how the mystery comes about. Lady D. was startled one day to find her eldest boy brought home from school in a cab, wrapped in blankets, and deposited in the hall in a blaze of eruption. The boy had naturally to be carried straight to a bedroom without any preparation for an infectious disease. The mother, nursing a baby five weeks old, was advised by her physician to leave the house at once with her younger children, and the sick-room was given over to the care of a nurse from a highly esteemed sisterhood. The printed rules of the establishment brought by the nurse were admirable, and might have been efficacious if carried out. Instead, however, of a cotton dress being worn, according to the rules, the nursing of this highly developed case of scarlet fever was conducted throughout in the black alpaca in which she arrived. When the peeling was over, and the child considered safe for the journey, this dress was changed for a private costume, to the woman's mind more suitable and becoming for the seaside. In the course of other six weeks, the house had been thoroughly disinfected, and all the bedrooms on the sick-room floor repapered and painted, the family had gone back, and the invalid was to return. Here, then, arose fresh dangers, not from the boy, but from the nurse, who had persistently broken the rules

she ought to have obeyed. It became necessary for her to change the surreptitious costume for the sombre dress of the establishment, and she desired to be shewn into a bedroom to effect the transformation. Fortunately, Lady D. was at hand, and forbade her the use of any of the rooms, and despatched her under protest to the scullery to open the dangerous box. The next scene was her departure in a cab in the infected alpaca of the sick-room, in which she duly appeared amongst the trusting sisterhood.

'Another friend has just informed me that her coachman is in affliction, owing to the death of his daughter last week, from scarlet fever. It seems the girl was in service in Richmond, when she fell ill, and was sent home. The process to be gone through before getting home was a cab to the station, thence in the train to Bromley, and thence another cab to the lodge on the estate where her mother lived. Here she arrived in the midst of the family circle, having suffered from sickness the whole way, in cabs and train alike, and here the unfortunate girl died a week from the day she arrived. The disease, pursuing its course, has since attacked another sister, who is lying dangerously ill at this moment.

'In contrast to the foregoing, I must relate a case of my own, in which the situation was curiously reversed. Some months ago, I received the intelligence that my boy, along with others at the same school, a few miles from town, was stricken with scarlatina, and had been removed to the infirmary. Finding next day that no rash had appeared, I resolved to have him home. Having given directions for the sick-room to be prepared, I proceeded forthwith to St George's Hospital to arrange about sending the fever-carriage for the boy. I found, to my dismay, although it proved ultimately for my good, that the carriage was impracticable, owing to the fact that it would not permit of two horses, and one could not accomplish the journey. I was compelled, therefore, to go to our livery-stable keeper, give him my confidence, and bind him over to take all necessary precautions afterwards. We had all the cushions removed, and air-cushions and a few washable wrappers put in, and a servant was despatched to bring back the patient. Meanwhile, the sick-room was prepared; and, for the sake of others, I may as well describe it. A well-ventilated room at the top of the house, cut off by a long passage from other rooms. The walls and ceiling are lightly papered and varnished; a slip of carpet is easily removed, leaving bare boards. No curtains, painted furniture, and an iron bedstead, with woven wire mattress, and a light hair mattress above. This is commonly called an hospital bed. The drawers were removed with their contents into another room, leaving the frame-work to serve the purpose of shelves. Disinfectants and a hot bath were in readiness. About 8 P.M., the carriage drove up, and a most hilarious invalid bounded forth an emancipated slave! He had eaten all the oranges, enjoyed the drive, and exercised his lungs in puffing out the air-cushions. Although the child had actually been in the infirmary mixed up with some severe cases, beyond a little sore throat, the disease did not develop, and he escaped. Since then, I have been to Brighton with my children in pursuit of health, and found, in the course of a few days, I was in the same "mansion" with a family

affected with the measles. Not a word of warning was given to me. I went a refugee, and returned a fugitive.'

With a constant liability to catch infection from circumstances purely accidental, it is nevertheless certain that the exercise of common-sense in securing proper ventilation, in avoiding places likely to be contaminated by bad drainage and impure water, and in steaming infected articles, will go a great way in securing immunity. It is above all important to keep in remembrance that nothing carries away infection so readily as woollen articles of dress, woollen carpets, everything woollen. If in any doubt regarding these articles, by all means shun them, let them be burnt out of doors, allow no one to touch them. The case lately mentioned in these pages of a child dying of a fever caught from a doll was no fiction. The doll presented to her had been the plaything of a girl who had died of scarlet fever. Let families take care how they introduce second-hand dolls into their household.

As infection in spite of all precautions will take place, we would hint that in London and other large seats of population, it would be advantageous to establish boarding-houses, or sanatoria, to which infected persons could be immediately transferred, and there placed under the treatment of the family physicians to whom they are accustomed as patients. The want of retreats of this kind are keenly felt among the higher and middle classes of the metropolis, and we can only wonder that such have not long since been set on foot. It is not uncommon for people in good positions to be driven to their wits' end on the occurrence of a case of scarlet fever in their family. They can neither seclude the patient from the other members of the household, nor can they get lodging-house keepers to give them accommodation; while at the same time they shrink from making use of fever hospitals. A case has been mentioned to us of a lady, the keeper of a boarding-school, being unable to find an open door for a pupil taken suddenly ill with a contagious fever, and being obliged to rent an entire and ready furnished house for reception of the invalid. Two or three well-conducted sanatoria in the environs of the metropolis would be a welcome accession in the cause of suffering humanity. W. C.

## THE FLAG OF DISTRESS.

### CHAPTER XII.—A 'PASO DE CABALLO.'

THE promontory called Punta Pedro is not in San Francisco Bay, but on the outside coast of the Pacific. To reach it from the former, it is necessary to traverse the dividing ridge between the two waters—this a spur of the 'Coast Range,' which, running higher as it trends southward, is known to Spanish Californians as the San Bruno Mountains. Punta Pedro abuts from their base into the ocean; the coast in this quarter being bold and picturesque, but almost uninhabited. Here and there only the solitary hut of a seal-hunter or fisherman, with a small collection of the same near the Point itself, bearing its name, and a somewhat indifferent reputation. The Anglo-Saxon gold-seekers do not go there; it is only frequented by the natives. From San Francisco to Punta Pedro the road runs past Dolores—an ancient mission of the Franciscan

monks ; whose port was, as already stated, Yerba Buena, previous to becoming rechristened San Francisco. This route De Lara and Calderon have taken, getting into it by a cross-cut ; and along it they continue to ride, still at a gallop, with faces set for Dolores. They are not the only equestrians upon that road. The dust kicked up by their horses' hoofs has just settled down, when a second party appears, going in the same direction, though in a gentler gait ; for it is a cavalcade composed partly of ladies. It is a quartette, two of each sex ; and as the horses are the same already seen standing saddled in the courtyard of Don Gregorio, it is not necessary to give the names of the riders. These can be guessed. Doña Carmen is carrying out the instructions left by her father ; who, Californian fashion, supposed he could give his sailor guests no greater treat than a *paseo de caballo*, including an excursion to the old Dolores mission, without a visit to which no exploration of the country around San Francisco can be considered complete. It is not the least of the 'lions.'

Like most Californian damsels, Don Gregorio's daughter takes delight in the saddle, and spends some part of each day in it. An accomplished *equestrienne*, she could take a five-barred gate, or a bullfinch, with any of the hunting Dianas of England ; and if she has not ridden to hounds, she has chased wild horses, mounted on one but little less wild. That on which she now sits seems but half-tamed. Fresh from the stable, he rears and pitches, at times standing erect on his hind legs. For all, his rider has no fear of being unhorsed. She only smiles, pricks him with the spur, and regardlessly strikes him with her *cuarto*. Much after the same fashion acts Inez ; for she too has learned the Californian style of equitation. The two present a picture that, to the eye unaccustomed to Mexican habits, might seem somewhat *bizarre*. Their mode of mount, as already said, *à la Duchesse de Berri*, their half-male attire, hats of vicuña wool, *calzoncillos* lace-fringed over their feet, buff boots, and large rowelled spurs—all these give them an air of picturesqueness. And if appearing bold, still beautiful, as the South Sea wind flouts back the limp brims of their sombreros, and tosses their hair into dishevelment ; while the excitement of the ride brings the colour to their cheeks, with flashes as of fire from their eyes.

The young English officers regard them with glances of ardent admiration. If they have been but smitten before, they are getting fast fixed now ; and both will soon be seriously in love. The *paseo de caballo* promises to terminate in a proposal for a longer journey together—through life, in pairs. They are thus riding : Crozier alongside Carmen, Cadwallader with Inez. The officers are in their uniforms ; a costume for equestrian exercise not quite ship-shape, as they would phrase it. On horseback in a naval uniform ! It would not do on an English road ; the veriest country lout would criticise it. But different in California, where all ride, gentle or simple, in dress of every conceivable cut and fashion, with no fear of ridicule therefor. None need attach to that of Edward Crozier. His rank has furnished him with a frock-coat, which, well-fitting, gives a handsome contour to his person. Besides he is a splendid horseman—has hunted in the shires before he ever set foot aboard a ship. Carmen Montijo perceives this. She can tell it with half a glance. And it pleases

her to reflect that her escorting cavalier is equal to the occasion. She believes him equal to anything.

With the other pair the circumstances are slightly different. Willie Cadwallader is no rider, having had but scant practice—a fact patent to all—Inez as the others. Besides, the mid is dressed in a pea-jacket, which, although becoming aboard ship, looks a little *outré* in a saddle, especially upon a prancing Californian steed. Does it make the young Welshman feel ridiculous ? Not a bit. He is not the stuff to be humiliated on the score of an inappropriate costume. Nor yet by his inferiority in horsemanship, of which he is himself well aware. He but laughs as his steed prances about—the louder when it comes near throwing him.

How does he appear in the eyes of Inez Alvarez ? Does she think him ridiculous ? No. On the contrary, she seems charmed ; and laughs along with him, delighted with his naiveté, and the courage he displays in not caring for consequences. She knows he is out of his own element—the sea. She believes that there he would be brave, heroic ; among ropes the most skilled of reefers ; and if he cannot gracefully sit a horse, he could ride big billows, breasting them like an albatross.

Thus mutually taking each other's measure, the four equestrians canter on, and soon arrive at the Mission. But they do not design to stay there. The ride has been too short, the sweet moments have flown quickly ; and the summit of a high hill, seen far beyond, induces them to continue the excursion. They only stop to give a glance at the old monastery, where Spanish monks once lorded it over their red-skinned neophytes ; at the church, where erst ascended incense, and prayers were pattered in the ears of the aborigines, by them ill understood. A moment spent in the cemetery, where Carmen points out the tomb inclosing the remains of her mother, dropping a tear upon it—perhaps forced from her by the reflection that soon she will be far from that sacred spot—it may be, never more to behold it. Away from it now ; and on to that hill from which they can descry the Pacific !

In another hour they have reined up on its top, and behold the great South Sea, stretching to far horizon's verge, to the limit of their vision. Before them all is azure and beautiful. Only some specks in the dim distance, the lone isles of the *Farralones*. More northerly, and not so far off, the 'Seal' rock, and that called *de Campana*—from its arcade hollowed out by the wash of waves—bearing resemblance to the belfry of a church. Nearer, a long line of breakers, foam-crested ; and nearer still, the strip of stony beach, backed by a broad reach of sand-dunes—there termed *medanos*.

Seated in the saddle, the excursionists contemplate this superb panorama. The four are now together, but soon again separate into pairs, as they have been riding along the road. Somehow or other, their horses have thus disposed them ; that ridden by Crozier having drawn off with the one carrying Carmen, while the steed so ill managed by Cadwallader has elected to range itself alongside that of Inez. Perhaps the pairing has not been altogether accidental. Whether or no, it is done ; and the conversation, hitherto general, is reduced to the simplicity of dialogue.

To report it correctly, it is necessary to take the two pairs apart, giving priority to those who by their years have the right to it. Crozier, looking abroad over the ocean, says: 'I shall ere long be upon it.' He accompanies the speech with a sigh.

'And I, too,' rejoins Carmen, in a tone and with accompaniment singularly similar.

'How soon do you think of leaving California?' queries the young officer.

'Oh, very soon! My father is already making arrangements, and expects we shall go away in a week, if not less. Indeed, he has this day been to see about taking passage for us to Panama. That's why he was not at home to receive you; leaving me to do the honours of the house, and apologise for his seeming rudeness.'

For that certes no apology was needed, and Crozier is silent, not knowing what next to say. Love, reputed eloquent, is often the reverse; and though opening the lips of a landsman, will shut those of men who follow the sea. There is a modesty about the latter, unfelt by the former, especially in the presence of women. Why, I cannot tell; only knowing that, as a rule, it is so, and certainly in the case of Edward Crozier. In time he gets over his embarrassment, so far as to venture: 'I suppose, Doña Carmen, you are very happy at the prospect of returning to Spain?'

'No, indeed,' answers Don Gregorio's daughter. 'On the contrary, it makes me rather melancholy. I like California, and could live in it all my life. Couldn't you?'

'Under certain circumstances I could.'

'But you like it, don't you?'

'I do now. In ten days from this time I shall no longer care for it.'

'Why do you say that, Don Eduardo? There's an enigma in your words. Please explain them?' While asking the question, her gray-blue eyes gaze into his with an expression of searching eagerness, almost anxiety.

'Shall I tell you why, señorita?'

'I have asked you, señor.'

'Well then, I like California now, because it contains the fairest object on earth—to me the dearest, since it is the woman I love. In ten days, or less, by her own shewing, she will be away from it; why should I care for it then? Now, Doña Carmen, I've given you the key to what you have called an enigma.'

'Not quite. But perhaps you will pardon a woman's curiosity, if I ask the name of the lady who thus controls your likes and dislikes as regard our dear California?'

Crozier hesitates, a red spot starting out upon his cheek. He is about to pronounce a name—perhaps adding a speech, the most important he has ever made in his life, because laden with his life's happiness, or leading to the reverse. What if it should be coldly received? But no; he cannot be mistaken. That question, asked so quaintly, yet so impressively—surely it courted the answer he intends giving it? And he gives it without further reflection—her own name, not an added word: 'Carmen Montijo.'

'Eduardo,' she asks, after a pause, dropping the Don, 'are you in earnest? Can I take this as true? Do not deceive me—in honour do not! To you—and I now tell you—I have surrendered all my heart. Say that I have yours!'

'I have said it, Carmen,' he too adopting the familiar language of love. 'Have I not?'

'Sincerely?'

'Look in my eyes for the answer.'

She obeys; and both coming closer gaze into one another's eyes; the flashes from the blue crossing and commingling with those from the brown. Neither could mistake the meaning of the glance, for it is the true light of love, pure as passionate. Not another word passes between them. The confession, with its dreaded crisis, is past; and, with hearts quivering in sweet content, they turn their thoughts to the future, full of pleasant promise.

Near by are two other hearts, quite as happy as theirs; though after a scene less sentimental, and a dialogue that, to a stranger overhearing it, might appear spoken in jest. For all, in real earnest, and so ending, as may be inferred from the young Welshman's final speech, with the reply of his Andalusian sweetheart: 'Inez, you're the dearest girl I've met in all my cruising. Now don't let us beat about any longer, but take in sail, and bring the ship to an anchor. Will you be mine, and marry me?'

'I will.'

No need to stay longer there—no object in continuing to gaze over the ocean. The horses seem instinctively to understand this; and, turning together, set heads for home.

#### CHAPTER XIII.—A 'GOLPE DE CABALLO.'

The bright Californian sun is declining towards the crest of the Coast Range, when two horsemen, coming from the Pacific side, commence ascending the ridge. As the sultry hours have passed, and a chill breeze blows from the outside ocean, they have thrust their heads through the central slits of their cloaks—these being *mangas*—leaving the circular skirts to droop down below their knees, while draping back, cavalry fashion, over the hips of their horses. The colours of these garments—one scarlet, the other sky-blue—enable us to identify the wearers as Don Francisco de Lara and Don Faustino Calderon; for in truth it is they, returning from the *pelen de gallos* at Punta Pedro. They have seen Diaz, and arranged everything about the duel. Faustino has finally determined upon fight. Instigated by his more courageous confederate, and with further pressing on the part of Diaz—a sort of Californian bravo—his courage has been at length screwed up to the necessary pitch; and kept there by the potent spirit of Catalan brandy, found freely circulating around the cock-pit. A flask of this he has brought away with him, at intervals taking a pull from it, as he rides along the road. Under its influence he has become quite valiant; and swears that, if he can but again set eyes upon the English *guardia-marina*, he will affront him in such fashion as to leave him no loophole to escape from being the challenger. *Carrai!* he will do as De Lara has recommended: cuff the young officer, kick him, spit in his face, anything to provoke the *gringo* to a fight—that yellow-haired cub without a *bigoté* or beard. And if the cur won't fight, then he shall apologise—get down upon his knees, acknowledge him, Faustino Calderon, the better man, and for ever after surrender all claim to the smiles, as to the hand, of Inez Alvarez!

With this swaggering talk he entertains his

companion, as the two are returning to town. De Lara, less noisy, is nevertheless also excited. The fiery Catalonian spirit has affected him, too. Not to strengthen his courage, for of this he has already enough; but to remove the weight from off his soul, which, after the scene at Don Gregorio's, had been pressing heavily upon it. Six hours have since elapsed, and for the first three he has been brooding over his humiliation, his spirit prostrate in the dust. But the alcohol has again raised it to a pitch of exaltation; especially when he reflects upon the prospect of the sure and speedy vengeance he is determined to take. It does not occur to him to doubt of success. With thorough reliance on his skill as a swordsman, he feels sure of it. Though also a good shot, he prefers the steel for his weapon; like most men of the southern Latinic race, who believe Northerners to be very bunglers at sword-play, though admitting their superiority in the handling of the pistol. As things stand, unlike his comrade Calderon, he will have the choice of weapons. His intended antagonist was the first to demand the card, and must needs be challenger.

As the two ride on, they talk alternately, both giving vent to their spleen—the man of courage as the coward. If not so loud or boastfully as his companion, De Lara expresses himself with a more spiteful and earnest determination; repeating much of what he has already said at an earlier hour, but with added emphasis. Once he has the English officer at his rapier's point, he will shew him no mercy, but run him through, without the slightest compunction. In vain may his adversary cry 'Quarter.' There can be none conceded, after what has that day passed between them. '*Maldiva!* it shall be a duel to the death!' he exclaims, after having given way to a series of threats, the words pronounced with an *impressione* that shews him truly, terribly in earnest. They have been carrying on this excited dialogue as their horses climbed the slope from the Pacific side, its steepness hindering them from going at their usual gait—a gallop. On rising the ridge's crest, and catching sight of San Francisco, with its newly painted white walls, and shining roofs, reflected red in the rays of the setting sun, De Lara, suddenly remembering the pressure upon him as to time, strikes the spur sharp against his horse's ribs, and puts the animal to speed. The other imitating his example, they dash on towards Dolores. They have no intention to make stop at the Mission. But, on reaching it, they draw up, obedient to the hail of a man seen standing in the door of a little tavern or *tinacal*, frequented by the lower class of native Californians. A rough, swarthy-skinned fellow, in a garb that proclaims his calling to have connection with the sea, though not that of a sailor. He may be a shore boatman—perhaps a *peacador*—though, judging by his general appearance, and the sinister cast of his countenance, he might well pass for a pirate.

Stepping a few paces out from the *tinacal*, he salutes the two horsemen, who have halted in the middle of the road to await his approach. Despite his coarse, brutal aspect, and common habiliments, he is evidently on terms of familiarity with both—the style of his salutation shewing it. It is with De Lara, however, his business lies, as signified by his saying: 'I want a word with you, Don Francisco.'

'What is it, Rocas? Anything about seal-skins?' asks the Creole, laying a significant emphasis on the last word.

'*Carramba!* No. Something of more importance than that.'

'Money, then?'

'Money.'

'Do you wish our speech to be private?'

'Just now, yes. Perhaps, in time, Don Faustino'—

'Oh!' interrupts the ganadero, 'don't let me stand in the way. I'll ride slowly on; you can overtake me, Don Francisco.'

'Do,' says De Lara, at the same time stooping down in his saddle, and continuing the conversation with Rocas, in tone so low as to prevent their speech being overheard by two queer-looking customers who have just stepped out of the *tinacal*, and stand loitering at its door.

Whatever Rocas may have said, it appears to make a vivid impression on the gambler. His eyes kindle up with a strange light, in which surprise is succeeded by an expression of cupidity; while his manner proclaims that the revelation made to him is not only important, as he has been forewarned, but also very pleasing. Their muttered dialogue is of brief duration; but ends with a speech which shews it to be only preliminary to a further conference.

'I shall be with you to-morrow, by midday.'

It is De Lara who has said this; after which adding: '*Adios, Don Rafael! Hasta mañana!*' he gives his horse the spur, and gallops to overtake his travelling-companion; Rocas sauntering back towards the tavern.

On coming up with the ganadero, De Lara rides on silently by his side, without shewing any desire to satisfy Calderon's curiosity. He but piques it by saying, that Rocas has made a communication of an intensely interesting kind; which he will impart to him, Faustino, in due time; but now there are other matters of quite as much importance to be attended to. The fighting is before them; and that cannot be set aside. Calderon wishes it could: for the flask has been some time forgotten, and the spirit has been getting cold within him.

'Take another pull!' counsels his companion; 'you may need it. We'll soon be in the town, and, perhaps, the first man we meet will be your yellow-haired rival.'

Scarcely have the words passed De Lara's lips when something in front fixes their attention. At some distance along the road a cloud of dust is ascending; in its midst a darker nucleus, distinguishable as the forms of horses with riders on their backs. There appear to be four of them, filed two and two. Plying their spurs, and galloping closer, the gamblers perceive that this equestrian party is proceeding in the same direction as themselves—towards the town. But they are soon near enough to know that such is not their destination. For, despite the enshrouding dust, they have no difficulty in identifying those who are before them. The horses are the same seen that morning, saddled and bridled, in front of Don Gregorio's house. Two of the riders are Carmen Montijo and Inez Alvarez; the other two— At this point conjecture terminates. De Lara, certain, and no longer able to control himself, cries out: '*Carajo!* it's they returning from their excursion—paired off, as I supposed they would

be! Now, Calderon, you have your chance, sooner than you expected. And without seeking—a lucky omen. There's your rival, riding by the side of your sweetheart, and pouring soft speech into her ear! Now's your time to set things straight—insult him to your heart's content. I feel like giving fresh affront to mine.'

He draws rein, bringing his horse to a halt. Calderon does the same. Scanning the equestrians ahead, they see them two and two, the pairs some ten or twelve paces apart. Crozier and Carmen are in the advance, Cadwallader and Inez behind. De Lara looks not at the latter couple; his eyes are all upon the former, staring with fixed intensity, full of jealous fire, with a glare such as only a tiger might give, as he sees Carmen turn towards her escorting cavalier, and bend over, he to her, till their heads are close together, and their lips seem to meet.

'*Carrui!* they are kissing!' exclaims the Creole, in a tone of bitter exasperation. He can bear it no longer. With a shout, half angry, half anguished, he digs his spur deep, and dashes forward.

The clattering of hoofs behind first warns Cadwallader, who is nearest to the noise. For, up to this time, the lovers, absorbed in sweet converse, dream not of danger behind. The young Welshman, glancing back, sees what it is, at the same time hears De Lara's wild cry. Intuitively he understands that some outrage is intended—a repetition of the morning's work, with doubtless something more. Quickly he draws his dirk, not now to be used in sport, for the mere pricking a horse, but in earnest, to be buried in the body of a man, if need be. This resolve can be read in his attitude, in his eyes, in his features. These no longer bent in a laugh of reckless boyhood, but in the rigid resolute determination of manhood. Badly as he sits his horse, it will not do now to dash against him. The collision might cost life—in all likelihood, that of the aggressor.

De Lara sweeps past him without a word; without even taking notice of him. His affair is with one further on.

But now, Calderon is coming up, clearly with the intent to assault, as shewn in his eyes. Suddenly, however, their expression changes at sight of the bared blade—that diabolical dirk. Despite the pull he has just taken from the flask, his courage fails him; and crest-fallen, as a knight compelled to lower his plume, he too passes Cadwallader, without a word, riding on after De Lara. He overtakes the latter, in time to be spectator of a scene in its commencement somewhat similar to that enacted by himself, but with very different termination.

Crozier, whose ear has also caught the sounds from behind, draws bridle, and looks back. He sees De Lara making towards him; and, at a glance, divines the intent. It is a *golpe de caballo*, or collision of horses—a common mode of assault among Spanish Californians. Instead of turning aside to avoid it, he of Shropshire determines on a different course. He knows he is upon a strong horse, and feels confident he can stay there. With this confidence he faces towards the advancing enemy, and after taking true bearing, spurs straight at him. Breast to breast the horses meet, shoulder to shoulder the men. Not a word between these themselves, both too maddened to speak. Only a cry from Carmen Montijo, a shriek from Inez

Alvarez, heard simultaneously with the shock. When it is over, Don Francisco de Lara is seen rolling upon the road—his horse kicking and floundering in the dust beside him. Regaining his feet, the Californian rushes to get hold of a pistol, whose butt protrudes from his saddle-holster. He is too late: Cadwallader has come up; and, dropping down out of his saddle, as if from a ship's shrouds, makes himself master of the weapon and its companion. Disarmed, his glittering attire dust-bedaubed, De Lara stands in the middle of the road, irresolute, discomfited, conquered. He can do nothing now, save storm and threaten—interlarding his threats with curses—'*Carajos!*' spitefully pronounced.

The ladies, at Crozier's request, have ridden on ahead, so that their ears are not offended.

After listening to the ebullition of his impotent spleen—Cadwallader all the while loudly laughing at it—Crozier, in serious tone, says: 'Mr De Lara—for your card tells me that is your name—take a sailor's advice: go quietly to your quarters; stow yourself out of sight; and stay there till your temper cools down. We don't want you to walk. You shall have your horse, though not your shooting-irons. These I shall take care of myself, and may return them to you when next we meet. The same advice to you, sir,' he adds, addressing Calderon, who stands near, equally cowed and crest-fallen.

After dictating these humiliating conditions—which, *volens, volens*, the defeated bravos are obliged to accept—the young officers remount their horses; and trot off to rejoin the ladies.

Having overtaken these, they continue their homeward ride, with no fear of its being again interrupted by a '*golpe de caballo*.'

#### CHAPTER XIV.—'HASTA CADIZ!'

On leaving Captain Lantanas, Don Gregorio returns to his house—though not direct. He has business to transact in the town, which stays him. He has to see Don Tomas Silvestre, the shipping-agent, and give directions about inserting the advertisement for sailors. That is an affair that will occupy only a few minutes. But he has another with the agent of a more important kind. He is intimately acquainted with Silvestre, who is, like himself, a Peninsular Spaniard and a Biscayan. Don Gregorio knows he can trust him, and does, telling him all he has told Lantanas, making further known the arrangement he has entered into for passages to Panama, and instructing him to assist the Chilean skipper in procuring a crew. The more confidential matter relates to the shipment of his gold-dust. He trembles to think of the risk he runs of losing it. San Francisco is filled with queer characters—men who would stick at nothing. Don Tomas knows this without being told. The thought haunts the hacienda like a spectre, that he will have his treasure taken from him by theft, burglary, or bold open robbery. He has good reason for so thinking. Among the latest accessions to the population of San Francisco all three classes of criminals are represented, and in no stinted numbers. There are ticket-of-leave men from Australia, jail-birds from the penitentiaries of the States, scape-the-gallows customers from every quarter of the globe; to say nothing of the native bandits, of

which California has its share. If known to these that gold-dust, to the value of three hundred thousand dollars, was lying unguarded in the house of Don Gregorio Montijo, it would not be there many days or nights. Its owner has done what he could to keep it a secret; but the sale and transfer of his land have leaked out, as also the handsome price obtained and paid over to him; hence the natural inference being that the cash must be deposited somewhere. And every one well knows it must be in gold-dust, since banks have not yet been established, and there are not obtainable notes enough in San Francisco to cover a tenth part of the amount. He has tried to convert it thus—as more convenient for carriage and safety—but failed. In fine, after confiding his fears to Silvestre, and taking counsel from him, he decides upon the plan, already in part communicated to Captain Lantanas—of having the endangered gold-dust secretly conveyed to the *Condor* as soon as possible. Don Tomas will provide the boat, with a trusty sailor-servant he has attached to his establishment, to assist in the removal and rowing. They can take it aboard without passing through the town, or at all touching at the port. The boat can be brought to the beach below Don Gregorio's house, and the gold quietly carried down to it. Thence they can transport it direct to the ship. Once there, Lantanas will know how to dispose of it; and surely it will be safe in his custody—at all events, safer there than anywhere else in San Francisco. So thinks Don Gregorio, the ship-agent agreeing with him.

Soon everything is settled; for they spend not many minutes in discussing the matter. The haciendado knows that by this time his house will be empty, excepting the servants: for the ride on which his girls have gone was arranged by himself to gratify his expected visitors. He thinks apprehensively of the unprotected treasure, and longs to be beside it. So, remounting the stout horse that brought him to town, he rides hastily home.

On arrival there he retires to his sleeping apartment, where he spends the remainder of the day, and gives orders not to be called till the party of equestrians come back. But although confining himself to the chamber, he does not go to bed, nor otherwise take repose. On the contrary, he is busy throughout the whole afternoon, getting ready his treasure for the surreptitious transport; for it is there in the room—has been ever since it came into his possession. Almost fearing to trust it out of his sight, he sleeps beside it. Some of it is in bags, some in boxes; and he now rearranges it in the most convenient form for carriage to the *Condor*, and safe stowage in her cabin lockers.

He has not yet completed his task, when he hears the trampling of hoofs on the gravelled sweep outside. The riding-party has returned; the *saguan*-bell rings; the heavy door grates back on its hinges; and, soon after, the horses, with the riders still on their backs, stand panting in the *patio*.

The master of the house sallies forth to receive his guests. He sees them hastening to assist the ladies in dismounting. But before either cavalier can come near them, both leap lightly out of their saddles, and, gliding into the corridor, fling their arms around Don Gregorio's neck; daughter and grand-daughter alike styling

him 'papa.' They are effusively affectionate—more than usually so—for this night both have a favour to ask of him. And he knows, or can guess, what it is. He has not been blind to what has been passing between them and the young English officers. He suspects that vows have been exchanged—a double proposal made—and anticipates a demand upon himself to sanction it. In both cases he is prepared to do so. For he is not unacquainted with the character and social standing of those seeking an alliance with him. He has been aboard the British frigate, and from Captain Bracebridge obtained information on these points. Satisfactory in every sense. Both the young officers bear an excellent character. Though differing in other respects, they are alike skilled in their profession—each 'every inch a seaman,' as their commander worded it. Besides, both are of good family; Cadwallader moderately rich, Crozier in prospect of great wealth; either of them fit mate for the proudest señora in Spain. His reason for supposing that on this day engagements have been entered into, is, that the young officers are about to take departure from the port. The *Crusader* is under Admiralty orders to sail for the Sandwich Islands as soon as a corvette coming thence reaches San Francisco. Captain Bracebridge has been commissioned by the British government to transact some diplomatic business with King Kamekameha. That done, he is to look in at Mazatlan, Acapulco, and some other Mexican ports, as also Panama, and Callao; then home—afterwards to join the Mediterranean squadron. As the *Crusader*, on her way to the Mediterranean, will surely call at Cadiz, the vows this day exchanged on the shore of the Pacific, can be conveniently renewed on the other side of the Atlantic.

At dinner—which is served soon after, and in sumptuous style—Don Gregorio makes his guests aware of the fact that he has secured passages for Panama, and may leave San Francisco as soon as they. He confides to them the secret of his having chartered the Chilean ship—in short, telling them all he has told her skipper—echoing the lament made by the latter about his difficulty in obtaining a crew.

'Perhaps,' rejoins Crozier, after hearing this, 'I can help him to at least one good sailor. Do you think, Will,' he continues, addressing himself to the young Welshman, 'that Harry Blew is still in San Francisco? Or has he gone off to the diggings?'

'I fancy he's still here,' responds Cadwallader. 'He was aboard the *Crusader* only the day before yesterday—having a shake hands with his old comrades of the fore-castle.'

'Who is the Señor Bloo?' asks the haciendado.

'A true British tar—if you know what that means, Don Gregorio—lately belonging to our ship, and one of the best sailors on her books. He's off them now, as his time was out; and like many another though not better man, has made up his mind to go gold-seeking on the Sacramento. Still, if he be not gone, I think I might persuade him to bear a hand on the craft you speak of. It was once Harry's sinister luck to slip overboard in the harbour of Guaymas—dropping almost into the jaws of a *tintorero* shark—and my good-fortune to be able to rescue him out of his perilous plight. He's not the man to be ungrateful, and if still in San Francisco, I think you

may count upon him for taking service on board the Chilian ship. True, he's only one, but worth two—ay, ten. He not only knows a ship, but on a pinch could take a lunar, and make good any port in the Pacific.

'A most valuable man!' exclaims Don Gregorio; 'would be worth his weight in gold to Captain Lantanas. I'm sure the Chilian skipper would at once make him his mate. Do you suppose you can find him?'

'If in San Francisco, yes. We shall search for him this very night; and, if found, send him either to the Chilian skipper, or to the ship-agent you've spoken of—Silvestre. By the way, what's his address?'

'Here,' answers Don Gregorio, drawing forth a card, and handing it across the table to Crozier. 'That's the place where Don Tomas transacts business. It's but a poor little shed on the shore, near the new pier, lately constructed. Indeed, I believe he sleeps there—house-rent being at present something fabulous.'

'This will do,' says Crozier, putting the card into his pocket. 'If Harry Blew can be found, he'll not be far from Silvestre's office, if not to-night, by early daybreak to-morrow morning.'

It is not the custom of either Spaniards, or Spanish-Americans, to tarry long over the dinner-table. The cloth once removed, and the ladies gone, a glass or two of Port, Xeres, or Pedro Ximenez, and the gentlemen also retire; not for business, but recreation out of doors, so pleasant in southern climes.

Doña Carmen with her niece have ascended to the azotea, to enjoy the sweet twilight of a Californian summer; whither they are soon followed by Crozier and Cadwallader. The master of the house has for a time parted with them—under the excuse of having affairs to attend to. It is to complete the packing of his gold-dust. But, while emptying their last glass together, he has been approached by the young officers on that subject uppermost in their thoughts, and dearest to their hearts; asked if he be agreeable to become the father-in-law of one, and the—Cadwallader had difficulty in finding a word for it—grandfather-in-law of the other. To both he has given the same answer—'Yes.' No wonder that, with bright faces and bounding step, they spring up to the house-top, there to rejoin the señoritas.

Their tale told to the latter—who have been awaiting them in anxious expectation—will save both a world of confusion and blushes. No need now for *them* to talk to 'papa.' His consent has been obtained—they are aware he will keep his word.

Again the four, now formally betrothed, separate into twos, taking opposite sides of the azotea. They converse about the far future—that awaiting them at Cadiz. But the ladies cannot overlook or forget some perils more proximate. The retrospect of the day throws a shadow over the morrow. The encounter with De Lara and Calderon cannot end without further action. Not likely; and both aunt and niece recall it, questioning their now affianced lovers—adjoining them to refrain from fighting. These reply, making light of the matter—declaring confidence in their own strength and skill, whatever be the upshot—so assuring to their sweethearts that both believe

them invincible, invulnerable. What woman is there who does not think the same of him who holds her heart?

Time passes; the last moments speed silently, in the old, old ecstasy of all-absorbing, tale-telling love.

Then the inevitable 'Adios!' though sounding less harshly by favour of the added phrase, '*Hasta Cadiz!*' [Till we meet at Cadiz!]

## WATERSIDE SKETCHES.

WE have read with much pleasure a work on angling, written somewhat in the gossiping style of old Isaac Walton, entitled *Waterside Sketches, a Book for Wanderers and Anglers* (London, Grant & Co.); the author, W. Senior, being personified as Red Spinner. According to this authority, there is a material difference between an angler and a fisherman. The angler is endued with the poetry of his art, is a lover of nature, and does not fish merely for the sake of filling his basket. The distinction, we fear, is more fanciful than real. Let us, however, give Red Spinner sufficient line to expatiate on the subject, for the benefit of the craft.

'Do you,' says he, 'smile at the high character given to so simple an occupation? Then you know not how fertile are the sources whence spring the angler's joys. When the north winds blow, and the east winds bite, and the yellow floods overflow the spongy banks, and the fisher is a prisoner at home, he forgets, in overhauling his stock, both his ill-luck and the friendly elements. He sits at the blurred window with his scissors, waxed thread, varnish, feathers, fur, and wool, spread out before him; he tests his lines and casts, oils his winches, and resolves himself into a committee of inquiry respecting the joints and tops of his rod, which he regards as companions to be communed with, praised for merits, and remonstrated with for faults. Rest satisfied, therefore'—and here he brings us back to 'Our Opening Day'—'that friends who are now with us, and have brought their instruments into the light for the first time since autumn, have set about their task in the spirit of no common or vulgar ransackers.'

Red Spinner is betimes upon the water, yet the trout have not bleared his mental vision to more elevating thoughts. 'They can wait for us a few minutes,' says he. '*En passant*, I would advise you never to hurry by this corner with your eyes shut, for as the April days multiply there will appear in all their vernal glory a host of marsh flowers and plants. The village children, romping and hallooing in the distance, are bound for the copse, to search out wood anemones, the woodruff, the wild hyacinth, lords and ladies, strawberry blossoms, primroses, violets, crane-bells, and (as they will call them) daffy-down-dillies; but our ruddy-faced little friends are too early in the season, and will meet with but a portion of the treasures they seek.'

Now, let us pause at the weir and watch one of our comrades do his will with the phantom minnow. If he handles his papers at the Circumlocution Office as well as his spinning-rod, he ought speedily to reach a distinguished position in the Civil Service. But he does not find a fish instant, nor will he succeed until the cast places his bait in command of the furthest eddy and scour. This in due time he neatly accomplishes,

and his reward is a vicious snap, a taut line, and a thrilling rod. 'It is a heavy trout, as you may see by the pull; a lively trout, from the speed with which he darts round and across the pool; an artful trout, by his rush for the shallows; a beautiful trout, self-proclaimed in a succession of leaps into the air, during which the sun lights upon his ruby spots and burnished vesture; a princely trout, as you must admit, for the keeper, who knows that the first fish of the season is always an extra coin in his pocket, stands by with the weighing-machine, and announces him a few ounces short of five pounds. He is a goodly fish; yet personally I hold him in light respect, being convinced that nothing would ever induce him to rise at a fly. We have been long familiar with these lusty trout, with their haunts, their vices, their virtues, their dispositions. Sometimes they take a clumsy dead gorge bait, sometimes a live roach or gudgeon, sometimes minnow or worm, but *never* a fly, artificial or real.'

'Never' is a strong term, good Red Spinner. You take small trout with small flies; did you ever try large trout with larger flies? We have, and are fully assured that if proportionately sized flies were offered to these large trout, the result would be far different. This season (1875) a trout of full the weight here mentioned has been taken with a grisle fly in the Thames; and we were present but a few years ago when a celebrated salmon-fisher—impressed with the conviction that some leviathan trout inhabited the weir-pool at Shepperton, which could not be induced to take the several tempting baits above enumerated—hooked and held in captivity three trout quite long enough to declare the weight of each to exceed twelve pounds; but lost them by a series of accidents which rarely occur but to the salmon-fisher. We have the more excuse for thus putting in our say, as Red Spinner, in the very next paragraph, upholds his own inspiration against all comers, although he does not pronounce it with the same claim to experience that we have ventured to do.

'We are now, let me whisper, making our way to a tributary streamlet, upon whose rippling surface the flies dangling over my shoulder will receive their first baptism. The brotherhood have various tastes, and agree to differ with perfect good-humour. Our friends are not unfriendly to me personally, but they pity my weakness for fly-fishing. I dote on our victorious young comrade of the weir, but nothing could induce me to toil throughout the livelong day spinning for a brace of trout, if the chance remained for me of a dozen troutlets fairly killed with the artificial fly.'

Though artificial flies are used of every size and colour, and rejoice in names such as Green Drake, Coch-y-bondu, Candlestick-maker, Dusty Miller, Chimney-sweep, Sir Francis Sykes, Parson, and Policeman, there are anglers who require none of these special baits to secure the best of fish, but who pin their faith to a book of judiciously assorted flies. Those two lurching vagabonds lounging upon the hand-rail of the rustic bridge that spans the ford, would laugh to scorn, did they dare, at your 'admirals' with cockatoo tails, and 'nobblers' with full dubbing, for *they* have an art which surpasseth show, unless it is the show of the brace of fine trout you have marked as your own over-night, and are bought, before you rise, for a

gallon of ale by your landlord, for your breakfast in the morning!

Still, we have been, perhaps, a little too hasty in concluding that small flies are the especial or exclusive favourites of Red Spinner. He tells us: 'As it is a small stream, of course, on that strange law of contraries which guides the angler in these matters, *full-sized flies* must be employed'—such as the March brown, blue dun, &c. 'You cannot detect the ghost of a rise anywhere, and cast after cast ends in monotonous disappointment.' He confesses he is not orthodox, but not in the matter we would hold him to. If large flies obtain to the limit of such as the March brown, why not pass the threshold, and try the diet of the grisle, or the higher cuisine of the salmon? But Red Spinner answers us by his perseverance, and loops on a fly in April that is considered as useless until May—the red spinner. But we must let him tell his own story in his own simple and sportsmanlike fashion—how he broke down rooted prejudice.

'One method is left untried. I plump down upon my bended knees, well away from the brink, winch up the line to a few yards, and cast close under the opposite bank, upon it if possible, and rather below than above. . . . The flies sink somewhat, are borne with the stream, and I am keeping my eye closely upon the red spinner, which the wind dances upon the surface, and which it is my intention to work slowly, dibbling fashion, across to the hither bank. In a few minutes I feel a trout, and I want no information as to his quality; he has shot athwart stream with a deep, strong pull, and bent my light rod like a whip. He was lying almost close to the bank on my side of the water, and never broke the surface in seizing the fly; he waited until the red spinner dipped, and then in a business-like way closed upon him once for all; and once too often. There is much that is practical in the above, especially the golden rule of keeping out of sight of your fish, and we recommend it to the tyro; but it all tends to prove what we have advanced, and we leave that part of the subject to those who will take our suggestions to heart.

'The Mayfly' is a charming chapter, redolent—yes, Mr Red Spinner, redolent in the poetic sentiment. Not satisfied with your own enticing cadences, you must sing in concert with Tennyson, and tell us that 'the brook which you have in your mind's eye has its forget-me-nots, and the cresses and the shallows, and all the melody which tinkles in the Poet-laureate's exquisite song.' Then pinning us in a corner of a first-class carriage, you warble forth: 'How fresh the country looks in its May garment of many colours; how majestically the sun rolls behind the great hills, towards which I am rattling in the ravenous express! As if the landscape is not already gay enough with its foliage and flowers, the sun clasps it in a parting embrace, and at the touch it becomes radiant, and rosy, and soft.' Why, Charles Mackay, when he replied in verse to 'There is no poetry in railways,' scarcely did it better.

Further on in his May-flying rambles, our enthusiast finds the sun beating fiercely upon him on his way to Brawl Mill. 'The road,' he tells us, 'lies over a stiff hill country, and the valley of the Brawl is far beneath us, a lovely panorama of English scenery. The stream meanders through its course, a mere thread of silver

from this distance. Two gentlemen, with a keeper in the rear, are whipping away, now and then resting to mop the perspiration from their foreheads, and appearing to us from our elevation no bigger than the Shem, Ham, and Japhet of a Lowther Arcade Noah's Ark. The driver knows them to be both peers of the realm; one of them owns the estate, and is a man of note in the racing world.

'Every year at the first appearance of the Mayfly his lordship is telegraphed for wherever he may be, and the earliest train brings him and a companion or two to the nearest station. They take quarters at a roadside inn (where we halt to water our recking horse), and remain there until the fly has gone, enjoying the sandy floor, the fitches of bacon on the rafters, the bunches of lavender in the drawers, and the fragrant snow-white bed linen. The only member of the party who seems put out by a temporary residence at this rural hostelry is the earl's *valet de chambre*: Monsieur Adolphe has, I regret to state, taught the rustics the use of the word *sacré*, and saturates himself with *eau de Cologne* night and day, that he may not be polluted by the hinds and dairymaids about him.

'Brawl Mill might be a bodily transfer from Switzerland, nestling there as it does in the silent hollow, with a slope of dark pines rising straight from its little garden on the hillside, with its drowsy old water-wheel, with its farmyard poultry and pigeons, with its wide porch smothered in roses, with its wooden loft steps, gray granary, and primitive outhouses. It is shut out from the turmoil of the world; not another human habitation is visible from the higher garden. It possesses two gardens—the first gained by ascending a flight of ashen steps above the mill; the second reached by similar means to where, below the house, the stream, after being released from the mill, tumbles over a fall.

'Further down, the Brawl deserves the name I have bestowed upon it: it ripples and complains, it frets and hurries away to find its level in a water-mead beyond. Above the mill the stream is wide and placid, as if conscious of its usefulness in feeding the hatches communicating with the mill, and desirous of sticking to its post of duty to the last. A bank of impenetrable weed, filling half of the river-bed, affords hiding-place for the trout, albeit it compels you to bring all your strength and ability into play to send your fly freely and gently across the stream; and a morass of rushes adds to the difficulty. The water is too clear, the sun is too bright; the fishable spaces do not give sign of a fin, and the flies alight and float down unnoticed. A stranger would not hesitate to pronounce the river untenanted as an empty house.

'Ladies greet us here. I never yet knew the angler who regretted their society by the riverside, and there is one sauntering up the lane who has herself graduated with credit in bank-fishing. They have been rambling, and the children gleefully display the flowers they have gathered. Little Rosebud asks me to accompany her a field or two down the stream to pluck the forget-me-nots her small arm cannot reach. These sunburnt folks are spending their holiday at the old mill-house, and have much to tell me of bird, and beast, and fish.

'Little Rosebud, let me inform you, has often aforetime been my companion at the waterside.

She can distinguish a roach from a dace, and a trout from a pike, should the pike happen to be large enough, and she will trot along proud as a queen if allowed to carry the landing-net. So, yielding to the fair-haired tempter, I lay aside my rod, and stroll lazily along on the banks of the Brawl, inwardly making observations to guide me in the evening's fishing. Little Rosebud, it seems, has seen a kingfisher, and last night she heard an owl hooting in the pine-wood. A prostrate trunk invites us to spend an idle half-hour in a sweet natural bower, from which we can command a capital view of one of the best bends of the stream. It is the 29th of May, and it is only meet and fit that the shadows overhead should come from the branches of the tender-leaved oak. Little Rosebud, flushed in the hedgerow out of the heat, sits crowned with flowers, clapping her hands at the large sportive Mayflies on the water. She thus receives her first lesson in entomology, and hears the story of the nautilus, which the insects are imitating. They fall on the water light as snow-flakes, spread out their wings like sails, and run free before the wind or gracefully tack, as it may please them. Little Rosebud claps her hands at the furious leaps of the trout, and shouts with very joy when the fly, after skimming daintily along the surface, and dallying with doom, takes wing once more, and escapes scot-free.

'But let us pass on. We will dwell no longer on this remembrance of a happy day; but should I live to the extremest span of human years, whenever the Mayfly appears in its season, the picture of little Rosebud in the shade, following the airy flights of the heedless insects, now up, now down, with her dancing eyes, will be ever before me, for little Rosebud, alas, needs no more to sit in the hedgerow out of the heat.

'The evening fishing repays me for the idle hour, and, to be honest, I meet with far more good fortune than I deserve. Above the mill, by the hatches, the placid current, when the day declines, is troubled with the movements of many trout. They appear to make no distinction between the insects that touch it. Drake or moth shares the same fate. My artificial Mayfly is quite as good as the plumpest reality. The ladies hover round, observing that fly-fishing is a most gentlemanly pastime, and that a trout is entitled to special consideration as one of the upper ten of the finny tribes. I strike an attitude, and resolve to treat my audience to something artistic. I dry the fly: one, two, three, and then for a cast that shall win a compliment and a fish. The great wings float trembling down to the verge of an eddy, and lo! a plunge and—Alack, the cast rebounds with no fly at its extremity. I have by sheer stupidity lost both my compliment and my fish; it is the usual result of trying for too much, and the pinch of the mishap is that it has reduced my stock of Mayflies to a solitary specimen, with yet another hour of daylight.

'That unfortunate trout will be telegraphing danger to all his relatives and acquaintances, unless he has darted into a quiet corner to persevere if haply he may rub the hook out of his jaws; in which operation I wish him speedy success.

'It is better after this blunder to shift quarters for a few minutes, and take care that the fault

does not recur. But how true it is that misfortunes do not come singly! Not five minutes elapse before a wild attempt at an impossible cast deprives me of my last Mayfly. I have left it driven hard into the overhanging bough of an alder that any tyro should have avoided. With varying success I now move up stream, picking out a trout here and a troutlet there with an orange palmer and a handsome blue dun. The still summer night steals on apace, and the half-hour remaining must be devoted to the broader part where the ladies witnessed my discomfiture. In point of numbers that half-hour turns out to be the most remunerative of the whole day; the trout rise freely at a tiny white moth, and are partial to a small coachman; twice I have a brace of young fish on the line at once.

'The lower part of the stream I am compelled to spare, and even then it is dark before I have arranged my spoil on a broad kitchen platter, artistically disposing the finest fish to catch the eye of the ladies chatting in the homely parlour of Brawl Mill. Supper being eaten, I plod up the creaking stairs, pondering that to tire the arms, stiffen the back, punish the right hand, develop the power of the lower limbs, and sharpen your appetite, you could pitch upon nothing better than a long day by the waterside in the Mayfly season.'

'The Thames'—a theme inexhaustible—has quite a new glow thrown upon it by Red Spinner; and even those who know every nook and corner of 'the glorious river,' will find, that if they have little to learn in respect to localities, they are presented with aspects both picturesque and poetical, which may not have struck them before. The bottom fisher will likewise glean some hints which are new and valuable.

We now get knee-deep into the meads, on, on across moors, to the Devonshire streams—playful cabinet pictures every one of them—similar in style to the charming one we have glanced at above—the discourse upon which makes us glance from our desk to the mantel over which our rods are arranged in spruce order, and in the centre of which hangs our cap festooned with flies. Such reading is indeed tantalising; but we are not denied the mental treat of hooking on our arm to Red Spinner, and jogging along with him over moss, heath, and boulder, down or up the Exe, the Teign, the Otter, the Sid, the Axe, and other Devon streams, all of which—their trout, and the delicate handling of the tackle it requires to make them your own—he dilates upon with the unctuousness of a keen observer and true piscator, pointing out the prosaically useful; as where to get a bed, buy the best and most appropriate tackle, and to whom to apply firstly—ever remember that, brother—for permission to fish the more exclusive waters.

Then the scene is changed, and our spirit—although still at the desk, and the disposition of the right hand to flourish the pen in a parabolic fly-line career almost unconquerable—is wafted to 'The Midlands.' The 'slow winding Ouse, that as with molten glass inlays the vale,' passes panoramically before us, and we again, in fancy, as we have before done in reality, follow its banks, with 'groves, heaths, and smoking villages remote,' from its rise to its fresh-water wedding with the salt. The Trent likewise claims ample, yet not too great a share of space, in a book which is

apparently prattling without being discursive—the especial characteristic of the best of modern angling literature.

*Waterside Sketches* is altogether an excellent specimen of blending the practical with the pleasurable, and its vivid and graphic sketches cannot fail to make it popular; for the author who delights us by his enthusiasm and manner of style will always be preferred to one whose object is only to instruct. It is not that the reader will get therein any deep insight into the mysteries of watercraft, but he will feel himself at once at home and welcome to an ample garniture of experience, handled with the decision and clearness of a master, without any crotchety detail or assumed superiority.

#### NOTES ABOUT THE MINT.

THE fifth Annual Report of Mr Fremantle, the Deputy Master of the Mint, which has just been issued, is rendered unusually interesting by the historical details which it supplies respecting the Records of the Mint, and the rise and progress of the medallic art. The Records have been carefully examined by a delegate of the Public Record Office, with a view to the ultimate removal to that department of those which may be deemed worthy of preservation. By a perusal of these books and papers, a number of interesting facts are learned respecting the gold and silver money of past times, and of the dies by which the pieces were struck. Among the more curious entries, is one specifying the 'Dies for the healing piece with the Angel,' and 'Dies for the healing piece with the Shipp;' the pieces here referred to being those wherewith the sovereign 'touched for the King's evil;' the practice of doing so having lasted till Queen Anne's reign.

A large portion of the Mint Records relate to the great coinage which took place between the years 1695 and 1700; and in an Appendix to the Report to which we are alluding, we find a few remarks about the country Mints, which were specially organised for that coinage. The new money required, we are told, being far in excess of what the Mint at the Tower was capable of coining with convenience to the public, Mints were established at Bristol, Chester, Exeter, Norwich, and York, each of which was apparently founded on the same model as that at the Tower, and had the same kind of officers and accounts. It was contemplated also to establish a similar Mint at Hereford; but if it ever was set up, no accounts are found of it. Old money and plate were received at a certain rate, and coin delivered out at the above five Mints in the same manner as in town; the Mint at the Tower, however, exercised a controlling power over the smaller establishments.

Mr Fremantle complains this year, even more emphatically than usual, of the machinery with which our Mint is expected to perform the highly important work intrusted to it, and he says that it is 'more obsolete and more inefficient than that of any Mint in Europe, not excepting that at Constantinople.' This seems somewhat strange; but evidently difficulties connected with the operations of the Mint are not confined to our own times. From a volume of correspondence relating to the period of which we are speaking, it appears that

the manner in which the business of the Chester Mint was conducted caused considerable anxiety to the principal officers in London. On the 21st June 1697, we learn, a letter was written by Mr (afterwards Sir Isaac) Newton, then Warden of the Mint, to his deputy at Chester, calling attention to information which had reached him 'importing a strong Suspicion of some fowle Play, either among the Tellers or in the Melting House, or both, whereby the Money comes out worse than heretofore.' These suspected malpractices were followed by long disputes between the Chester officials, which shew the petty anxieties to which Newton was subjected. This interesting volume concludes with an inventory of all the machinery required for a Mint at that period, and an account of the shipment to London of the plant of the Chester Mint in July 1698, when the work for which it was erected had been brought to a termination.

Another book, Mr Fremantle tells us, contains the accounts of the re-coining of a large quantity of old 'hammered' gold coin of the reigns of James I., Charles I., and Charles II., which had up to 1733 been current under the name of 'broad pieces.' These coins were received under proclamation at the Mint at the very high rate of L.4, 1s. per ounce, and the rudely fashioned 'hammered' money was thus finally withdrawn from circulation.

Of all the original Records remaining in the Mint, probably the most valuable is *A Booke of Entries of all the Assaies and Verdicts of y<sup>e</sup> Pix taken before y<sup>e</sup> Right Honble y<sup>e</sup> Lords of His Maties Privy Councill and others ab initio Regni Regis Jacobi I<sup>mi</sup> & deinceps*. The first entry in this book is on June 7, 1603, and on May 9 there appears one of 'The Assaies of y<sup>e</sup> Pix moneys taken in the Starr Chamber before the King's most Excell<sup>t</sup> Matie [James I.], Henry, Prince of Wales, &c.' Later on there is a record of a proclamation, dated November 9, 1657, and addressed by 'Oliver P.' to 'Our Rt trusty and Rt well beloved Nathaniel Fiennes and John Lisle, Lords Commissioners of our Great Seal of England,' giving directions that a trial of the pyx should be held in that year. The trial plates, prepared under the Commonwealth, were not recognised after the Restoration, but they are still preserved in the Mint almost intact. The last entry in this book refers to a trial of the pyx held on the 23d July 1760, a few months before the accession of George III.

Besides its ordinary functions in regard to the coin of the realm, the Mint has to produce all the medals required for the army and navy, and, in addition, since April 1, 1874, a new and very important duty has devolved upon the department—namely, the manufacture of all the bars and clasps for the same. This fact affords the Deputy Master an opportunity for giving an interesting sketch of 'the phases through which the medallic art has passed, in this and other countries, since the middle ages.' With this view, he presents his readers with 'autotypes of a few typical medals illustrative of this branch of art at different periods; and in order that the more ancient examples may not be altogether unrepresented,' he includes in the series 'a Syracusan coin representing Philistis, wife of Hieron the Second.' Most of the specimens given were photographed from

medals in the Coin and Medal Department of the British Museum.

According to Pinkerton's *Essay on Medals* (London, 1789), no medals appear in any country of Europe before the fifteenth century, with the solitary exception of the gold medals of David II., issued in Scotland between 1330 and 1370; in 1439, however, mention is made of a gold medal of the Council of Florence, and the art is known to have flourished continuously in Italy after that date. The medals of this period were modelled in wax, and cast in fine sand, and, in some cases, they were finished with the graving tool. The art flourished in Germany as well as in Italy, and the name of Albrecht Dürer is well known in connection with it. What are called the papal medals, commencing in the pontificate of Paul II. (1464), are considered the most beautiful series; many of them were designed by Raffaele, Giulio Romano, Francia, Cellini, and other famous artists. Mr Fremantle gives two examples of those by Francia and Cellini, which, he says, are as fine specimens of the art at that time as could be given. After the end of the fifteenth century, medals were *struck* instead of *cast*, and greater finish of workmanship was thereby attained. France came next in the matter of medals, but it was not till the reign of Louis XIV. that many works of good design and execution were produced. On the authority of the *Medallic History of England* (London, 1790), Mr Fremantle states that the oldest known English medal bears date 1480, and was the work of an Italian artist, but even in the time of Henry VIII. medals were still uncommon here. Several examples, however, are extant of medals struck in the reign of Queen Mary, and one of the best of them is that by Trezzo, of the queen herself. A very fine medal, which is unfortunately not extant, was struck in Elizabeth's reign to commemorate the defeat of the Spanish Armada; it bore the device of a fleet scattered by the winds, and the legend, 'Afflavit Dens et dissipati sunt.' Medals became numerous in the reign of Charles I.; and during that period, and afterwards under the Commonwealth, the works of Thomas Simon, the greatest of English medallists, form an important era in the history of English medals. A fine example of his work represents the head of Thomas Wriothesley, Earl of Southampton. After these, continues Mr Fremantle, no remarkable medals occur till the reign of Queen Anne, in which a series appeared commemorating the victories of Marlborough. In the succeeding reigns the style gradually tended towards a revival of Roman types, and this style has survived, with few exceptions, until within a comparatively recent period. As an instance, he mentions the Crimean war medal, the reverse of which represents Victory crowning a warrior equipped in Roman armour. Among the exceptions may be noticed the small head of Queen Caroline, most beautifully modelled by Pistrucci, chief medallist of the Mint from 1827 to 1851. Mr William Wyon, R.A., late engraver of the Mint, as is well known, produced many medals, some being of great merit. The medal awarded for 'distinguished conduct in the field,' 'long service and good conduct,' &c., which Pistrucci designed, well represents the degraded style of art which for a time prevailed, and which was followed, as in the case of the New Zealand and Abyssinian war medals, by designs of decorative

and geometrical ornament. In the 'Best Shot' (given annually to the army since 1870) and Ashantee medals, a successful attempt has been made to give good examples of contemporaneous English art, and with this view the designs for the reverse of both medals were intrusted to Mr E. J. Poynter, A.R.A., the dies being engraved by Mr Leonard Wyon, engraver of the Mint. In his *Dialogues upon the Usefulness of Ancient Medals*, Addison observes: 'We ought to look on medals as so many monuments consigned over to eternity, that may possibly last when all other memorials of the same age are worn out or lost;' and he pleads that medals shall represent, as accurately as may be, the dress and customs of the time of their issue. Evelyn contends also, in his *Discourse of Medals*, for accuracy in portraiture and types of race, as of great importance from an ethnological point of view, and he urges that medals should be truthful in these respects. 'In the design for the "Best Shot" medal,' remarks Mr Fremantle, in concluding his remarks on this subject, 'it was impossible, owing to differences of uniform, to adopt a dress common to the whole army, and it was necessary, therefore, to treat the subject allegorically; but in the case of the Ashantee medal, care has been taken, as will be seen, to represent the actual conditions under which the war was conducted, and the garb of the combatants on each side.' On the latter score, at any rate, the costume of the Ashantee warriors presented no difficulty whatever! This medal—of which some ten thousand are issued to the troops engaged in the war—is unusually elaborate in its design; the reverse represents one of the forest or jungle fights, so common in the campaign, and is beautifully executed; while on the obverse side is an effigy of Her Majesty, the work of Mr Leonard Wyon, who also engraved the dies for the medal.

### THE FAIRY FOLK.

AN old proverb warns us against the man who dislikes cats, music, or the voice of a child. I know not what obscure Solomon discovered this truth, but deep as was his wisdom, he forgot to complete his maxim, or surely he would have added to the list the man who dislikes fairy tales.

Gentle reader, do you know such a being? If you do, pray don't introduce him to me, for we would be sure to fight. I could not bear a man who shewed himself so utterly devoid of all natural feeling, of all perception of poetic and moral beauty, as to dislike—nay, as not to love—those beautiful legends, hallowed as they are by antiquity, and bringing with them a thousand associations to endear them to every heart.

So old are most of these stories, that they seem to have been part of the love of the world before man spoke with divers tongues, and was scattered over the face of the earth. Else how does it happen that the Russ in his wintry dwelling, or the Irish peasant by his fire of turf, tells to those around the same tale as that with which the Japanese mother quiets her unruly child, local colour alone being altered? The wonderful similarity of fairy tales all over the world is known to all who have studied the subject even very slightly, and cannot

possibly be explained on the ground of mere coincidence. The only possible solution of the question is that which I have mentioned above—namely, that these stories originated in a primitive state of society, and that, as man spread over the earth, so did they, growing with the growth of society; that being handed down from mouth to mouth, they underwent constant changes of form; and that in this manner the essence of the story remained unchanged, while the local colour ever varied with the circumstances surrounding the narrator.

The origin of the word 'fairy' is disputed. I have heard a very learned Persian—a university professor—state that the word is the same as the Persian *Peri* or *P'trie*, meaning 'winged one.' The words are perhaps connected; but it seems much more probable that the word *fairy* is Saxon in its origin, and that it is connected with the word *fair*. If this be so, the *y* is probably diminutive (as in *deary, baby*), and the word will signify 'pretty little thing.' I have never seen a fairy, and I don't think it probable that you have either, but still I am sure they are pretty little things. On the point as to whether they are winged, as the other derivation would imply, I know nothing, and the records which form the subject of this paper do not give certain information on the point.

No one who has merely read fairy tales as a child, and neglected them as 'rubbish' when grown to riper years, is likely to have considered their origin. If asked, he would probably reply: 'Ah—I suppose, ah—somebody wrote them,' and rest contented with such an answer. But, in this case, poor Topsy's unphilosophical surmise, 'Xpect I growed,' would be much nearer the truth. Fairy tales did grow, and, as no crop ever grew except from seed, the next question is, What did they grow from? In other words, why did these strange and beautiful tales of unreal beings, of lovely sylphs and wicked gnomes, spring up in the minds of men, and retain their hold through centuries—nay, through thousands of years—of mingled joy and sorrow, misery and triumph, savagery and civilisation?

The answer to this lies in the fact, that in the mind of man is implanted the faculty of imagination, and that the effect of this faculty is to make him, whenever he clearly perceives an effect whose cause is unknown, supply the cause himself. Hence, when he sees the storm-blast raging through a forest, tearing up the trees in its mad career, he pictures to himself a furious demon as sending and guiding the baleful wind; while the placid breezes, that fan cheeks heated by the sultry sun, are ruled by gentler spirits who love mankind. The oaks that spread their green branches to the sun, and the stream that dances to the sea, the tossing waves of ocean, and the boiling crater of the volcano, all live for him: and here is the first step towards our fairies.

In that grand old fairy tale (for a fairy tale it is), the *Iliad*, we find each river and other natural object invested with a distinct personality; not

merely the habitation or charge of a god, but a god itself. Achilles fought with 'the eddying Xanthus, the river whom immortal Zeus begot,' and we find the waves, &c. alluded to as portions of the personality of the god. In fact, in the first stage of fairy tale literature, all nature was regarded as itself animated, although under the control of the higher gods. But even these are by some considered mere impersonations of the sun, the air, and the other greater natural objects.

It here becomes necessary to digress, in order to remark, that in this early stage the fairy beliefs were identical with the religion of the country to which they belonged. In later stages, this connection grew less and less, until we find, that at first, men of education began to look upon these stories as mere fictions, and either to seek higher for their religion, or to become avowedly without any religious belief. Such was the case at Rome in Horace's time. At last these ideas spread to the vulgar, and then what had always been fairy tales in reality became fairy tales in name also. But I must return to the point from which I digressed.

In the second stage we find the personality separated from the natural object, and given to a being who either inhabits or is in some other way connected with the mountain, river, or tree, which was, in the former stage, regarded as itself possessed of life. This change may be philosophically accounted for by the growing perception of the impotence of matter, and the consequent tendency to refer whatever life it seemed to have to some external, and, in the strict sense of the word, supernatural being. To this class belong the nymphs—such as the Hamadryad or Tree-nymph—of classic mythology, dwelling as they did with and for the object to which they were attached, feeling the injuries inflicted on it, and dying with it. The belief in the existence of *local* spirits, and of spirits confined to particular elements—as the German division of elves into sylphs, undinës, gnomes, and salamanders—forms a sort of transition between the second and the third stage.

In the third stage, to which most of our fairy tales belong, the spirits have got separated from the associations and bounds of locality, and merely differ from men in degree as to moral character. Thus a good fairy is simply endued with all the qualities of a good human being, to the total exclusion of evil, while a bad fairy bears a great resemblance to a very wicked man. They, of course, differ greatly in physical power, but they may be generally described as well conversant with the laws of morality, but quite regardless of the laws of gravity.

By this time, the belief in these supernatural beings as objects of worship had for the most part disappeared, and what had been regarded as gods came to be exactly what we understand by the word 'fairies.' But, although no longer worshipped, they were still propitiated in various ways. Strange as it may seem, when considered in connection with the usual modes of propitiation with which fanatics approach their 'fetiches,' the most effectual mode of securing the good-will of the fairies has always been by personal neatness and tidiness in dwellings. In fact, it may be remarked, that although the religions of many countries are immoral in their tendencies, yet, as soon as these religions grow into the form of fairy

tales proper, they always convey good moral lessons, teaching in a plain and unambiguous manner the duty of succouring those in distress, of fidelity towards friends, of magnanimity towards enemies, and many other virtues more universally respected than practised. Thus, in the folk-lore of all countries, we are familiar with the old crone who is assisted by the hero of the tale, and who turns out a fairy, and assists him at the very moment when he is most in need of aid. In one form of the story the fairy rewards her benefactress with the gift of dropping flowers and precious stones from her lips whenever she speaks; and punishes her oppressor by causing her mouth to drop toads and vipers whenever she attempts to speak. Perhaps the reptiles were not a bit more loathsome than the language which would have been used by a lady whose character approached that of this damsel; and however doubtful we may feel as to the first-named gift being a blessing (especially at meal-times), I think that the story teaches in a beautiful way that gentle words are sweeter than roses, and kind speeches more precious than rubies.

While considering the moral lessons taught by fairy tales, it is worth mentioning that unconscious virtue is deemed worthy of reward, but that a deed good in itself, performed with a bad intention, is considered as in its nature evil. Both of these are moral points of the greatest delicacy, and of the highest importance. The first (taught in many fairy tales) is one of the chief lessons inculcated in our Saviour's parable of the Good Samaritan; while the second, when once properly put, will naturally commend itself to our moral sense. It is very well taught in the story of *Toads and Rubies*, mentioned above. This story is very old, and common to the folk-lore of many nations. The reader will doubtless remember that when the bad sister saw the manner in which the good sister was rewarded, she set out, determined to assist all old women who came in her way; that, however, the fairy did not come as she expected, but in the guise of a beautiful lady, and that all the bad sister's hopes of gain were consequently frustrated. Now, it may appear at first sight that this is not a good moral lesson, and that the girl should have been encouraged in her intention of shewing kindness to the poor old woman whom she had abused on the former day. But the teaching of the story is perfect, as will be at once seen when we consider that the girl now knew that the old woman was a fairy, and wished, not to atone for her harshness to a beggar, but to obtain the reward of benefiting a supernatural being; that she was prompted, not by benevolence, but by jealousy of her sister. Moreover, if she were at all altered for the better, she would not have refused to the lady the courtesy she was prepared to give to the beggar, and the punishment she suffered proves the perfection with which the design of the story is carried out. The moral is not, 'Be kind to poor women—fairies have sometimes appeared in that form;' but, 'Be kind to all; benefit all you can, be they rich or poor; and you shall have your reward.'

This fairy tale is not the only one that conveys lessons of sound morality. But it would take not one short paper, but several volumes, to analyse and examine the morality of one half of the fairy tales at present in existence. I will, however, venture to state that such an examination will

well repay the trouble, and that the morality of almost all will be found as perfect as that of *Toussaint* and *Rubies*.

In the third stage of which I have spoken, the development of the fairy tale proper was complete. Most of those which we have now, have of course received a more modern dress, and have, besides, been subjected to such influences as locality, the influence of prevailing thought, &c.; but the changes which have so arisen have chiefly affected the form, leaving the matter almost, or entirely, untouched.

It may be supposed that the spread of Christianity produced many changes in fairy literature; but, strange to say, remarkably few fairy tales have suffered any alteration under the influence of Christian teaching. A few, indeed, can be named which have taken a Christian form, but they might almost be counted on the fingers of one hand. Moreover, they do not mix the two forms, but take one *entirely* Christian; and in some of them, we have both forms in distinct existence. It would seem as if, at the beginning of the Christian era, these stories were already fixed in the minds of the people, and that, although smaller influences might affect them in minor details, their general character was too well marked to suffer any alteration. Such stories there are indeed afloat, as that which makes the fairies certain of the fallen angels whose sin was not considered so deep as that of those who are now the devils, and which represents them as placed on the earth to await a judgment of which they know not the result. But these run parallel to, rather than along with, the general course of the fairy legends, and seem to be attempts of the missionaries to awaken distrust where they could not shake belief; and most of the other accounts given of the origin of the wee folk are from their very nature shewn to be of much greater antiquity than this, comparatively speaking, modern invention. The well-known presumed antipathy felt by fairies to the mention of the name of the Almighty may be explained (without supposing any guilt on the part of the 'good people') in a subjective manner. The belief in fairies being, as I said above, a part of an old religion, what can be more natural than that men should avoid speaking of the new religion when they believed themselves in the presence of the representatives of the old one? A mere intuitive sense of anachronism would prevent the connection of the two names, and then (since it by no means follows that a man who has this sense will be able to explain it) the fear of the anger of the fairies would be brought in as an explanation.

In conclusion, I would wish to observe that, as the growth of mankind resembles the growth of the individual with regard to most matters, this is also the case with respect to fairy tales. In the period of the childhood of the world, men believed firmly in these strange and charming stories; then came a period in which men of education disregarded them, and found nothing in them, even as the youth finds nothing in the tales which delighted his childhood; and now, as the man begins to see new beauties in what he had loved as a child, and scorned as a youth, even so is the world beginning to read and understand those records of a past religion, those codes of old and sound morality, the tales of the fairy folk.

#### M O R N I N G.

O LIFE-RESTORING Morn, arise;  
Draw Sleep's soft curtain from our eyes:  
Let flow thy golden waves of light,  
And quench the darkness of the night;  
Disperse the vapours, dense and chill,  
That hang o'er woodland, vale, and hill;  
With sunbeams kiss the sleeping earth,  
And Nature wake to life and mirth.

Awake the song-birds in the wood;  
Unfold the daisy's purple bud;  
Bid flowers of varied hue display  
Their beauties to the opening day;  
Waft forth their fragrance on thy breath  
O'er spreading mead and thymy heath;  
Up from his covert rouse the deer;  
The wild-fowl by the fen and mere,  
Lure from their soft and downy nest;  
And life's vast tides, now laid to rest,  
Set flowing, bearing as they go  
Their freight of human weal and woe.

Lo! as thou com'st, glad sounds arise;  
Birds with their warblings fill the skies;  
The bees hum merrily as they sip  
Sweet draughts from Flora's honeyed lip;  
The folded sheep impatient bloat;  
Soft low the kine in pastures sweet;  
The ringdove in the leafy wood  
Coos softly to her new-fledged brood.  
The pent-up stream, with plashing sound,  
Falls as it turns the mill-wheel round;  
The lusty swain his cheerful song  
Sings as he drives his team along.  
From city, hamlet, hill, and glen,  
From all the busy haunts of men,  
Awakened Nature's voice is heard,  
To life again by thee restored.

Before thy hope-inspiring ray  
Night's troubled visions fade away:  
The feverish thoughts, the wild unrest,  
That fill the half-unconscious breast;  
Forebodings vague of coming ill,  
That fret the mind despite the will;  
The host of memories, fraught with pain,  
That haunt the chambers of the brain,  
Evanish 'fore thy radiant beams,  
Like phantoms seen in morbid dreams.

So, on the man of steadfast mind,  
To fortune, good or ill, resigned—  
Though troubles thickly round him rise  
As mist that on the landscape lies,  
If he but work, and hope, and wait,  
Undaunted by an adverse fate,  
With mien nor craven, nor defiant,  
On God and his own heart reliant,  
Strong in his conscious uprightness—  
Shall rise the dawn of full success:  
Misfortune's night shall pass away,  
And usher in a prosperous day.

## PRACTICAL HINTS FOR THE SICK-ROOM.

WHEN a woman thinks of making deliberate choice of the profession of a sick-nurse, she can of course take into careful consideration if her character and temperament are or are not suited for so arduous and trying an avocation. If she is a person of excitable nature, and possessed of but little self-control, she can be wisely counselled to give up the idea of a life for which she is so thoroughly unfit; but no peculiarities of character or temperament can exempt a woman from being called upon by the plain voice of duty, at one time or other of her life, to take her stand by the bedside of one dear to her, and soothe as best she may many a weary hour of restlessness and pain.

Very few, indeed, are the women who escape this rule—most have to take upon themselves the burden of attendance in a sick-room—and perhaps there are few subjects upon which the generality of women are so well intentioned, and yet so ignorant. With the very best and kindest meaning in the world, attention bestowed upon a suffering person may be productive of more discomfort than comfort to the patient, and endless annoyance to the physician, just because the zealous, but alas! untrained and undisciplined volunteer does everything the wrong way.

Again, from a mistaken and unreal idea of true delicacy and refinement, many women shrink from ever seeing or learning anything about suffering or sorrow; and so, when the inevitable fate brings the sights and sounds of pain, the dreadful realities of death, cruelly home to them, they are paralysed by terror, and useless, nay, worse than useless to those most dear to them. Even as I write, sad instances rise before my mind of a lack of moral courage, an utter impossibility of self-command, that has led the mother to flee from the bedside of her dying child, the wife to turn away from the failing sight that yearns to gaze upon her face while life yet lingers! The contemplation of pain could not be borne, because the mind was weakened and enervated by a selfish habit of yielding to the dislike of bravely facing anything disagreeable. Let all

true women train themselves to possess self-control, calmness, and patient courage; let them strive to acquire a certain amount of knowledge of the cares and duties of a sick-room; let them not shrink from hearing the details of this or that form of suffering and disease, and gladly and readily offer help (when they rightly and safely can) outside the bounds of their own immediate home circle. Let them rejoice in any fitting opportunity that may come in their way of perfecting themselves in this, the highest and holiest of a woman's duties, so that when their own time of trial comes they may not fail!

Taking it for granted that there are many who will gladly take a few plain and practical hints on this subject, I shall condense the result of a somewhat long and wide experience into a short space.

And first: It is in things which of themselves appear trifling, and even insignificant, that the comfort of a sick-room is made or marred. For instance, an energetic and amiably intentioned person places a cold pillow beneath the shoulders of a patient suffering from pneumonia, that is, inflammation of the lungs; a fit of coughing, perhaps a restless night, is the result. Five minutes' warming of the pillow at the fire would have prevented all this mischief, and even conduced to sleep.

Dress, again, is a matter of great importance in a sick-room, and here I must enter a protest against that very common practice of the amateur sick-nurse making a 'guy' of herself. I really have seen such startling and unpleasant costumes donned 'for the occasion,' as seemed to me enough to cause delirium in the patient, if long contemplated—shawls, and dressing-gowns, and wraps of such an obsolete and awful character, that the shadow of the watcher cast upon the wall by the dim light of the night-lamp, must form a horrible 'old granny,' and be, by no means a *pleasing reflection* to meet a sick man's eyes, as he wakes weak and confused from an opiate-won sleep!

The best dress for a sick-room is plain black—for the simple reason that no stain shews upon it—an old silk is the most economical, but silk

rustles, and is therefore objectionable. Black lustre is very serviceable—not made long enough to trail, upset chairs, and get under the doctor's feet; and not having hanging sleeves, but fitting close and neat at the wrist, so as to be finished off by nice white linen cuffs. (I have seen a hanging sleeve catch on some projecting point of chair or table, and convert a glass of egg-flip into a 'douche' externally applied, swamping the patient in a yellow sea, besides sending her into hysterics.) A habit of moving quietly about the room, and yet not treading 'on tip-toe' and making every board in the floor creak its loudest, is also very advisable; and nothing can be better by way of 'chaussure' than those soft, warm felt boots now so common; they both keep the nurse's feet from becoming cold, and make the least possible sound in moving about. Of course the manner of speaking in a sick-room is all-important. Oh, the horror of that dreadful 'pig's whisper,' which penetrates to the inmost recesses of the room, and wakes the sleeping patient as surely as the banging of a door!

I call to mind a case of fever—a very bad case, in which sleep was the one desideratum—almost the only hope. The sufferer had fallen into a doze—the terrible throbbing of the arteries in the bared throat seemed a little less rapid—the fire that was burning life away raged a little less fiercely—but, some idiot peeped in through a half-closed door, and with horrible contortions of the visage, intended to express extreme caution, whispered in blood-chilling tones: 'How—is—he—getting—on—now?'

In an instant, the patient had raised himself in bed, the poor hot hands were thrown out to ward off he knew not what—the filmy eyes stared wildly round—the parched tongue faltered: 'What is it? Where is it?' And for hours the weary head tossed from side to side, and meaningless words fell on the ears of those who watched and waited, and almost feared to hope. And yet it was meant in kindness!

In some of the most severe diseases, such as cholera and diphtheria, the patient is often *intensely* conscious of all that is passing around him. The wish to know everything that is said and done is extreme, and nothing excites a patient so much as anything like whispering and mystery. The natural voice, only so much lowered as to be perfectly distinct, is then the proper tone for a sick-room. If silence is needed, let it be complete, and no whispering permitted either in the room, or, worse still, outside the door.

And now I must say a few words on a disagreeable, but yet most important subject. In any case where operative surgery is necessary, it cannot be too strongly insisted upon, that no one shall remain present whose calmness and self-control are not a certainty. I remember well a delicate and difficult operation having to be performed—not a painful one, but where success mainly depended on the perfect stillness of the patient. Scarcely had the first slight incision been made, when the

room resounded with the moans and cries, not of the sufferer, but the friend who had kindly come to support her through the ordeal! With many a sob, and choke, and gurgle, the friend was assisted from the room, and then all went well enough; but great delay, and much increase of nervousness on the part of the patient, naturally resulted.

One of the many very eminent surgeons of whom America can boast, once told me that on the occasion of performing a most formidable operation, in which promptitude was a vital necessity, he saw, at a moment when seconds were precious, a friend who had insisted on remaining present, suddenly turn deadly pale, and fall fainting on the floor, in uncomfortably close proximity to the chloroformed patient. Dr B—— stooped down, and, *sans façon*, quietly rolled the insensible individual into a corner of the room, where he enjoyed undisturbed repose, until such time as some one had time to 'bring him to.'

Thus it may be seen that any one who is in the least nervous, and cannot be certain of their own powers of self-command, acts with truer kindness in remaining absent from such scenes, than by becoming an added source of anxiety, where there is so much already of the gravest character. If, however, a woman has the moral courage to face such trials calmly, and without flurry—if she can do simply what she is told, and *nothing more*—if she can hold her tongue—wholly dismiss herself from her own mind, concentrating all her attention on the patient, she may be of untold help and comfort. On the other hand, a sick-nurse who asks the doctor endless questions—who presumes in her ignorance to criticise his treatment—who is spasmodic in her sympathy, and ejaculatory in her lamentations, is pestilent in a sick-room, and she will, if possible, be got rid of at any cost.

But as well as the nervous and excitable nurse, there is another species of the genus against whom I would warn any one who in the least values his own comfort, and that is, the person who insists upon 'helping you' to nurse some very severe case, and never ceases assuring you that she 'keeps up splendidly at the time, but afterwards ——;' and then comes an ominous shake of the head, which is a ghastly intimation of what a time you will have of it with her, when what she is pleased to call the 'reaction' sets in. Nothing can be more aggravating than to contemplate such an individual, and look forward to the 'breaking-down' which she assures you is inevitable, and which you feel assured will come just when you and everybody else are tired out with nursing the real sufferer, and when you want to go to bed, and sleep your sleep out. The very idea of having to put hot-water bottles to her feet, and mustard poultices to her side, and cooling lotions to her aching brow, and watch her *se posant en martyr* (the while you are wishing her at Jericho, or some other equally hard-to-get-back-from place), is not a pleasant anticipation, as you sit opposite to her through a long night of

watching, and she tells you, with a melancholy yet vainglorious countenance, how she shall 'pay for this afterwards.' But she treats with scorn your suggestion that she should go to bed—indeed, she would be bitterly disappointed if she might not inmolate herself—and you. This sort of thing is what I call 'selfish unselfishness,' a kind of self-sacrifice that is always acting as its own bill-poster.

But there is one kind of nervousness which I do not think meets with sufficient consideration, and that is the unconquerable fear which you will find some people have of any disease that is infectious. Now, I think this sort of fear is far more constitutional than mental, and it appears to me most uncharitable to speak of those who are thus nervous by temperament as 'so frightened,' &c. Depend upon it, if any one has a great dread of infection, he is far better away from the chance of it. If I heard a person express a great and overpowering dread of small-pox, cholera, fever, or diphtheria, I should do all in my power to prevent that person going near any case of the kind, because I should be morally certain of the result. As a rule, I believe that those who are perfectly fearless are comparatively safe; and there is no truer test of perfect freedom from nervous dread than the fact of being able to sleep at once, quietly and naturally, and without the mind being obliged to dwell upon the work of the day. The best cholera nurse I ever saw used to tell me that she often sat down in the corner of a room, on the floor, and 'slept right off' for half an hour at a time, either day or night, just as such opportunity for rest presented itself. But of course there are exceptions to all rules; and one of the most devoted and the most fearless in attendance on the sick, during a terrible epidemic, died just when the worst of the battle seemed over.

But to return to some of those 'trifles,' the knowledge of which is so needful to those who would try to fulfil well the duties of an amateur sick-nurse.

When active personal care of a sick person is undertaken, the finger-nails should be kept very short. I have seen a long nail tear open a blister, and expose a raw surface, causing great pain. For the same reason, all removable rings should be taken off; and any ornaments that hang loose, and make a jingling noise, are best dispensed with, as they irritate and annoy a sensitive patient.

It seems to me that this very unpretending paper will be hardly complete without a few words as to the diet that is best for any one acting as sick-nurse in a long and trying case.

One great point is, to let no silly notions of sentiment prevent you making a practice of taking substantial and regular meals; and when you have to sit up all night, be sure and have food at hand, and never go more than three hours without eating. Now, I am going to say what I know many will highly disapprove of—and it is this: when you are nursing a long and anxious case, and you want to be able to 'stay' to the end,

*avoid all stimulants.* There is nothing you can do such hard work upon, there is nothing that will support you in long-continued watching and fatigue, like good, well-made coffee. Stimulants only give a temporary excitement, that passes itself off as strength. They injure that clearness of thought, that perfect quietude and recollectedness which are so essential to the good sick-nurse; and they tend more than anything else to that miserable 'breaking down afterwards' of which I have already spoken.

## THE FLAG OF DISTRESS.

### CHAPTER XV.—ON PLEASURE BENT.

THE clocks of San Francisco are striking the hour of ten. The moon has shot up over Monte Diablo, and sends her soft mellow beams across the waters of the Bay, imparting to their placid surface the sheen of silver. The forms of the ships anchored upon it are reflected as from a mirror; with masts upside down, every spar, stay, and brace, even to the most delicate rope of their rigging, having its duplicated representative in the fictitious counterfeit beneath. On none is there any canvas spread, and the unfurled flags do not display their fields, but hang motionless along masts, or droop dead down over taffrails. Stillness, almost complete, reigns throughout; scarce a sound proceeding either from the ships inshore, or those that ride at anchor in the offing; not even the rattle of a chain dropping or heaving an anchor, the chant of a night-watch at the windlass, or the song of some jovial tar entertaining his messmates as they sit squatted around the fore-castle stair. Unusual this silence at such an early hour, though easily accounted for. That there are but few noises from the ships in San Francisco Bay, is explained by the fact of their having but few men to make them—in many cases there being not a single soul aboard. All have deserted, either for good, and are gone off to the 'diggings,' or only for the night, to take part in the pleasures and dissipations of the town. Now and then a boat may be seen, putting off from, or returning to, the side of some of those better manned,—by its laborious movement, and the unmeasured stroke of oars, telling that even it lacks a full complement of crew.

Inside the town, everything is different. There, there are noises enough, with plenty of people, crowded streets, flashing lights, and a Babel-like confusion of voices. It is now the hour when iniquity has commenced its nightly career, or, rather, reached its full flush; since in San Francisco certain kinds of it are carried on openly and throughout all the hours of day. Business houses are closed; but these are in small proportion to the places of pleasure, which keep their doors and windows wide open, and where dissipation of all kinds reigns paramount. Into the gambling saloons go men laden with gold-dust, often coming out with their wallets lighter than when they went in, but their hearts a great deal heavier. After toiling for months up to their middle in the chill waters

of streams that course down from the eternal snows of the Sierra Nevada, working, washing—while so occupied, half-starving—they return to San Francisco to scatter in a single night—oft in one hour—the hoarded gatherings of half a year!

Into this pandemonium of a city are about to enter two personages of very different appearance from those usually seen loitering in its saloons or hastening through its streets; for they are the young officers belonging to the British frigate—Edward Crozier and William Cadwallader—returning to their ship. Not directly, as they were rowed ashore, but through the town; Crozier having ordered the boat to be brought to one of the rough wooden wharfs recently erected. They are advancing along the shore-road afoot, having declined their host's offer of horses; both saying they would prefer to walk; Cadwallader adding, in sailor phrase, that he wished to 'kick the knots out of his legs'—a remark but obscurely comprehensible to Don Gregorio. For some time after leaving his house not a word passes between them. Each is occupied with his own thoughts, the sacredness of which keeps him silent; absorbed in reflections, springing from that tender but painful parting with others, about what may be before them in the far uncertain future. For a time, nothing intrudes upon their reverie, to disturb its natural course. The sough of the tidal surf breaking upon the beach, the occasional cry of a straying sea-bird, or the more continuous and monotonous note of the chuck-will's widow, do not attract their attention. They are sounds in consonance with their reflections, still a little sad. As they draw nearer to the city, see its flashing lights, and hear its hum of voices, other and less doleful ideas come uppermost, leading to conversation. Crozier commences it:

'Well, Will, old fellow, we've made a day of it?'

'That we have—a rousing jolly day. I don't think I ever enjoyed one more in my life.'

'Only for its drawbacks.'

'You mean our affair with those fellows? Why, that was the best part of it—so far as fun. To see the one in the sky-blue wrap, after I'd dirked his horse, go off like a ship in a gale, with nobody at the helm! By Jove! it was equal to old Billy Button in the circus. And then the other, you bundled over in the road, as he got up looking like a dog just out of a dust-bin! Oh! 'twas delicious! The best shore-adventure I've had since joining the *Crusader*—something to talk about when we get aboard.'

'Ay, and something to do besides talking. We've got a little writing to do—at least I have, a bit of a letter to this swaggerer, Mr Francisco de Lara.'

'But, surely, you don't intend challenging him—after what's happened?'

'Surely I do. Though, to say the truth, I've no great stomach for it, seeing the sort he is. It's *infra dig.* having to fight one's inferior, though it

be with swords or pistols. It feels like getting into a row with roughs in some slum of a sea-port.'

'You're right there; and as to calling this fellow out, I'd do nothing of the kind, Ned. He's a bad lot; so is the other. Blackguards both, as their behaviour has shewn them, they don't deserve to be treated as gentlemen.'

'But we're in California, Will; where the code of the duel takes in such as they. I suppose even here thieves and cut-throats talk about protecting their honour, as they term it; ay, and often act up to their talk. I've been told of a duel that took place not long since between two professional gamblers, in which one of them was shot dead in his tracks. And only the other day a judge was called out by a man he had tried, and convicted, of some misdemeanour; who not only went, but actually killed the fellow who'd stood before him as a criminal! All that seems very absurd, but so it is. And if this scarlet-cloaked cavalier don't shew the white-feather, and back out, I'll either have to kill or cripple him; though like enough he may do one, or the other, for me.'

'But don't you think, Ned, you've had enough out of him?'

'In what way?'

'Why, in the way of *revanche*. For my part, I should decidedly say you had far the best of it. After your first encounter in the morning I thought differently, and would have so counselled you. Then the insult offered you was unpunished. The other has put a different face on the affair; and now that he's got more than he gave, I think you should rest satisfied, and let things stand as they are—if he do. Certainly, after that knock and tumble, it's his place to sing out.'

'There's something in what you say, Will. And now, on reflection, I'm not so sure that I'll take further trouble about the fellow, unless he insist on it; which he may not, seeing he's unquestionably base coin—as you say, a blackguard. He appears a sort of Californian bravo; and if we hadn't secured his pistols, I suppose he'd have done some shooting with them. Well, we'll see whether he comes to reclaim them. If he don't, I shall have to send them to him. Otherwise, he may have us up before one of these duelling justices on a charge of robbing him!'

'Ha, ha, ha! That would be a rare joke; an appropriate ending to our day's fun.'

'Quite the contrary. It might be serious, if it should reach the ears of Bracebridge. The old disciplinarian would never believe but that we'd been in the wrong—taken the fellow's pistols from him for a lark, or something of the sort. True, we could have the thing explained, both to the San Franciscan magistrate, and the frigate's captain; but not without an exposure of names and circumstances, that, though it might be appropriate enough, would be anything but a pleasant finale to our day's fun, as you call it.'

'Well, I know what will,' rejoins Cadwallader,

after listening patiently to his comrade's explanatory speech, 'and that's a glass of something good. Those sweet Spanish wines of Don Gregorio have made me thirsty as a fish. Besides, parting with my dear Iñez has got my heart down, and I need something to get it up again.'

'All right, my hearty!' exclaims Crozier; for the jest's sake, talking sailor-slang—'I'm with you in that way. For this day at least we've had enough of war; therefore, let's end it with another *w—wine*.'

'For my part,' responds the young Welshman, 'I'd prefer a different article, which has the other *w* for its initial letter—that's whisky. If we could only get a glass of good Scotch or Irish malt in this mushroom city, it would make a new man of me—which just now I need making. As I tell you, Ned, my heart's down—dead down to the heels of my boots. I can't say why, but there it is; and there, I suppose, it'll stay, unless Dutch courage comes to the rescue.'

'Well, you'll soon have an opportunity of getting that. As you see, we're in the suburbs of this grand city, partly constructed of canvas; where, though food may be scarce, and raiment scanty, there's liquor in abundance. In the *Parker House*, which is, I believe, its best hotel, we'll be sure of finding almost every beverage brewed upon the earth—among them your favourite whisky, and mine—"Bass's Bitter."

'Again the Spanish saw, "*Cada uno a su gusto*," as just now my sweetheart said. But let us step out.'

'Don't be in such hot haste. You forget we've something to do; which must be done first—before everything else.'

'What?'

'Look up Harry Blew—find him, if we can, and coax him to take service in this Chilean ship.'

'He won't require much coaxing, once you say the word. The old salt is anything but ungrateful. Indeed, his regard for you, ever since you saved him from that shark, is more like real gratitude than anything I ever saw. He fairly worships you, Ned. He told me the day before he left the *Crusader*, that parting with you was the only thing that greatly grieved him. I saw the tears trickling down his cheeks, as you shook hands with him over the side. Even then, if you'd said stay, I believe he'd have turned back into his old berth.'

'I didn't, because I wished him to do better. You know he'd have a splendid chance here in California—to get rich by gold-digging, which no doubt he might, like a great many other humble sailors as himself. But now, this other chance has turned up in his favour, which I should say is surer. Don Gregorio has told us he can get from the Chilean captain almost any pay he may please to ask; besides, a fair likelihood of being made his first-mate. That would suit Harry to a hair; besides, in my opinion,

answering his purpose far better than any gold-seeking speculation. Though a man of first rating aboard ship, he's a mere child when ashore; and would be no more able to protect himself against the land-sharks of San Francisco, than he was to get out of the way of that sea-skimmer at Guaymas. Even if he should succeed in growing rich up the rivers, I'd lay large odds, he'd be back here in port, and poor as ever, within a week. We must save him from that, if we can. His natural element is the ocean. He has spent the greater part of his life on it, and here's a fine opportunity for him to return to, and stay upon it; for life if he likes, with better prospects than he could even have had on board a man-o'-war. The question is, how we shall be able to find him in this rookery of a place. Did he say anything, when you saw him, about where he was sojourning?'

'By Jove! he just did. Now, I recall our conversation, I remember him telling me that he was staying at a sort of boarding-house, or restaurant, called the "*Sailor's Home*," though he made no mention of the street. But, if I mistake not, I know the place, and can steer pretty straight for it.'

'Straight or crooked, let's set head for it at once. We've plenty of time, if that were all, for I told the coxswain not to come for us till well after eleven. I want to see something of this queer Californian life, of which I haven't had much experience yet.'

'The same with myself.'

'Well, we may never again get such a chance. Indeed, it's not likely we shall, either of us, be allowed another night ashore, before the *Crusader* sails; therefore, let us make hay while the sun shines, or, to speak less figuratively, a little merriment by the light of the moon. We've been either savage or sentimental all the day, and stand in need of changing our tune.'

'You're right about that; but the music is not likely to be made by moonlight—not much of it. See those great clouds rolling up yonder! They'll be over the sky in ten minutes' time, making everything black as a pot of pitch.'

'No matter; for what we want, gas-light will serve as well; and there's plenty of that in San Francisco. Now, for Harry Blew. After him, whisky punches at the *Parker*.'

'And after that?'

'The tables, if you feel so inclined.'

'Surely, Ned, you don't want to go gambling?'

'I want to see life in San Francisco, as I've said; and, as you know, gambling's an important part of it. Yes; I don't mind making an attempt to draw the teeth of the tiger. *Allons!* or, as I should say in the softer language of Andalusia, *Nos vamos!*'

Thus jocosely terminating the conversation, the young officers continue on at increased speed, and are soon threading the streets of San Francisco in search of the *Sailor's Home*.

#### CHAPTER XVI.—A TAR OF THE OLDEN TYPE.

Harry Blew is a tar of the true man-o'-war type; this of the olden time, when sailors were sailors, and ships were of oak, not iron. Such ships are scarce now; but scarcer still the skilled men who handled their ropes, and kept everything taut and trim—in short, the true sailors.

Than Harry, a finer specimen of the foremast-man never reefed topsail, or took his glass of grog according to allowance. Of dark complexion naturally, exposure to sun, sea, and storm has deepened it, till his cheeks and throat are almost copper-coloured; of somewhat lighter tint on Sundays, after they have had their hebdomadal shave. His face is round, with features fairly regular, and of a cheerful cast; their cheerfulness heightened by the sparkle of bright gray eyes, and two rows of sound white teeth, frequently, if not continuously set in a smile. A thick shock of curling brown hair, with a well-greased ringlet drooping down over each eyebrow, supports a round-rimmed, blue-ribboned hat, set well aback on his head. His shaven chin is pointed and prominent, with a dimple below the lip; while the beardless jaws curve smoothly down to a well-shaped neck, symmetrically set upon broad shoulders, that give token of strength almost herculean. Notwithstanding an amplitude of shirt-collar which falls back full seven inches, touching the shoulder-tips, the throat and a portion of the expansive chest are habitually exposed to view; while on the sun-browned skin of the latter may be seen a tattooed anchor. By its side, not so plainly exposed, is the figure of a damsel done in dark-blue—no doubt a souvenir, if not the exact similitude, of a sweetheart—some Poll of past time, or perhaps far-off port. But there is a doubt whether Harry's heart has been true to her. Indeed, a suspicion of its having been false cannot fail to strike any one seeing him with his shirt sleeves rolled up; since upon the flat of his right fore-arm is the image of another damsel, done more recently, in lighter blue; while on the left is a Cupid holding an unbent bow, and hovering above a pair of hearts his arrow has just pierced, impaling them through and through. All those amorous emblems would seem to argue our true tar inconstant as the wind, with which he has so often to contend. But no; nothing of the kind. Those well acquainted with him and his history, can vouch for it that he has never had a sweetheart save one—she represented in that limning of light blue, and to her was he true as steel, up to the hour of her death, which occurred just as she was about to become Mrs Blew. And that sad event has kept him a bachelor up to the present hour of his life. The girl on his breast in dark blue is a merely mythical personage, though indelibly stained into his skin by a needle's point and a pinch of gunpowder, done by one of his man-o'-war shipmates while he was still only a sailor-lad. He is now forty years of age, nearly thirty of which he has passed upon the sea; being off it only in short spells, while his ship has been in port. And he has seen service on several ships—corvettes, frigates, double and treble deckers—all men-of-war, in which he has thrice circumnavigated the globe. For all, he is yet hale, hearty, and in the perfect plenitude of his strength; only with a slight stoop in the shoulders, as if caught from continually swarming up shrouds, or leaning over the yard while stowing sails. This gives him the appearance of being shorter than he really is: for when straightened up, with back well braced, he stands six feet in his stockings. And his limbs shew symmetrical proportion. His duck trousers, fitting tightly over the hips, display a pair of limbs supple and sinewy, with thighs that seem all muscle from skin to bone.

In spite of his sterling qualities as a seaman, and noble character as a man, Harry has never risen to any rank in the service. With him has it been literally true, 'Once a sailor, still a sailor;' and though long ago rated an A.B. of the first order, above this he has not ascended a single step. Were he to complain, which he rarely ever does, he would in all probability say that non-promotion has been due to independence of spirit, or, shaping it in his own phraseology, owing to his 'not having bootlicked the swabs above him.' And there is some truth in this, though another reason might be assigned by those disposed to speak slightly of him: that although liking salt-water, he has a decided antipathy to that which is fresh, unless when taken with an admixture of rum. Then he is too fond of it. It is his only fault; barring which, a better man than Harry Blew—and, when sober, a steadier—never trod the deck of a ship.

As already said, he has trod many, the latest being that of the *Crusader*; in which vessel he has spent five years of his life. His engagement terminating almost on the very day she dropped anchor before San Francisco, he has been set free; either to stay in the ship, by entering his name upon her books for a fresh period of service, or step out of her, and go cruising on his own account whithersoever he may wish. Taking into consideration the state of things in San Francisco just at this very time, it is not strange that he elected to leave the ship. It would be stranger if he had even hesitated about it; though this he had indeed done, for some days lingering, with mind only half made up. But the golden lure proved at length too temptingly attractive; and, yielding to it, he took a last leave of his old shipmates, was pulled ashore, and has since been sojourning at the Sailor's Home—for he is still there, as Cadwallader rightly surmised.

The Sailor's Home is a hostelry, half eating-house, half drinking-saloon, of somewhat unpretentious appearance—being a rough, weather-boarded house, without planing or paint, and only two stories in height. But if low in structure, it is high enough in its charges, as Harry Blew has learned; these being out of all proportion to the outside appearance of the place and its interior accommodation, though in keeping with the prices of all other like houses of entertainment in San Francisco. Harry's original intention was to make only a short stay at the Sailor's Home—just long enough to put him through a bit of a spree, for which twelve months' pay, received from the frigate's purser at leaving, had amply provided him. Then he would start for the Feather River, or some other tributary stream of the Sacramento. The first part of this programme has been already carried out, with something besides; that something being the complete expenditure of all his pay—every shilling he received from the purser, and in an incredibly short space of time. He has been scarcely six days ashore when he discovers his cash exchequer quite cleared out. As for credit, there is no such thing in San Francisco.

Since landing, Harry has not very carefully kept his dead reckoning, and is at first somewhat surprised to find himself so far out in it. He has plunged his hands into his pockets without encountering coin. He has searched in his sea-chest and every other receptacle where he has been

accustomed to carry cash, with similar disappointing result. What can have become of his twelve months' wage, drawn on the day he left the *Crusader*? It has all disappeared! No wonder he is unable to account for its disappearance; for ever since that day, he has been anything but himself—in short, he has given way to dissipation of longer continuance than ever before in his life. It has lasted six days, with most part of six nights, at the end of which time he has only pulled up for the want of cash to continue it—credit being declined him at the very counter over which he has passed all his pay.

Impecuniosity is an unpleasant predicament in any country, and at all times; but in the San Francisco of 1849 it was a positive danger—where six dollars were demanded and obtained for the most meagre of meals; the same for sleeping on a blanketless bed, in a chilly night, within a rough weather-boarded room, or under the yet thinner shelter of a canvas tent. It was a boon to be allowed to lie on the lee-side of a wooden-walled stable; but cost money for the privilege of sleeping in a stall, with straw litter for couch, and the heat of the horses in lieu of coverlet.

In the necessity of seeking some such indifferent accommodation, Harry Blew finds himself, on the seventh night after having received his discharge from the *Crusader*. And as he has now got somewhat sobered, with brain clear enough to think, it occurs to him that the time is come for carrying out the second part of his programme—that is, going on to the gold-diggings. But how to get off, and then? These are separate questions, to neither of which can he give a satisfactory answer. Passage to Sacramento, by steamer, costs over a hundred dollars, and still more by stage. He has not a shilling—not a red cent; and his sea-kit sold would not realise a sum sufficient to pay his fare, even if it (the kit) were free. But it is not. On the contrary, embargoed, quodded, by the keeper of the Sailor's Home, against a couple of days of unpaid board and lodging—with sundry imbibings across the counter, still scored on the slate.

The discharged man-o'-war's-man sees himself in a dread dilemma—all the more from its having a double horn. He can neither go to the gold-diggings, nor stay in the Sailor's Home. Comparatively cheap as may be this humble hostelry, it is yet dear enough to demand ten dollars a day for indifferent bed and board. This has been bad enough for Harry Blew, even though but a foremastman. But he is threatened with a still worse condition of things. Inappropriate the title bestowed on his house, for the owner of the 'Home' has not the slightest hospitality in his heart. He has discovered that his English guest is impecunious; this by the two days' board, and as many nights' bed, remaining unpaid. There is a notice conspicuously posted above the bar, that 'scores must be settled daily.' And Harry Blew having disregarded this, has received private but positive notice of another kind, to the effect, that he is forthwith to discontinue taking a seat at the *table-d'hôte*, as also to surrender up his share of the bed he has been occupying. At this, the discharged man-o'-war's-man has shown no anger, nor does he feel in any way affronted. He has that correct sense common to sailors, with most others who have seen travel in strange lands, and knows that when cash is not forthcoming, credit

cannot be expected. In California, as elsewhere, such is the universal and rigorous custom, to which man must resign himself. The English sailor is only a bit sorry to think he has expended his cash so freely; a little repentant at having done it so foolishly; and, on the whole, a good deal down-hearted.

But there is a silver lining to the cloud. The *Crusader* is still in port, and not expected to sail for some days. He may once more place his name upon the frigate's books, and rejoin her. He knows he will not only be received back by her commander, but welcomed by all his old officers and shipmates. A word spoken to the first boat coming ashore, and all will be well. Shall he speak such word? That has become the question. For in this, as every other step in life, there is a *pro* and *contra*. Humiliating the thought of going back to service on the ship, after taking leave of everybody aboard; returning to a dingy fore-castle, to toil, and the handling of tarry ropes, after the bright dreams he has been indulging in. To forego the gathering of gold-dust, and the exchanging it for doubloons or dollars; in short, turning his back upon fortune—the prospect of a life competence, perhaps plenitude of wealth, with its resulting ease and idleness—and once more facing stormy seas, with only hard knocks and laborious work in store for him throughout the rest of his life!

While the sovereigns were still clinking in his pockets, this was the dark side of the picture—towards Sacramento, the bright one. Now that the pockets are empty, everything seems changed, and the silver lining lies on the side of the ship. Still the sailor hesitates how to decide. Despite the pressure upon him, he ponders and reflects; as he does so, plunging his hands into his pockets, apparently searching for coin. It is merely mechanical, for he knows he has not a shilling.

While thus occupied, he is seated in the little sanded bar-room of the 'Home,' alone with the bar-keeper; the latter eyeing him with anything but a sympathetic air. For the book is before him, shewing that indebtedness for bed and board, to say nothing of the unsettled bar-score, and the record makes a bar-sinister between them. Another drink could not be added now, even though but a bottle of ginger-beer. The door of credit is closed, and only cash could procure an extension of a hospitality hitherto scant enough.

The sailor thinks. Must he surrender? Give up his dreams of fingering yellow gold, and return to handling black ropes? A glance at the grim, unrelaxed, and unrelenting visage of the bar-keeper decides him. His decision is expressed in characteristic speech, not addressed to the drink-dispenser, nor aloud, but in low, sad soliloquy:

'Wi' me, I see, the old sayin's to stan' good—  
"Once a sailor, still a sailor." Harry, you'll steer back for the *Crusader*!'

#### CHAPTER XVII.—UNEXPECTED VISITORS.

Having resolved upon returning to his ship—and that very night, if he can but get a boat—Harry Blew is about to sally forth into the street, when his egress is unexpectedly prevented. Not by the landlord of the Sailor's Home, nor his representative, who would be only too glad to get

rid of a guest with two days' reckoning in arrear. For they have surreptitiously inspected his sea-chest, and found it to contain a full suit of 'Sunday go-ashores,' with other effects, which they deem sufficient collateral security for the debt. And as it has been already hypothecated for this, both Boniface and bar-keeper would rather rejoice to see their sailor guest clear out of the Home for good, leaving the sea-chest behind him. On this condition they would be willing to wipe out the debt, both boarding and bar-score.

Harry has no thought of thus parting with his kit. Now that he has made up his mind to return to the *Crusader*, a better prospect is opened up to him. He has hopes, that on his making appearance aboard, and again entering his name on the frigate's books, the purser will advance him a sum sufficient to release the kit. Or, he can in all likelihood collect the money among his old messmates. Not for this reason only is he anxious to reach the ship that night, but because he has no other chance of having any place to sleep in, save the street. Both landlord and bar-keeper have notified him, in plain terms, that he must peremptorily leave; and he is about to act upon their notification, and take his departure, when prevented, as already said. What has hindered him from going out of the Home is a man coming into it; or rather two—since two shadows have suddenly darkened the door, and are projected across the sanded floor of the bar-room. Not like shadows in the eyes of Harry Blew, but streaks of brightest sunlight! For in the individuals entering he recognises two of his officers; one of them his best friend, and the preserver of his life. Crozier and Cadwallader have found him.

At sight of them the discharged sailor salutes promptly, and with as much respect, as if it were on the quarter-deck of the *Crusader*. But with much more demonstration; for their well-timed appearance draws from him an exclamation of joy. Jerking off his straw hat, and giving a twitch to one of his brow-locks, he bobs his head several times in succession, with a simultaneous back-scraps of his foot upon the floor.

His obeisance ended, he stands silently awaiting whatever communication the young officers have to make. He is already aware that their business is with himself; for the bar-room is but dimly lit, and Crozier, while crossing its threshold, not at once recognising him, called out the question: 'Is there a sailor staying here, by name Harry Blew?'

'Ay, ay, sir!' was the prompt response, the sailor himself giving it, along with the salutation described.

During the short interval of silence that succeeds, Harry's heart can be distinctly heard beating. Lately depressed—'Down in the dumps,' as he himself would word it—it is now up to his throat. The sight of his patron, the preserver of his life, is like having it saved a second time. Perhaps they have come to ask him to rejoin the ship? If so, 'tis the very thing he was thinking of. He will not anticipate, but waits for them to declare their errand.

'Well, Harry, old boy,' says Crozier, after warmly shaking the sailor's hand, 'I'm right glad to find you here. I was afraid you'd gone off to the diggings.'

'True, Master Ed'ard; I did intend standin' on that tack, but han't been able to get under way, for want o' a wind.'

'Want of a wind? I don't quite understand you.'

'Why, you see, sir; I've been a little bit spreesish since comin' ashore, and my locker's got low—more'n that, it's total cleared out. Though I suppose there's plenty o' gold in the diggin's, it takes gold to get there; and as I ha'n't any, I'm laid up here like an old hulk foul o' a mud-bank. That's just how it is, gentlemen.'

'In which case, perhaps you mightn't feel indisposed to go to sea again?'

'Just the thing I war thinkin' o', Master Ed'ard. I'd a most made up my mind to it, sir, an' war 'bout startin' to try get aboard the old *Crusader*, and askin' your honour to ha' my name entered on her books again. I'm willin' to join for a fresh term, if they'll take me.'

'They'd take and be glad to get you, Harry; you may be sure of that. Such a skilled sailor as you need never be without a ship, where there's a British man-of-war within hailing distance. But we don't want you to join the *Crusader*.'

'How is that, sir?'

'Because we can help you to something a little better. At least, it will be more to your advantage in a pecuniary sense. You wouldn't mind shipping in a merchant-vessel, with wages three or four times as much as you can get in a man-of-war? How would you like that, Harry?'

'I'd like it amazin'ly, sir. And for the matter o' being a merchanter, that's neither here nor there, so long's you recommend it. I'll go as cook, if you tell me to.'

'No, no, Harry, not that,' laughingly replies the young officer. 'That would never do. I should pity those who had to eat the dishes you'd dress for them. Besides, I should be sorry to see you stewing your strength away in front of a galley-fire. You must do better than that; and, it chanches, I'm authorised to offer you something better. It's a berth on board a trading-ship, and one with some special advantages. She's a Chilian vessel, and her captain is, I believe, either Chilian or Spanish. That won't make any difference to you?'

'Not a doit, sir. I don't care what the ship's colours be, nor what country her skipper, so long's he allows good wages an' plenty o' grub.'

'And plenty of grog too, Harry?'

'Ay, ay, sir. I confess to a weakness for that—leastways three times a day.'

'No doubt you'll get it, as often as you've a mind. But, Harry, I have a word to say about that. Besides my interest in your own welfare, I've another and more selfish one in this Chilian ship. So has Mr Cadwallader. We both want you to be on your best behaviour during the trip you're to take in her. On board will be two lady passengers, as far as Panama; for the ship is bound thither and for other ports beyond—I believe as far as Valparaiso. But the ladies are to land at Panama; and, so long as they're with you, you must do everything in your power to make things agreeable for them. If they should ever be in any danger—from storm, shipwreck, or otherwise—you'll stand by them?'

'Yes, Harry,' adds Cadwallader; 'you'll do that, won't you?'

'Lor, your honours!' replies the sailor, shewing surprise. 'Sure ye needn't a put sich questin to me—a British man-o'-war's-man? I'd do that much, anyhow, out o' sheer starn sense o' duty. But when it come to takin' care o' two ladies—to say nothin' about theer bein' so young, an' so beautiful'—

'Avast, Harry! How do you know they are either one or the other?' asks Crozier, surprised; Cadwallader repeating the question.

'Lor love ye, masters! Do ye think a common sailor ha'n't no eyes in his head, for anythin' but ropes an' tar? You forget I wur o' the boat's crew as rowed two sweet creeturs on board the *Crusader*, the night o' the grand dancin'; an' arterward took the same ashore, along wi' two young gentlemen, as went to see 'em home. Sure, sirs, actin' cox on that occasion, I couldn't help hearin' some o' the speeches as passed in the starn-sheets—tho' they wur spoke in the cars o' the saynoritas, soft as the breeze that fanned their fair cheeks, an' brought the colour out on 'em red as Ribsting pippins.'

'Avast again, you rascal! So you've been eavesdropping, have you? I quite forgot you understood Spanish.'

'Only a trifle, Master Ed'ard.'

'Too much for that occasion.'

'Ah! well, your honour, it may stand me in stead aboard the ship you speak o'.'

'Well, Harry, I'm not going to scold you, seeing that you couldn't help hearing what you did. And now, I may as well tell you that the young ladies you saw that night in the boat are the same who are to be passengers in the *Chilian* ship. You'll take good care of them, I know.'

'That, you may depend on, sir. Any one as touches hair o' their heads, to do 'em any injury, 'll have to tear the whole o' his off the head o' Harry Blew. I'll see 'em safe to Panama, or never shew there myself. I promise that; an' I think both your honours 'll take the word o' a British man-o'-war's-man.'

'That's enough. Now to give you the necessary directions about joining this ship. She's lying at anchor somewhere about in the Bay. But you'll find her easily enough. And you needn't go in search of her, till you've seen the gentleman whose name and address are upon this card. You see: "Don Tomas Silvestre," a ship-agent, whose office is down in one of the streets by the strand. Report yourself to him first thing in the morning. In all likelihood he'll engage you on sight, make out your papers, and give you full directions for getting aboard the ship. It appears she's short of hands; indeed, even without a single sailor. And, by the way, Harry, if you apply soon enough, it's good as certain you'll be made first-mate; all the more from your being able to speak Spanish. It's too late for you to do anything about it to-night; but don't oversleep yourself. Be at the ship-agent's to-morrow, betimes.'

'Ye can trust me for that, sir. I'll shew my figurehead there first thing in the mornin'; an' I an't afeerd o' no one gettin' aboard afore me, if they've not gone a'ready.'

'I think no one will be before you—I hope not. Send us word how you have succeeded, as the *Crusader* will likely be in port long enough for us to hear from you. Still, as she may sail on short notice, we may not see you again. Remember,

then, what we've said about the señoritas. We shall rely upon your fidelity.'

'Ay, well may ye, masters. You can both trust your lives to Harry Blew, an' those of them as is dear to you.'

'All right, old boy!' exclaims Crozier, satisfied. 'We must part; but let's hope we'll meet again. When you get back to England, you know where to find me. Now, good-bye! Give us a grip of your honest hand, and God bless you!'

Saying this, he grasps the horny hand of the sailor, and warmly presses it. The pressure is returned by a squeeze, that gives assurance of more than ordinary friendship. It is a grip of true gratitude; and the look which accompanies it tells of a devoted friendship, bordering on adoration.

Cadwallader also exchanges a like parting salutation; after which, the young officers start off, to continue their cruise through the streets.

### THE ZUIDER ZEE.

THE north and very low-lying coast of Holland has on several occasions been inundated in an extraordinary manner by invasions of the German Ocean; and indeed the history of this part of the Netherlands narrates a continuous effort to keep out the sea, and to reclaim land for serviceable purposes. Of the recovery of a large tract of land from an old inundation, the most notable instance is that of drying up the Haarlem lake or sea, by means of steam-pumps and an ingenious system of engineering, and which has been effected within the last twenty years. The Haarlem Sea was a bad case of destruction by water, but nothing to compare to that of the Zuider Zee, which began its dreadful work of intrusion in 1312, and continued to widen the sphere of its operations until 1476. A vast extent of country was submerged, by which flourishing towns and villages were destroyed, and the lives of hundreds of human beings were sacrificed. When the sea had done its worst, a productive district of country measuring about fifteen hundred square miles was covered with salt water, and became absolutely useless.

Even after an interval of four hundred years, the Zuider Zee does not look like a part of the regular ocean. It appears a limitless extent of dull brooding waters, with low marshy borders; so that in many places its shores are imperfectly distinguishable, while attempts to navigate its surface are often attended with extreme danger. Submarine shoals extend to the verge of the horizon, and banks of yellow sand covered by a foot deep of water communicate a peculiar colour to the sea. Add to this the green flat shore, varied only by a steeple or a windmill, and there arises in the mind an impression of deep repose. You have no occasion either to think or to act; you fall into the charm of a calm sweet reverie, and can understand how a race which has had such a landscape before its eyes for centuries, has laid aside its natural impetuosity for the phlegmatic character of the Dutch.

There are, however, few who have circum-navigated this sea; probably not ten persons in

Holland ; it is in truth one of the most difficult and dangerous passages. On an ordinary map, nothing looks more easy ; but there are banks of sand extending on all sides, and leaving a very narrow channel between them. If a mistake occurs in steering, or a blast of wind throws the vessel on to one of these banks, all is lost. Sad stories are told by sailors, and the wrecks lying about the coast shew plainly the perils of the voyage. A French writer, who is also an artist—M. H. Havard—undeterred by these difficulties, determined to visit the ruins of the old towns before decay had effaced the remembrance of former capitals, like Medemblik and Stavoren, and his *Voyage aux Villes Mortes du Zuiderzee* presents us with an interesting account of these out-of-the-world places.

His first object was to choose a suitable boat, drawing very little water, and yet sufficiently commodious to hold six persons, and to carry provisions for twenty-five days. With the exception of bread and a few fresh vegetables, no dependence can be placed on the resources of the country. Water even must be taken, for throughout the north of Holland it has a most objectionable salt flavour, and is injurious to those unaccustomed to its use. It was no easy task to find a captain, but at length one who had never been, but had all the desire, was found. 'With the help of God and a good wind,' said he, 'we shall prosper. I make two conditions: to be the judge of the weather, and not start when it is bad ; and not to work on Sunday.'

The crew was of very modest proportions, composed of the captain, his wife, a boy, and a sailor ; all were young and agile, and sufficed to handle the little craft. They lived a curious existence, rarely going on land, never sleeping there, but preferring to keep to the waters. The centre of the boat was divided into three compartments ; one for a dining-room, which was adorned with old tapestry, a carpet, four chairs, and a table ; silver and glass shone from some shelves, and by degrees M. Havard's sketches were hung, as taken, on the walls. The second served as a kitchen ; and in the third two hair mattresses were spread on boards, and made admirable beds ; the crew were lodged fore and aft. There are few spectacles more striking than the sea on a lovely summer's night, and on the Zuider Zee, nature seems to reach perfection of beauty. Our author is enthusiastic in his admiration, and assures us that such a sight can never be forgotten: the rippling waters reflected the stars in their pearly tints, while three or four lighthouses glowed on the scene with rosy tints. The captain promised us fine weather on the morrow, but he was mistaken ; on awaking, the boat was rocking violently, the wind blew furiously through the ropes, and the rain flooded the deck. 'It is well,' said he, 'that we got into port last night, or we should have been wrecked on the Lady's Sandbank ; the ropes have been broken like a bit of thread, and the flagstaff is in three pieces.' But with these little

variations the voyage was successful and pleasant ; and when the time for parting came, all were sorry to bid adieu, thanks to mutual concessions and similarity of feeling.

One of the prettiest as well as most curious of towns is that of Hoorn. Landing at the pier, which is commanded by a picturesque old tower, a worthy study for the artist, the traveller finds himself in a clear basin of water, bordered by masses of shrubs, large trees, and flowers. Over these peep the belfries and gables of the houses. All are old and striking, covered with carvings and bas-reliefs, the pointed roofs finishing with a spiral staircase, to give a view over the sea. Everywhere are wide porches and granite steps: sculptured wood and chiselled stone alternate with bright-coloured bricks, giving a character of gaiety and freshness, which contrasts singularly with their great age and old-world forms. It seems ridiculous to traverse such streets in modern costume ; the wide beaver hat and feather, military boots, and a rapier at the side, would be more in keeping. There are, alas, but few to frequent these deserted streets. Formerly, Hoorn covered the sea with its merchant vessels ; a thousand carts, bringing mountains of cheese weekly, appeared at its market ; whilst the yearly fair of cattle attracted multitudes of strangers from France, Germany, and the north.

The walls and deep ditch which defended the town still remain, some of the towers are standing, and the rampart is converted into a promenade, covered with trees and gardens. The two gates are magnificent in size and details. One named the Kooport, or Cowgate, testifies to the gratitude of the Dutch to the source of their riches ; it is surmounted by two cows lying down, as if contemplating their grazing sisters in the fields beyond ; four others also decorate the façade. Through another, called Westgate, there arrived, in 1573, a poor child worn out with fatigue and privation. On a hastily constructed sledge he had, with filial affection, laid his old sick mother, and fled before the Spaniards. Twice he had been arrested on the way, and twice, touched by his pious devotion, he had been permitted to proceed. The people of Hoorn perpetuated the remembrance of this heroic act in a bas-relief carved on the gate.

The weekly market is still held ; for, after Alkmaar, the largest cheese-trade is carried on here. Boer-wagen, covered with carvings and bright-coloured paint, drive in to the Waag, or weighing-house ; a pretty building of gray stone, with a graceful roof pierced by dormer windows. The cheeses are piled up, their yellow rind shining like gold ; and all round walk the calm, silent peasants, dressed in black. Then two will speak a few words, strike the hand several times, bending one or two fingers, and then striking them quickly out—private signals only known to themselves, and thus arrange the purchase. The price is only indicated by the pressure of the hand. When this is concluded, the porters of the Waag

come forward, dressed in white, with a blue, red, or green hat, according to the scales which belong to them; the cheese is then laid on a hand-cart, and officially weighed.

The trade of Holland is chiefly confined to agricultural products and fish. The wide pastures of the island of Texel feed two thousand horned cattle, a thousand horses, and thirty thousand sheep, which are celebrated throughout Europe. Every year twelve thousand of the last are exported, and the quarterly fair is very picturesque, when these flocks of sheep and lambs are shipped off to the continent. Through the basins of Harlingen, the port of Friesland, pass oxen and sheep, pigs and fowls, with mountains of cheese, fruits, and eggs for this country: here resort the provision-dealers of London, to carry away butter-barrels, which are piled up on the docks like cannon-balls in an arsenal. The canals are filled with the heavy-looking *tjalks*, or market-boats, which bring the good things of the country down to the port. Flax is a very important article of cultivation in Friesland; the market of Dokkum is one of the largest in Europe. The chief houses of England, Germany, and France have agents in this little town. The soil is incredibly rich; the peasants are well off; and there are few farmers who do not own some property in addition to the land they rent. It is rarely indeed that a tenant is turned out of his farm; families hold them for centuries, yet the lease is only for five or seven years, and stipulates how many head of cattle are to be fed on the meadows, and how much manure is to be laid on each acre; thus the soil is kept up to a wonderful state of fertility.

When De Ruyter tied to his mast the broom, as an indication that he had swept his enemies from the North Sea, and sailed up the Thames, his squadron had several vessels fitted out by the city of Hoorn. On one were two negroes, who had the boldness to carry away the figure-head from a ship lying in the river. The trophy was brought to Hoorn, and as a remembrance, an escutcheon was carved, and placed on a monument supported by two bronze negroes. Among the notabilities who were born here may be mentioned Abel Tasman, who discovered Tasmania and New Zealand; Jan Koon, who founded Batavia in 1619; and Shouten, who doubled Cape Horn, calling it after his native city.

The peasants of North Holland shew a great passion for colour; the red brick houses have yellow shutters and pale-green window-frames: not content with this, they paint nature itself; up to the lowest branches the trees are covered with white or blue; whilst the walks in the garden are straw-colour, with two red stripes at each side, which do not harmonise well with the closely cut hedges and gay flower-beds. In the village of Oppendoes many of the houses open into the stables, clean as any drawing-room, paved with tiles, and sanded with different colours, where the black and white cows stand on fresh litter, and the pails and buckets shine like gold and vermillion. Through this is the sitting-room, where handsome fresh-coloured girls, in the large cap and golden helmet-shaped head-dress, engage in charming fancy-work.

There are usually two doors to the house: one small one for daily use; the other sculptured, ornamented, and gilded, only to be opened for baptisms, marriages, and funerals. All these are the occasion of

interminable feasts. When the master of the house dies, he is dressed in black, with a white cotton night-cap on his head, and laid in his coffin, the face being uncovered. On the following day the family assemble; the widow, covered with a large black hood, sits at the foot of the corpse, and the religious service begins. When the preacher has ended, she bursts into a loud wail; the coffin is taken up, carried out of the ornamented door, and placed on a car, the widow seating herself on the coffin. Every peasant-woman cuts off her hair on her wedding-day, notwithstanding the remonstrances of her husband. Ornaments of all kinds are put on to cover up this act of vandalism; frontals of gold which are worth twenty or thirty pounds. The origin of this device is said to be, that the Dutch in former days loved the bottle too well, and the feast often terminated in violent quarrels, ending in a regular battle; and the women, wishing to save their heads from these conjugal attentions, adopted a metal helmet. This may be a doubtful interpretation; but it is certain that in many municipalities where conjugal scrimmaging was not unknown, it was the law to charge a husband who beat his wife with the payment of a ham, and two liams when the wife struck her husband.

Medemblik, the old capital of Western Friesland, would be a charming city if animation could be restored to it, but is now like a vast cemetery; a mortal sadness creeps over the solitary traveller as he passes over deserted quays, wide streets, and promenades. Long before Enkhuizen and Hoorn existed, it sheltered kings and their armies. Here resided the famous King Radbod, whom Pépin and Charles Martel did their best to convert to the Christian religion by armies and lances. He even consented to be baptised, but when his foot was in the baptistery, he hesitated, and asked the bishop if the kings his ancestors were in heaven or hell. The bishop replied that they were doubtless in the latter place, seeing that they had not been baptised; then said the king: 'I would rather go where my friends are, than follow the few that are in Paradise.'

One by one the old houses are dropping to pieces; the walls are rent, and the centre of the town is alone inhabited. Formerly, it had the privilege of a mint; fleets were armed; and around its magnificent docks splendid buildings still exist, but are deserted. Black and white cows graze peacefully on the green, which is surrounded by the grandest building in Holland for the construction of ships, now empty; and the former garden belonging to the admiral, once containing the finest collection of plants in Europe, is planted with potatoes.

Unfortunately, the people do not care to preserve their relics. The Stadhuis possessed a remarkable hall, but the wood-carvings have been taken down, and sold to an amateur. The castle, one of the oldest in Holland, where Radbod held his court, has been partially demolished. The remains are very interesting; here was placed the statue of the Friesland goddess Medea, to whom human sacrifices were offered. As it was gilt, and the sun shone upon it, the city received its name from this circumstance—*Medea blickt*, or shines.

Among the other old towns, that of Kampen possesses many antiquities. Of its seven gates, the four best are still standing. The Brothers' Gate,

in the midst of a lovely flower-garden, is one of the finest specimens of the architecture of the sixteenth century. It was named after the monastic order of the Brothers of Common Life, who did a good work in copying and preserving manuscripts. Gerard Groot was their founder, and they lived in absolute poverty, giving all they received to learned clerks who assisted them in their literary labours. There are some remarkably fine churches; but the gem of this old imperial city is the town-hall, which is a real feast to the eye of the artist. It has a façade of brick and stone, high roof pierced with dormer windows, and between every window are pinnacled niches filled with statues of the sixteenth century.

Within are two halls, just as they were when built: decorated with exquisite wood-carving and carved stalls, and seats fastened to the wall. Flags, pikes, halberds, partisans, witnesses to the struggles of old times, garnish the walls, and some formidable syringes of polished brass, shining like gold, which were used to throw boiling oil on assailants who approached too close to the walls. Nothing can give a better idea of a hall of justice in the sixteenth century than the second chamber, with its superb balustrade, stalls divided by Ionic columns, and the chimney-piece of four stages, unequalled in Europe for its fine statues and bas-reliefs.

Happily, the people have preserved their old municipal documents, instead of selling them for waste-paper; now they are priceless. A good library, pictures, and goldsmith's work, belonging to the ancient guilds, are interesting. There is a small gold box, called the bean box, containing twenty-four beans, six of silver-gilt, and eighteen of polished silver. When the members of the council were chosen for particular work, these beans were handed round; those who drew the gilt beans entered on their duties, the rest being rejected.

The island of Marken is entirely occupied by fishermen, and is extremely singular, for, owing to the perfectly level soil, and consequent inundations, the people have raised mounds of earth on which to build their seven villages. The houses are of wood, only one story in height, and painted green, blue, or black, with red-tile roofs; some are raised on poles, and look like immense cages suspended in the air. Of the thousand inhabitants, only women and children are to be met with on week-days—their intrepid husbands being far out on the Zuider Zee, fishing for plaice or herrings. Habituated from infancy to go through danger and fatigue, they are a fine race of men; content with the perfect equality which prevails over the whole island, and wishing for no luxuries, they become small capitalists. The houses are divided into as many rooms as the family requires, the bedroom being the largest and most adorned. The bed is a box in the wall, difficult to get into, and inclosed by curtains. The sheets and pillows are embroidered in open work, forming a kind of Guipure lace peculiar to Marken, and really elegant in design. The walls are covered with blue china, Japanese porcelain, and curiosities: a Friesland cuckoo clock; old brass chandeliers, shining like gold; and the oak cupboard, filled with large glasses and delft ware, complete the picture. Madame Klok, the confectioner of the island, has a splendid collection of china and pictures, as well as six beautifully carved cabinets, equal in style and preservation. These wonderful

relics of old Dutch art enjoy a real celebrity, so that the queen of Holland came last year to see them.

As the island is one huge meadow, the grass is made into hay. Twice a year, mowers come from the continent to cut it; they are called 'green Germans,' with their small helmet-shaped hats and large pipes. Their work ended, they depart, and the young girls turn the hay, and when dry, fill their light barques, then traverse the canals which cross the island in every direction to the port, where it is to be shipped. Nothing is more picturesque than these handsome women in their national costume of red, with large white head-dresses, working in the green fields, their fair hair—for they do not cut it off—fluttering in the breeze. On Sunday, all the boats are inshore; long, brilliantly coloured processions wend their way to church; after which all enjoy the weekly family gathering. Up to midnight, the houses are lighted up, and lanterns flit about; the boats are filling, lovers are parting, wives accompany their husbands, and soon the sea is covered with what resembles a cloud of glow-worms. Quietness settles down, for there is no trade; furniture, dress, beer, and even bread, all come from the mainland.

Though many of the churches were formerly fine examples of medieval architecture, the hand of the iconoclast has destroyed much of their beauty; they are now, as a rule, white-washed, and look cold and bare. That of Wester-Kirk has preserved its marvellous wood-carving in an old pulpit, which was once supported on columns of silver, now exchanged for bronze. The descendants of the Anabaptists or Mennonites still flourish at Harlingen; and though once so violent, are only noted for their mutual and rather exclusive Christian love, as forming one large family. In the church of the Old Catholics at Enkhuizen, the ancient sacerdotal vestments are preserved from the time when the archbishop of Utrecht, their first head, was excommunicated by the pope in 1725.

This is probably the only country where skating races are held. Young and old, rich and poor, enter the arena, which is a long straight canal, and nothing can give an idea of the dizzy rush of the competitors. The prize is always a piece of valuable plate, a trophy which is preserved in the family with great care, for to obtain it the owner must have striven with eighty or a hundred others. When the race is over, every one puts on his or her skates, and crowds cover the canal; here twenty, hand in hand, form a long chain; there an elegant little sledge is pushed by a brother or husband; or the grand carved sledge, gilded and painted with bright colours, is drawn by a fine horse, adorned with red rosettes and bells.

Whether it would be possible, with any practical advantage, to drain the Zuider Zee, and dyke out the ocean, we are unable to say. The Dutch are a most indefatigable and calculating people, and if the thing could be done, or were worth doing, they would do it; thereby adding largely to their available territory. The drainage of the Haarlem sea or lake has, we understand, succeeded commercially. The first time we visited it was in 1838, when we saw a stretch of twenty miles of water. On revisiting Haarlem in 1862, we saw a wide extended series of green fields dotted with farm-houses, and possessing all the indications of rural prosperity. The expulsion of the Zuider Zee

would, however, be a much more serious undertaking; but it would not surprise us to learn that steps at least were taken to greatly circumscribe its dimensions.

## THE TWO BACHELORS.

## IN TWO PARTS.—PART I.

It was in the summer of '61 that Jack Ferrars and myself, then gay bachelors of thirty, weary with the business that had surged in upon us during the winter months, rented between us a small shooting in the Western Highlands, with the view of recruiting our wasted energies in a pastime of which we were both very fond. I admired Ferrars almost passionately. He was a fine handsome fellow, with yellow hair and blond moustache, and possessed the gentlemanly manners and easy flow of conversation which I esteemed above all things. But my attachment to Jack was no mere passing admiration of his brilliant parts and fascinating manners; it dated as far back as the days when we were boys at school, and had gone on in an uninterrupted flow ever since, strengthened by the test of time. We had, moreover, numberless things in common, among the most important of which was—we were both confirmed bachelors; in good truth, bachelors proud of the name—bachelors who never intended to be anything but bachelors, and who took a peculiar pleasure in saying so, and in vowing allegiance to each other in a manner that would have done credit to the Corsican brothers.

It was therefore with brilliant anticipations of the delight we were to experience in each other's society, that we found ourselves the occupants of a pretty villa, on the outskirts of a little outlandish place in the Highlands, far removed from all friends and acquaintances. With a sigh of relief, and a delightful feeling of freedom, we wheeled our chairs into the open bow-window on the night of our arrival, and lighting a cigar, sat down to enjoy the really beautiful scene before us. In the foreground lay our own smoothly cut lawn and rectangular flower-beds, with the moonlight falling in pale bright bars over the sleeping flowers; and beyond, the silver loch, whence we could distinctly hear the light laugh of some late pleasure-seekers, as they rowed slowly homewards; while above the loch, the hills rose in dark majestic outline against the pale beauty of the sky. Jack, as apropos to the scene, had been repeating as best he could, between the whiffs of his cigar, Lord Byron's *Lake Leman*; and an animated discussion, which had afterwards arisen on the merits and demerits of that much maligned poet, was suddenly interrupted by a burst of the finest music I had ever heard. It was a splendid soprano voice, accompanied by the guitar, singing the old pathetic Scottish song *Auld Robin Gray*. The expression thrown into the voice was simply exquisite. When the mournful minor key was struck, Jack, snatched his cigar from his lips, leaned forward in a breathless listening attitude, as if afraid to lose a single vibration, and did not move again until the song had ceased. I felt strangely affected myself. I had often listened to the same song before, but never with the soul-thrilling of to-night. As the last cadence died

away, borne over the silvern water to the dark hills, it seemed to me as if it were an angel's whisper over the death-bed of a child.

The sounds proceeded from the open drawing-room windows of the villa next our own; and when at last they ceased, Jack, resuming his cigar in the most prosaic fashion, remarked: 'By Jove! that was good singing, Bob. This is better than a box at the opera; eh, old fellow?'

'It's the finest singing, without exception, I ever listened to,' I answered. 'I hope I won't meet the fair possessor of such an exquisite voice.'

'What an absurd fellow you are! Why?' asked Jack, blowing a long curl of smoke out of the window.

'Oh, because, if she's pretty, I feel as if I should fall in love with her.'

Jack winced at this betrayal of weakness. 'Pshaw! Harding, don't talk like an idiot. Ten to one she's an ugly old wretch, with sunken jaws, and powder enough on her face to last a Lord Chief-justice's wig for six months.'

'I almost hope she is,' I returned, 'for then my heart won't run such a chance of being captured.'

'You're a consummate fool, Harding,' was the flattering encomium of my friend Ferrars.

'Sorry you think so, Jack,' I said; 'but fool or no fool, if that's a pretty young girl, I wouldn't give sixpence for your own chances of retaining your bachelor notions much longer, Jack Ferrars.'

I leaned forward, smiling, to catch a glimpse of his expression in the dim light. A haughty curl was on his lip, and a look of scorn in his blue eyes, which disappeared with a ludicrous rapidity as soon as he observed I was rallying him.

'Ah! Bob, no fear of that,' he said; 'you and I are too jolly together to care about pretty girls, however fascinating—else we'd have been married long ago.'

'I begin to think so, Jack,' I returned; 'and, upon my word, I often wonder how a fellow like you, upon whom scores of designing mammas have had their envious eyes, was never caught.'

'I was just going to make the same remark about you,' said Jack, with a laugh, as he stroked his handsome moustache.

'It seems to me we're a couple of extremely clever fellows,' I answered, rising.

'We're a couple of extremely lucky fellows, at anyrate, to have safely escaped all the snares and fascinations laid for us,' returned Ferrars, shrugging his broad shoulders, and looking the personification of happy bachelorhood as he thus disburdened himself of his anti-matrimonial notions. 'But what say you to a bit of supper, old boy? it is getting late.'

I agreed, and we both descended to the dining-room. Mrs. Mason, the worthy housekeeper, had lit a fire in honour of our arrival, and the dying embers now cast a dark red glow on the walls, making a decidedly comfortable appearance, notwithstanding it was a fine autumn night. When we turned up the gas, a cosy little supper laid out for two was displayed, and the wine and fruit we had been using at dinner still stood on the side-board. Never were there two happier, jollier, or more amicable bachelors than Ferrars and I that night, as we sat chatting over our walnuts and claret, and laying out our schemes of enjoyment, until the small-hours warned us that it was high time we were in the primary enjoyment of sleep.

'Good-night, Jack,' I said, as at last we separated for our respective rooms.

'Good-morning, rather,' echoed Jack, as he shut his door; 'and I hope the ghost of Robin Gray won't disturb your slumbers.'

A sharp rat-tat on my bedroom door, and the familiar 'Hollo, old boy!' of Jack outside, awoke me from one of the most delightful and refreshing sleeps I had enjoyed for a long time. To say the least of it, I felt fierce to be thus awakened. 'Confound you, Ferrars,' I shouted; 'what do you want? Be off!'

'Get up, old boy, get up; if you're not out of bed before I count ten, you shall have no breakfast. One—two—three'—

The threat was too awful to be anticipated, and before he had completed the given number, I had unlocked the door for him. He came in with a merry look in his blue eyes, and throwing himself down on the bed I had so unwillingly vacated, began kicking the white counterpane with his dirty boots.

'Jack, man, look what you're doing,' I said, pointing to a mud-splatch on the clean linen. 'Mrs Mason will think I tumbled into bed last night in the disreputable condition of not knowing very well what I was about.'

'Just tell her I did it, Bob, and she'll be delighted to put on a fresh counterpane, I am sure. But do you know what I was doing this morning while you were driving your pigs to market?'

'Feeding the chickens, probably,' I answered, feeling cross at Jack's good-humour.

'Guess again,' he said, laughing.

'No; if you don't choose to tell me, my curiosity will wait,' I returned, as I arranged my necktie.

'Well, then, I've been getting on good terms with Mrs Mason, and finding out who our friends of musical repute next door are.'

'The dickens you have!' I ejaculated, pausing in the adjustment of my shirt-studs. Jack nodded, his blue eyes fairly dancing with merriment. 'And the result of your inquiries is'—

'That the household consists of a Colonel Hallam, his wife, and daughter.'

'Is that all you know about them?' I asked, somewhat disappointed at the meagreness of the details, as I put the finishing touches to my toilet.

'You ungrateful scoundrel!' returned Jack. 'Why, the people only arrived here two days ago, and Mrs Mason herself only got the information this morning from the baker's boy at the door.'

'Ah! then it's sure to be correct. But come, let's go down-stairs, and try if we can't get a look at Colonel Hallam or his pretty daughter.'

It was a glorious morning. The sunshine was dancing gleefully on the rippling surface of the loch, and the flowers were lifting their dewy heads, and filling the breakfast-room with their fresh fragrance. A very tempting repast stood awaiting us on the table, and Jack's blue eyes looked not amiss behind the coffee-urn.

'Altogether, this is very pleasant, Jack,' I remarked, as I took the cup he handed to me: 'you look almost pretty enough to kiss, my dear.'

'Come, no chaff. Is your coffee sweet enough?' he returned, affectionately twirling the ends of his blond moustache.

'Oh, it's there all right,' I said, alluding to the handsome appendage; 'I didn't make any mistake about that.' He turned his laughing eyes

on me for an instant, and no sooner had they wandered to the window again, than he started up uttering a long—'whew!' I stood up too, following his eyes inquiringly, and there, over the low hedge that divided the gardens, I caught sight of a young girl in a fresh morning dress, engaged in cutting flowers, and daintily arranging them into a bouquet. What we saw of her face under the broad-rimmed hat that shaded it was bright and beautiful.

'Good heavens! Miss Hallam,' said Jack.

'By Jove! Miss Hallam,' echoed I. And we both looked into each other's faces and laughed outright.

'What are you laughing at?' asked Jack, with the utmost inconsistency, as he sat down and resumed his breakfast.

'Just what you're laughing at,' I returned, breaking my egg.

'She's not old or ugly either,' he remarked after a pause.

'By Jove, she isn't!' I answered as I gulped a mouthful of my highly sugared coffee.

'Are you sorry?'

'No. Are you glad?'

'It doesn't matter a rap to me what she is, or is not.'

'You're a cynical old bachelor, Ferrars.'

'Allow me to return the compliment, Harding.'

'I rather meant you to keep it, I think.'

'I decline it with thanks, as not suitable. I'm not cynical.'

'When I wish to expatiate on the charms of a nice young lady, you get as sour as vinegar; now, you know it's true; so not a word in reply; but hurry up, old boy—*tempus fugit*;' and I pulled out my watch.

We were both in a hurry to be off to our sport, and soon all thoughts of Miss Hallam were forgotten in the bustle of arranging our shooting-gear. The wagonette was brought round to the door, and two very happy heart-whole bachelors sprang lightly into it, and were bowled away down the gravel-path, through the gate and out of sight. We had a pretty good day's sport on the moors, and returned home in the best of humour with ourselves, and tired enough to enjoy thoroughly an after-dinner lounge in our drawing-room, which we had converted *pro tem*. into a smoking-room, and ornamented in every available place with meerschaums, tobacco, and cigar-boxes.

Upon this evening, Jack, who was a fair player on the pianoforte, was performing the *Blue Bells of Scotland*, with much elaborate flourishing and crossing of hands, and I, as the audience, was stretched on three chairs at the window, lazily smoking my cigar in that sort of half-dreamy, comatose state that one feels in the enjoyment of well-earned leisure and rest. I cannot say that I was altogether in raptures over the *Blue Bells*, but perhaps they helped to promote the pleasant tenor of my thoughts as I lay with my eyes half-closed, letting the smoke from my weed curl affectionately in the folds of Mrs Mason's lace-curtains. 'How jolly Ferrars and I are together,' I chuckled to myself; 'this little trip of ours is going to be altogether a success. Girls are well enough to meet occasionally, but they become a bore. Now, suppose I had a wife with me here instead of Jack, she wouldn't be content unless she had the house filled with visitors and servants, and'—

Just at this interesting juncture of my ruminations, the flourishing and dashing at the piano stopped, and presently the chairs on which my legs were resting were pulled from under me, and I was left ignominiously sprawling on the carpet, with Jack's face grinning down at me in evident enjoyment of my discomfiture. But my fall did not cause me to forget the thread of my meditations, and as I gathered up my elegant limbs, I remarked: 'My wife would not have done *that*, Jack.'

'No; she would have kissed the poor tired darling, and thrown a shawl gently over him, to keep him from catching cold,' said Jack in a tone of mock-affection.

'Picture of domestic happiness!' I returned, laughing, as I readjusted the chairs. 'Hark! what is that?'

The stillness of the night outside was broken by the same exquisite music we had listened to on the previous evening. In an instant our banter was hushed. It was a gay lively air, which I recognised as a selection from the *Student's Frolic*, and the singer seemed even more at home in this style than in the pathetic. It made me feel as joyous as a bird in spring, and had I not been too lazy, I could have danced, in the very exuberance of my spirits.

'Jack, we must get an introduction to that little girl,' I cried enthusiastically, throwing my half-finished cigar out of the window.

But, to my surprise, Jack seemed in no mood to talk, and kept staring out of the window, taking no notice of my remark. Feeling aggrieved at not being met with the storm of opposition and contempt I expected for proposing such a thing, I went over and slightly shook him, at which he ran his fingers through his blond curls, and looking up with an expression of innocent surprise, asked: 'What is it?'

'Wouldn't you like an introduction to Miss Hallam?' I repeated.

'Why, yes; of course, Harding: you needn't have shaken a fellow half out of his senses to ask that silly question;' and Jack readjusted his broad shoulders and relapsed into silence again. I tried to talk of Miss Hallam, music, literature, politics, but all to no purpose; he sat staring out of the window, as if the seven wonders of the world were visible on our patch of moonlit lawn. Rather disgusted, I left him star-gazing, and retired to bed; but as I went up-stairs I must own to a little curiosity as to the cause that had made my amiable and talkative friend suddenly so laconic and disagreeable.

### MARSTON ROCK.

On the coast of Durham, about midway between the mouth of the Tyne and the town of Sunderland, stands, detached from the shore, a curious craggy mass, termed the Marston Rock. A huge instalment of the rock, through which the perpetual action of the waves has effected many passages, leaves here and there supports, which form lofty arches, and permit, at certain times of tide, the intrusion of visitors. A narrow flight of steps, assisted by a ladder, carried out over the sands at low-water, permits of the venturesome climbing to its summit, on which rabbits have been colonised, and breed, and often fall over its edge to

meet a certain death. In one of the chambers formed by the waves is a rude seat, called the 'Wishing-chair,' to which women resort, even from considerable distances, and there sit in the lap of Faith, as if they still lived in mediæval times. Another narrow and zigzag flight of some hundred steps on the cliff proper, opposite to this rock, carries us down to the shore. Here is the *Grotto Hotel*, a little inn, a couple of rooms in which we were fortunate in securing.

Let the reader picture to himself a house of fifteen rooms, all hewn, principally by the elements, out of the solid limestone. The first that we enter is common to all, and of an irregular shape. Its furniture is composed of odds and ends—old sea-chests and drawers, cabin stools of divers patterns and forms, all and each unquestionably of the flotsam and jetsam class. The stairs which lead from this apartment—part bar-parlour, part kitchen, and part bedroom—are of ship-timber, with the calking-holes open. This staircase (as well as those without, which ascend to a balcony) is railed with jolly-boat oars; but the great novelty of the interior is, that wherever the bare and exquisitely beautiful rock could be utilised, there it is left in its pristine state, whether for walls, floor, or ceiling. The interior staircase led to our sitting-room, one side of which was entirely of this limestone, and which we could only compare to a large unrolled and exquisitely coloured geological map. Nor was art wanting in our pretty suite of apartments, to which, if we pleased, we had uncontrolled access by a rustic staircase, without passing through the room before described. On the walls hung some well-executed water-colours, grateful souvenirs of artists that had come before us; an elegant piano in one corner; a sofa and easy state-cabin chairs spoke of the luxury of repose; and some well-chosen *tomcs*—the more acceptable from being in reference to the localities of Durham—formed a select library. Flowers adorned our windows, and between their glorious bunches of blossom we obtained a view of the smiling or angry ocean, as its humour in turns would take. Ours, however, was a week of peace, and so was that of the far-stretching sea. But this is indeed a most frightful coast in bad weather, and the raging ocean has occasionally taken possession of the lower rooms, put out the kitchen fires, and driven the inmates to seek shelter in the upper parts of the dwelling. The outer buildings of the grotto are constructed entirely of the *débris* of numerous wrecks, which testify by countless mementoes of these dire calamities. Wreck, wreck is everywhere—it pervades the chamber, the kitchen, and even the rifle-yard, in which were a store of floatabilities, each possibly with its history of some struggling wretch who had grasped it in the frenzied effort at rescue from a fearful death, and, mayhap after all, gone down in sight of my snug and cosy lodging. This conviction was the more and more obvious as I carried on my explorations in out-of-the-way recesses not usually entered by strangers, unless of a curious turn of mind. Even the dancing saloon—hewn out of the solid rock, and measuring seventy-five feet long and twenty-four feet broad—the flooring, and orchestra are portions of wrecks. Indeed, the door is cut out of a ship's rudder, and studded thickly with ships' nails, while the heavy iron ring of an anchor serves as a knocker. I could not ascend a step

without grasping portions of masts or clinging to a port-hole, while figure-heads met me at every turn. Here was a carved bust of 'Admiral Rodney,' there one of 'Mercury,' and others with lettered titles—'The Saucy Sally,' 'Constellation,' 'Four Brothers,' 'The Isis,' 'The Life Guard,' all serving to individualise and intensify this feeling; a sentiment which, for a mile or two in our slippery wanderings to the south, over labyrinths of fallen and weed-tangled rocks, received additional strength from the numerous fragments of wreck half-buried in sand, or tossed about in the spray of the broken waves. Yet amongst all this we were supremely happy, experiencing the utmost freedom both mentally and physically, according to our own notions; but perhaps some stray coastguard-man, had he watched our movements, as we, inspired by the pure ozone, scrambled with naked legs over apparently insurmountable barriers, to gain another and another point of view for our folio, or heard us shouting like a maniac, to drown the roar of the sea as it entered one of the many caverns, and rose through apertures far inland in white clouds, might in mercy have deemed it prudent that we should not have been left alone.

Of these caverns there are very many—indeed, they succeed each other sometimes in rapid succession, and are here and there connected; often having small channels, which tempted us to crawl on hands and knees to see where they led to. One of these, with a large irregular domed roof, has a perfectly cut circular hole in its loftiest portion, through which, by standing immediately underneath, we could detect daylight. We found that this hole opened on to the surface of the cliff, unrailed and unguarded, amidst and partly hidden by thick and stunted foliage. We must have passed it within a foot or so on our route!

A certain noted smuggler had arranged for a lugger to discharge its cargo here. As the time arrived at night that the vessel ought to be approaching the coast, and a signal shewn from the cave to indicate safety, a man long suspected of treachery was missing. The smuggler, therefore, to warn the skipper to keep away, set his dogs barking, and let off his gun, which brought the coastguard down (who turned out to be close by), but who were told by the smuggler that thieves had attempted to enter the hut. The skipper, taking the hint, had sheered off. The officers then made for Shields, and there found the vessel the next day, entered her, and seized some thirty casks of tobacco!—no, of bilge-water. The facts were that, upon receiving the signal, and knowing that the legal posse were collected elsewhere, the captain tacked about, and the cargo was landed in a lonely cove near Souter Point, where it was packed, after the fashion of beetroot, in an open field, which the officers passed for days after without the knowledge of the prize within their reach. A few mornings after, their attention was aroused by the sudden removal in the night of this heap, and then, and not until then, they recollected that its formation was equally mysterious. The story would not be complete without its touch of horror. For years after, moans were heard to proceed from this hole in the cliff, and no one would approach or pass it after night-fall. The cause assigned for these lamentations was, that the smuggler who attempted to betray the gang, being caught, was placed in a tub, and hauled up by a rope under the hole, and only let

down once a day, to receive some scant food and the gibes of his mates, his situation rendered yet more cruel from his position permitting him to witness his comrades feasting, and being made a target for the refuse of their festivities.

There are old men who still remember having seen as many as thirty pack-horses laden with spirits, and ridden or attended by as many armed smugglers, conveying whisky over the moors. One of the last efforts of smuggling on this coast is related by Murray, and shews that the excise officers are not always outwitted. A man died, and instead of his relatives ordering his 'kist' or coffin to be made by the neighbouring joiner in England, had his coffin made at Jedburgh, in Scotland, and instead of using the parish hearse, sent for a hearse from the same place. This came to the ears of the Border rider or revenue officer, who, struck by the peculiarity of the circumstances, mounted his famous black horse, ascertained the time of the funeral, and met the hearse just on the English side of the Border. He stopped the procession, and demanded in the king's name to examine the hearse. Hearse and coffin were both full of kegs of whisky. He immediately confiscated horses, hearse, coffin, and whisky; and, as he said, 'they went away mourners in good earnest.'

#### R E S T.

BENEATH the western heaven's span

Has sunk the golden day;

The clouds' rich sunset hues and tints

Have died in shade away;

The dim night comes from out the east

With gloom and vapour gray.

The stars far in the sky's blue depths

Their vigils 'gin to keep;

The moon above yon eastern hill

Climbs up the lofty steep;

The night-winds steal with gentle wing

Above the flowers asleep.

The birds upon the tuneless spray

Have folded close their wings;

And to the silent night alone

The winding river sings:

Its song is of the woods and meads,

A hundred happy things.

No voice is in the tranquil air,

No murmur save its own;

The earth is hushed as heaven above,

Where, girt with cloudy zone,

The moon goes up among the stars

To take her ebon throne.

Sweet calm, and undisturbed repose,

O'er all the landscape rest;

Yet is there in the breathless scene

A voice which thrills the breast,

A something, which in thanks and love

May only be expressed.

## VAGARIES OF THE BRAIN.

AN important question, with which most men at some time may be called upon to deal as jurors, has recently been illustrated by Dr Andrew Wynter, in a little volume as interesting as it is instructive.\* On nearly every circuit during the assizes, the responsibility of criminal lunatics proves a point of contention between law and physic, in deciding which the jury generally prefers the opinion of the doctor to the ruling of the judge. And it may be very safely affirmed, that, however legally unsound such verdicts may be, they do not point any dangerous moral, for few criminals choose to take advantage of a plea which would consign them to a madhouse. Men will be more ready too to endorse such decisions, after surveying those Borderlands of Insanity which our author has mapped out, after being taught how much of madness there is in the world, and how much of method there is in the madness.

Unsoundness of brain is often known only to its possessor. There is a stage of consciousness in which a person may be incessantly at war with himself, and with the promptings of a double, urging him to do and say things abhorred by his better self. 'I am not conscious of the decay,' wrote a patient to his adviser, 'or suspension of any of the powers of the mind. I am as well able as ever I was to attend to my business. My family suppose me in health, yet the horrors of a madhouse are staring me in the face. I am a martyr to a species of persecution from within which is becoming intolerable. I am urged to say the most shocking blasphemies, and obscene words are ever on my tongue. Thank God, I have been able to resist; but I often think I must yield at last, and then I shall be disgraced and ruined.' The famous Bishop Butler is said to have been engaged in such a conflict for the greater part of his life. Akin to this phase of unsoundness is the desire so commonly

felt to throw one's self from a height, or to give utterance at inappropriate times, as when Charles Lamb burst out laughing at a funeral. In such moments of temptation, the mastery of the reason over the inclination distinguishes the sane from the insane, and it is only the sustained eccentricity of thought and mode of life which points to a condition of the brain betokening insanity. Very noteworthy are some of the early symptoms of disorder. Of one of these, the undue exaltation of the senses, an instance is given, where the patient felt such an extraordinary acuteness of hearing, that he heard the least sound at the bottom of his house, and was able to tell the hour by his watch at a distance at which he could not ordinarily see the hands. Sometimes incipient disease is indicated by a perversion of the sense of touch, as in the case of a patient, who, from the fancy that everything he touched was greasy, was continually washing his hands. Other well-marked symptoms are the loss of memory, deterioration in handwriting, the use of wrong words in conversation, and double vision. Kleptomania, the habit of secretly purloining articles, is now a recognised form of brain disease. Indeed, so well known is it, that West End tradesmen, honoured by the custom of certain titled and wealthy kleptomaniacs, allow them to indulge in their peculiarities without any other notice but that of sending in to their friends an account for goods abstracted. Of another more terrible form of madness, dipsomania, it is curious to read that its victims will drink shoe-blackening, turpentine, and hair-wash, when they can get nothing else to satisfy the demon that possesses them. Sometimes these two forms of mania are seen co-existent in the same person under very odd circumstances. Thus it is recorded of one man, that when drunk he always stole Bibles; of another, spades; while a third individual invariably purloined a tub.

The examples of the insanity of the muscles, known as St Vitus's dance, are amusing as they are sad. One lady seemed to be imitating the action of a salmon at a salmon-leap. Doubling up her body, with a convulsive spring, she would bound on to the top of a wardrobe five feet high. Another

\* *The Borderlands of Insanity; and Other Allied Papers.* By Andrew Wynter, M.D. London: Robert Hardwicke.

case is that of a girl who was for ever trying to stand on her head, making fifteen such attempts in the minute for fifteen hours in the day, during a period of some months. The freaks which the disordered brain takes with memory are very remarkable. Sometimes certain numbers, or particular letters, or the terminations of words of which the initial letter is remembered, are wholly lost. In a case of yellow fever, the patient, a master of three languages, spoke with a different tongue at different stages of the attack; and instances are recorded of sufferers from brain lesion, after years of forgetfulness, taking up the recollection of an action at the very point at which it had left off. Thus, during the battle of the Nile, a captain was struck on the head whilst he was in the act of giving orders; after fifteen months' unconsciousness, he was successfully trepanned, when, rising up in bed, in a loud voice he finished giving the order which had been cut short by his wound. In another case, a New England farmer, after his day's employment in splitting timber, was in the habit of concealing his tools in the hollow of a certain tree. After a seizure which left his mind prostrated for years, he suddenly recovered, and went straight to the hollow tree in quest of the tools, of which the ironwork alone remained to record the lapse of time since they had been used. A curious example of the mind's double consciousness is to be found in the account of a young lady, who, after a profound sleep of unusual duration, awoke to find her mind a complete blank. Though she had been previously accomplished and well informed, it was necessary for her to begin to learn spelling and the rudiments of every old acquirement. After the lapse of a few months, another fit of somnolency restored her original powers, when she had no recollection of the second state of consciousness through which she had passed. Periodical transitions from one state to the other occurred for more than four years, being consequent always upon a sound sleep.

Delicate as the organisation of the brain must be, it is surprising to read of the hard knocks it can bear, not only without injury, but even to its advantage. One man who lost half his brain through suppuration of the skull, preserved his intellectual faculties to the day of his death; and the brains of soldiers have been known to carry bullets without apparent inconvenience, and to undergo operation for the extraction of the foreign bodies without loss of power. A physician, who was afflicted with an abnormal cerebral growth which pressed upon the cavities of the brain, so as to paralyse one side of his body, and render him speechless, retained possession of his reasoning and calculating powers until he died. One of three brothers, all idiots, after receiving a severe injury on the head, gained his senses, and lived to be a clever barrister. A stable-boy of dull capacity, and subject to fits, had his wits sharpened by the kick of a horse, which necessitated

the abstraction of a portion of his brain; and no less a personage than Pope Clement VI. owed the improvement of his memory to a slight concussion of the brain. On the other hand, it is a fact that the brains of persons with thoroughly disordered minds, as a rule present no abnormal appearance after death, which is not to be wondered at, Dr Wynter declares, when it is found that symptoms of a disordered brain are often produced by a very slight alteration in the constitution of the blood.

Our author devotes a chapter to the important consideration of the treatment of the insane. While men believed that madness meant possession by a demon, it is not difficult, perhaps, to account for the superstitious and brutal treatment shewn to those possessed; but the reader will be amazed by the details of the scientific devices, happily of a past age, planned for the cure of the unsound. One of these was to entice the sufferer to walk across a floor, which, suddenly giving way, dropped him into a bath, where he was half-drowned. Another mode of torture was to let the patients down a well, in which the water, made gradually to rise, frightened them with the prospect of an awful death. Within the memory of men still living, the patients of Bethlehem Hospital (Bedlam), chained to the wall like wild beasts, were shewn to the public on certain days of the week at the charge of twopence a visitor; and here were to be found in their cells, crouching on straw, women with nothing but a blanket for clothing. George III. in 1788 was subjected to a uselessly severe treatment, being constantly tortured with the strait-waistcoat, and denied the society of his wife and children. He recovered a few weeks after the substitution of kindness for severity. A parliamentary committee, which elicited the horrors of madhouses in 1815, struck the first blow against the system of mechanical restraint of the insane; but it was not before the early years of the present reign that the old order of things finally yielded to the benevolent treatment set on foot by Drs Gardner Hill and Conolly.

While Dr Wynter appreciates the improvements that have been effected in the care of lunatics, he is by no means satisfied with the existing state of things. The true principle of cure for the unsound being the association with healthy minds, the present system of palatial asylums, which condense and aggravate the malady, is eminently bad, and the confinement of at least thirty per cent. of the sufferers, who are harmless and quiet, unnecessarily cruel. As a model institution, our author points to the lunatic colony of Ghel, in Belgium, where the patients are dispersed among six hundred different dwellings, under the care of *nourriciers*, or attendants, in whose occupations they share, and with whom they live as belonging to the family. The entire colony is divided into districts for purposes of medical supervision, while its general government is vested in the hands of persons who dispense laws provided for it by a special code. The *nourriciers*, though badly paid—

that is, from sixty-five to eighty-five centimes daily—are chosen with a view to the individual requirements of their charges, and do not seem to be subjected to danger from such a strange companionship. The only system which in any way resembles that of the Belgian colony, is the Scotch plan of boarding out patients, who are distributed among their friends and in licensed houses, and is one which Dr Wynter thinks might be extended with great advantage throughout the kingdom. (A good example of the beneficial results accruing to this boarding-out system, is to be found at the town of North Berwick, a salubrious watering-place near Edinburgh. To a boarding-house, rented for the express purpose, are taken, in groups of half-a-dozen or so at a time, inmates of one of the establishments in the Scottish capital, who, after a week or two's sojourn, return home, invigorated and refreshed. It is almost needless to add that, during their holiday by the seaside, the most perfect order prevails; they walk out, sometimes attended, sometimes alone; and it has been observed by more than one, that nobody could tell there were 'daft folk' in the place.)

As a contrast to the by-gone treatment of the insane, it is a relief to turn to Earlswood Asylum, and share Dr Wynter's admiration of the training of imbecile children there carried out. The inmates of this establishment are specimens of what is termed arrested development; hence, we see young people of eighteen or twenty with the capacities of infants of three or four. The faculty of imitation is the great instrument of their instruction. Here we may see the 'finger-lesson,' during which a class of young women goes through a course of buttoning and unbuttoning. There we may listen to a group of children singing in chorus a nursery song, while imitating the action of bell-ringing, a course of procedure devised to teach them the use of their tongues. In a third room, we may see an excited crowd of lads playing at shop-keeping, carrying out the minutest particulars of real transactions, and higgling over a bargain with the most comical seriousness. In this asylum, different accommodation can be had by paying for it, as in an hotel, though this social distinction does not affect the system of training, which is similar for rich and poor.

Hallucinations and dreams are effects of a disturbed brain, of which our author gives some graphic illustrations. A famous portrait-painter who was in the habit of painting some three hundred portraits every year, was able to call up the features of his sitters so vividly, that he never required more than half-an-hour for his subject in the flesh, being able, after that short 'sitting,' to fill a vacant chair with the creature of his brain, and thence transfer it to canvas. This wonderful power eventually resulted in insanity. Another patient, who could place himself before his own eyes, and laugh and argue with his double, became at last so miserable that he shot himself. In the fourteenth and fifteenth cen-

tures, numbers of persons in France and Germany were possessed by a peculiar hallucination known as lycanthropy. Imagining that they had become wolves, they left their homes for the forests, and there leading the lives of wild beasts, became so ferocious as even to devour children. Three of these *were-wolves*, as they were called, on the confession of such horrors, were burnt alive at Besançon in 1521. Of dreaming, it is perhaps startling to be assured that it is so akin to insanity, as to be distinguished from it only by the absence of volition, while in the case of the somnambulist there is not even this point of difference. A story is given of a somnambulist monk, who, dreaming that the friar had killed his mother, went to his superior's bedside, and stabbed the clothes (happily unoccupied) through to the mattress.

Not the least interesting of Dr Wynter's chapters is that which treats of suicides, which, contrary to a prevalent notion, are wholly unconnected with fogs and depressing climates. Sometimes a person determined to destroy himself will wait months and years for an opportunity of executing the deed in the particular manner he has marked out for himself, and the very inclination to suicide may be removed by withdrawing the particular objects that would awaken the idea. Thus a man who has tried to drown himself will be under no temptation to cut his throat. Example, it is well known, is a powerful cause of incitement to the suicidal act. We were once told by a physician that a hypochondriacal patient used to visit him invariably the day after reading the report of a suicide in the daily papers, possessed by a morbid fear of imitating the act of which he read. Sir Charles Bell, surgeon of Middlesex Hospital, was one day describing to a barber who was shaving him, a patient's unsuccessful attempt to cut his own throat; and, on the barber's request, pointed out the anatomy of the neck, shewing how easily the act might have been accomplished. Before the shaving operation was completed, the barber had left the shop, and cut his throat according to Sir Charles Bell's exact instructions. Sometimes there is an epidemic of suicides, as at Versailles, in 1793, when out of a small population thirteen hundred persons destroyed themselves in one year; or as in the Hôtel des Invalides in Paris, when six of the inmates hanged themselves on a certain cross-bar within a fortnight. Very often this disease is hereditary, and at a certain age the members of one family will all in turns evince the suicidal tendency, while even children of very tender years have been known to end their short lives by their own act, from force of example.

Curious, too, are the methods of self-destruction, but they are too painful to bear description. A Frenchman once attempted to ring his own death-knell, by tying himself to the clapper of the church bell, which thereupon began to swing, and alarmed the villagers by its unwonted tones. All cases of determined suicide are characteristic of confirmed insanity; whereas, in cases of impulsive

insanity, the perpetrator will often regret the act before it is completed, and endeavour to save his life, as did Sir Samuel Romilly, thus demonstrating that the very attempt may effect the cure of the disordered brain. The months of March, June, and July are the favourites with men; September, November, and January for women, in which they voluntarily end their lives. In youth, men hang themselves; in the prime of life, use firearms; and when old, revert to hanging. Women usually prefer Ophelia's 'muddy death.' Poisoning is a method adopted by the very young of both sexes. We will end our notice of a most readable little book, by the consoling reflection that, prevalent as brain disorder is in our country, at least eighty per cent. of cases of insanity are curable, if treated at an early stage; whilst it is to be noted that it is not pleasurable productive brain-work that does the mischief, but rather the mental strain which results from the high pressure of our artificial life.

## THE FLAG OF DISTRESS.

### CHAPTER XVIII.—AN INHOSPITABLE HOME.

HARRY BLEW stands in the doorway of the Sailor's Home, watching the two gentlemen as they walk away, his eyes glowing with gratitude and sparkling with joy. And no wonder, considering the change in his situation brought about by their influence. Ten minutes before, his spirits were at their lowest and darkest. But the prospect of treble, or quadruple pay on board a snug ship, though it be a trading-vessel, with the additional chance of being mate instead of foremastman, has given them a fillip, not only returning them to their ordinary condition, but raising them to their highest and brightest. The only damper is regret at parting with the fine young fellow who has done so much for him. But he has passed through that already, when separating from his ship, and can now better bear it under the reflection that, though apart from his patron, he will have an opportunity of doing something to shew his gratitude. He knows how much Crozier is interested in the well-being of Carmen Montijo—for Harry has been made acquainted with her name, as also that of Iñez Alvarez—and to be intrusted with a sort of guardianship over the young girls is a proud thought to the ex-man-o'-war's-man.

To carry out the confidence reposed in him will be a labour of love; and he vows in his heart it shall be done, if need be, at the risk of life. Indeed, the interview just ended has made a new man of him in more senses than one; for upon the spot he registers a mental resolve to give up dram-drinking for life, or at all events till he has seen his charge—the two señoritas—safe landed at Panama, and the Chilean ship snug in the harbour of Valparaiso. After that, he is less sure that he may not again go upon a big spree.

Heaving a sigh as the young officers pass out of sight, he turns back into the bar-room. It is no

longer a question of his going aboard the *Crusader*. He must remain ashore, to be up betimes in the morning, so that he may be early at the office of the ship-agent. And now, again, a shadow, though only a slight one, comes over his spirit. He has still before him the undetermined question, where he is to sleep. Notwithstanding his fine prospects for the future, the present is yet unchanged. Unfortunately, he did not think of this while the young officers were with him, else a word would have made all well. Either of them, he doubted not, would have relieved his necessities had they been but told of them. Too late now; they are gone out of sight, out of hail, and whither he cannot tell or guess. To attempt searching for them in such crowded streets would be only a waste of time. While thus ruefully reflecting, he is confronted by the bar-keeper, whose countenance is now beset with smiles. The fellow has got it into his head that his sailor-guest is no longer impecunious. The navy gentlemen just gone have no doubt been to engage him for their ship, and perhaps made him an advance of wages.

'Well, my salt,' says he, in a tone of jocular familiarity, 'I guess you've got the shiners now, an' kin settle up your score?'

'No, indeed, sir,' answers Harry, more than ever taken aback; 'I'm sorry to say I hain't.'

'And what hev them gold-buttoned fellers been palaverin' ye about?'

'Not about money, master. Them's two o' the officers belongin' to my old ship—the British frigate *Crusader*. An' fine young fellows they be too.'

'Much good their finikin fineness seem to hev done you! So they hain't gin you nuthin' better than their talk, hev they. Nuthin' besides?'

'Nothing besides,' rejoins Blew, restraining his temper, a little touched by the bar-keeper's inquisitiveness, as also his impertinent manner.

'Nathin' but fine words, eh? Well, thar's plenty o' them 'bout hyar, but they won't butter no parsnips; and let me tell you, my man, they won't pay your board bill.'

'I know that,' returns the sailor, still keeping his temper. 'But I hope to have money soon.'

'Oh! that's been your story for the last two days; but it won't bamboozle me any longer. You get no more credit here.'

'Can't I have supper, and bed for another night?'

'No; that you can't.'

'I'll pay for them first thing in the mornin'.'

'You'll pay for 'em this night—now, if you calc'late to get 'em. An' if you've no cash, 'tain't any use talkin'. What d'ye think we keep a tavern for? 'Twould soon be to let—bar, beds, and all—if we'd only such customers as you. So, the sooner you walk off, the better the landlord'll like it. He's jest gin me orders to tell ye clear out.'

'It's gallows hard, master,' says Harry, heaving a sigh; 'the more so, as I've got the promise of a good berth 'board a ship that's down in the harbour. The gentlemen you seed have just been to tell me about it.'

'Then why didn't they give you the money to clear your kit?'

'They'd have done that—no doubt of it—if I'd only thought o' askin' them. I forgot all about it.'

'Ah, that's all very fine—a likely tale; but I don't believe a word of it. If they cared to have you in their ship, they'd have given you the where-withal to get there. But, come! it's no use shilly-shallyin' any longer. The landlord won't like it. He's given his orders sharp: Pay, or go.'

'Well, I suppose I must go.'

'You must; an', as I've already said, the sooner you're off the better.'

After delivering this stern ultimatum, the bar-keeper jauntily returns behind his bar, to look more blandly on two guests who have presented themselves at it, called for 'refreshments,' and tossed down a couple of dollars to pay for them.

Harry Blew turns towards the door; and, without saying another word, steps out into the street. Once there, he does not stop, or stand hesitating. The hospitality of the so-called 'home' has proved a sorry sham; and, indignant at the shabby treatment received, he is but too glad to get away from the place. All his life used to snug quarters in a fine ship's fore-castle, with everything found for him, he has never before experienced the pang of having no place to sleep. He not only feels it now, in all its unpleasantness, but fancies the passers-by can perceive his humiliation. Haunted by this fancy—urged on by it—he hurries his steps; nor stays them till out of sight of the Sailor's Home, out of the street in which the inhospitable tavern stands. He even dislikes the idea of having to go back for his chest; which, however, he must sometime do.

Meanwhile, what is to become of him for the remainder of that night? Where is he to obtain supper, and a bed? About the latter he cares the least; but having had no dinner, he is hungry—half-famished—and could eat a pound or two of the saltiest and toughest junk ever drawn out of a ship's cask. In this unhappy mood he strays on along the street. There is no lack of food before his eyes, almost within touching of his hand; but only to tantalise, and still further whet the edge of his appetite. Eating-houses are open all around him; and under their blazing gas-jets he can see steaming dishes, and savoury joints, in the act of being set upon tables surrounded by guests seeming hungry as himself, but otherwise better off. He, too, might enter, without fear of being challenged as an intruder; for among the men inside are many in coarse garb, some of them not so respectably appraised as himself. But what would be the use of his entering a restaurant without even a penny in his pockets? He could only gaze at dishes he may not eat, and dare not call for. He remembers his late discomfiture too keenly to risk having it repeated. Thus reflecting, he turns his back upon the tables so temptingly spread, and keeps on along the street. Still the double question recurs: where is he to get supper, and where sleep? Now, as ever, is he out of sorts with himself for not having given his confidence to the young gentlemen, and told them of the 'fix' he was in. Either would have relieved him on the instant, without a word. But it was too late now for regrets. By this time, in all likelihood, they have started back to their ship. How he wished himself aboard the *Crusader*! How happy he would feel in her fore-castle, among his old shipmates! It cannot be; and therefore it

is idle to think of it. What on earth is he to do? A thought strikes him. He thinks of the ship-agent whose card Crozier left with him, and which he has thrust into his coat-pocket. He draws it out, and holds it up to a street-lamp, to make himself acquainted with the ship-agent's address. The name he remembers, and needs not that. Though but a common sailor, Harry is not altogether illiterate. The sea-port town where he first saw the light had a public school for the poorer people, in which he was taught to read and write. By the former of these elementary branches—supplemented by a smattering of Spanish, picked up in South American ports—he is enabled to decipher the writing upon the card—for it is in writing—and so gets the correct address, both the street and number. Having returned it to his pocket, he buttons up his dreadnought; and taking a fresh hitch at his duck trousers, starts off again—this time with fixed intent: to find the office of Don Tomas Silvestre.

#### CHAPTER XIX.—THE 'BANK' EL DORADO.

A *Monté* bank in the city of San Francisco, in the establishment cyleped 'El Dorado,' part drinking-house, the other part devoted to gambling on the grandest scale. The two are carried on simultaneously, and in the same room—an oblong saloon—big enough for both. The portion of it devoted to Bacchus is at one end—that farthest from the entrance-door—where the shrine of the jolly god is represented by a liquor-bar extending from side to side, and backed by an array of shining bottles, glittering glasses, and sparkling decanters; his worship administered by half-a-dozen bar-keepers, resplendent in white shirts with wrist ruffles, and big diamond breast-pins—real, not paste!

The altar of Fortuna is altogether of a different shape and pattern, occupying more space. It is not compact, but extended over the floor, in the form of five tables, large as if for billiards; though not one of them is of this kind. Billiards would be too slow a game for the frequenters of El Dorado. They could not patiently wait for the scoring of fifty points, even though the stake were a thousand dollars. 'No, no! *Monté* for me!' would be the word of every one of them; or a few might say '*Faro*.' And of the five tables in the saloon, four are for the former game, the fifth furnished for the latter. Though there is but little apparent difference in the furniture of the two; both having a simple cover of green baize, or broad-cloth, with certain crossing lines traced upon it, that of the *Faro* table having the full suite of thirteen cards arranged in two rows, face upwards, and fixed; while on the *Monté* tables, but two cards appear thus—the Queen and Knave; or as designated in the game—purely Spanish and Spanish-American—'*Caballo*' and '*Soto*.' They are essentially card-games, and altogether of chance, just as is the throwing of dice.

In the El Dorado there are other modes to get rid of money, or make it, if chance so decides—a rare eventuality, save in the case of the professional gamblers themselves. In one corner of the saloon may be seen a roulette table; in another, a back-gammon board, with dice-boxes and cubes appertaining—not used for the simple innocent game which the light leathern case with its chequered cover represents, but in the dead naked casting of

dice—doubloons, or dollars, changing hands at every throw. Other gambling contrivances have place in the El Dorado: for it is a 'hell' of the most complete kind—but these are of slight importance compared with the great games, *Monté* and *Faro*—the real *pièces de résistance*, while the others are only side-dishes, indulged in by such saunterers about the saloon as do not contemplate serious play. Of all, *Monté* is the main attraction, its convenient simplicity—for it is simple as tossing 'heads or tails'—making it possible for the veriest greenhorn to take part in it, with as much chance of success as the oldest habitué. Originally Mexican, in California and other western states it has become thoroughly Americanised.

Of the visible insignia of the game, and in addition to the two cards with their faces turned up, there is a complete pack, with several stacks of circular shaped and variously coloured pieces of ivory—the 'cheques' or counters of the game. These rest upon the table to the right or left of the dealer—usually the 'banker' himself—in charge of his 'croupier,' who pays them out, or draws them in, as the bank loses or wins, along with such coin as may have been staked upon the cards. Around the table's edge, and in front of each player, is his own private pile, usually a mixture of doubloons, dollars, and ivory cheques, with bags or packets of gold-dust and nuggets. Of bank-notes there are few or none—the currency of California being through the medium of metal; at this time, 1849, most of it unminted, and in its crude state, as it came out of the mine, or the river mud. By the croupier's hand is a pair of scales with weights appertaining; their purpose, to ascertain the value of such little gold packages as are placed upon the cards—this only needed to be known when the bank is loser. Otherwise, they are ruthlessly raked in alongside the other deposits, without any note made of the amount.

The dealer sits centrally at the side of the table, in a grand chair, cards in hand. After shuffling, he turns their faces up, one by one, and with measured alowness. He interrupts himself at intervals, as the face of a card is exposed, making a point for or against him in the game. Calling this out in calm voice and long-drawn monotone, he waits for the croupier to square accounts, which he does by drawing in, or pushing out, the coins and cheques, with the nimbleness of a prestidigitator. Old bets are re-arranged, new ones made, and the dealing proceeds.

Around the tables sit or stand the players, exhibiting a variety of facial types and national costumes. For there you may see not only human specimens of every known nationality, but of every rank in the social scale, with the callings and professions that appertain to it; an assemblage, such as is rarely, if ever, seen elsewhere—gentlemen who may have won university honours; officers wearing gold straps on their shoulders, or bands of lace around the rims of their caps; native Californians, resplendent in slashed and buttoned velvetens; States' lawyers or doctors, in sober black; even judges, that same morning seated upon the bench—may be all observed at the *Monté* table, mingling with men in red flannel shirts, blanket coats, and trousers tucked into the tops of mud-bedaubed boots; with sailors in pea-jackets of coarse pilot, or Guernsey

smocks, unwashed, unkempt; unshorn; not only mingling with, but jostled by them—rudely, if occasion call. All are on an equality here; no class distinction in the saloon El Dorado; for all are on the same errand—to get rich by gambling. The gold gleaming over the table is reflected in their faces. Not in smiles, or cheerfully; but an expression of hungry cupidity—fixed, as if stamped into their features. No sign of hilarity, or joyfulness; not a word of badinage passing about, or between; scarce a syllable spoken, save the call-words of the game, or an occasional remark by the croupier, explanatory of some disputed point about the placing, or payment, of stakes. And if there be little light humour, neither is there much of ill-manners. Strangely assorted as is the motley crowd—in part composed of the roughest specimens of humanity—noisy speech is exceptional, and rude or boisterous behaviour rare. Either shewn would be resented, and soon silenced; though, perhaps, not till after some noises of still louder nature—the excited, angry clamour of a quarrel, succeeded by the cracking of pistols; then a man borne off wounded, in all likelihood to die, or already dead, and stretched along the sanded floor, to be taken unconcernedly up, and carried feet-foremost out of the room.

And yet, in an instant, it will all be over. The gamblers, temporarily attracted from the tables, will return to them; the dealing of the cards will be resumed; and, amidst the chinking of coin, and the rattling of cheques, the sanguinary drama will not only cease to be talked about, but thought of. Bowie-knives, and pistols, are the police that preserve order in the saloons of San Francisco.

Although the El Dorado is owned by a single individual, that is only as regards the house itself, with the drinking-bar and its appurtenances. The gambling-tables are under separate and distinct proprietorship; each belonging to a 'banker,' who supplies the cash capital, and other necessities for the game—in short, 'runs' the table, to use a Californian phrase. As already stated, the owner of such a concern is himself generally the dealer, and usually, indeed almost universally, a distinguished 'sportsman'—this being the appellation of the Western States' professional gambler, occasionally abbreviated to 'sport.' He is a man of peculiar characteristics, though not confined to California. His like may be met with all over the United States, but more frequently in those of the South and South-west. The Mississippi Valley is his congenial coursing-ground, and its two great metropolitan cities, New Orleans and St Louis, his chief centres of operation; Natchez, Memphis, Vicksburg, Louisville, and Cincinnati being places provincial, which he only honours with an occasional visit. He is encountered aboard all the big steamboats—those called 'crack,' and carrying the wealthier class of passengers; while the others he leaves to the more timid and less noted practitioners of his calling. Wherever seen, the 'sport' is resplendent in shirt-front, glittering studs, with a grand cluster of diamonds upon his finger that sparkles like a stalactite as he deals out the cards. He is, in truth, an *elegant* of the first water, apparelled and perfumed as a D'Orsay or Beau Brummell; and, although ranking socially lower than these, has a sense of honour quite as high—perhaps higher than had either.

## CHAPTER XX.—A MONTÉ BANK IN FULL BLAST.

In the saloon El Dorado, as already said, there are five gambling-tables, side by side, but with wide spaces between for the players. Presiding over the one which stands central is a man of about thirty years of age, of good figure, and well-formed features—the latter denoting Spanish descent—his cheeks clean shaven, the upper lip moustached, the under having a pointed imperial or 'goatee,' which extends below the extremity of his chin. He has his hat on—so has everybody in the room—a white beaver, set upon a thick shock of black wavy hair, its brim shadowing a face that would be eminently handsome but for the eyes, that shew sullen, if not sinister. These, like his hair, are coal-black in colour, though he rarely raises their lids, his gaze being habitually fixed on the cards held in his hands. Once only has he looked up, and around, on hearing a name pronounced—Montijo. Two native Californians standing close behind him are engaged in a dialogue, in which they incidentally speak of Don Gregorio. It is a matter of no moment—only a slight allusion—and, as their conversation is almost instantly over, the Monté dealer again drops his long dark lashes, and goes on with the game, his features resuming their wonted impassibility.

Though to all appearance immobile as those of the sphinx, one watching him closely could see, that there is something in his mind besides Monté. For although the play is running high, and large bets are being laid, he seems regardless about the result of the game—for this night only, since it has never been so before. His air is at times abstracted—more than ever after hearing that name—while he deals out the cards carelessly, once, or twice, making mistakes. But as these have been trifling, and readily rectified, the players around the table have taken no particular notice of them. Nor yet of his abstraction. It is not sufficiently manifest to attract attention; and with the wonderful command he has over himself, none of them suspect that he is, at that moment, a prey to reflections of the strongest and bitterest kind.

There is one, however, who is aware of it, knowing the cause; this, a man seated on the players' side of the table, and directly opposite the dealer. He is a personage of somewhat spare frame, a little below medium height, of swarth complexion, and straight black hair; to all appearance a native Californian, though not wearing the national costume, but simply a suit of black broad-cloth. He lays his bets, staking large sums, apparently indifferent as to the result, while at the same time eyeing the deposits of the other players with eager nervous anxiety, as though their losses and gains concerned him more than his own—the former, to all appearance, gladdening him, the latter troubling him! His behaviour might be deemed strange, and doubtless would, were there any one to observe it. But there is not; each player is absorbed in his own play, and the calculation of chances. In addition to watching his fellow-gamblers around the table, this eccentric individual ever and anon turns his eye upon the dealer—its expression at such times being that of intense earnestness, with something that resembles reproof—as though annoyed by

the latter handling his cards so carelessly, and would sharply rebuke him, if he could get the opportunity without being observed. The secret of the whole matter being, that he is a sleeping-partner in the Monté bank—the moneyed one too; most of its capital having been supplied by him. Hence his indifference to the fate of his own stakes—for winning or losing is all the same to him—and his anxiety about those of the general circle of players. His partnership is not suspected; or, if so, only by the initiated. Although sitting face to face with the dealer, no sign of recognition passes between them, nor is any speech exchanged. They seem to have no acquaintance with one another, beyond that begot out of the game. And so the play proceeds, amidst the clinking of coin, and clattering of ivory pieces, these monotonous sounds diversified by the calls 'Soto' this, and 'Caballo' that, with now and then a 'Carajo!' or it may be 'Just my luck!' from the lips of some mortified loser. But, beyond such slight ebullition, ill-temper does not shew itself, or, at all events, does not lead to any altercation with the dealer. That would be dangerous, as all are aware. On the table, close to his right elbow, rests a double-barrelled pistol, both barrels of which are loaded. And though no one takes particular notice of it, any more than if it were a pair of snufflers on their tray, or one of the ordinary implements of the game, all know well enough that he who keeps this standing symbol of menace before their eyes, is prepared to use it on provocation.

It is ten o'clock, and the bank is in full blast. Up to this hour the players in one thin row around the tables were staking only a few dollars at a time—as skirmishers in advance of the main army, firing stray shots from pieces of light calibre. Now the heavy artillery has come up, the ranks have filled, and the files become doubled around the different tables—two rows of players, in places three, engaging in the game. And instead of silver dollars, gold eagles and doubloons—the last being the great guns—are flung down upon the green baize, with a rattle continuous as the firing of musketry. The battle of the night has begun.

But Monté and Faro are not the only attractions of the El Dorado. The shrine of Bacchus—its drinking-bar—has its worshippers as well, a score of them standing in front of it, with others constantly coming and going. Among the latest arrivals are two young men in the attire of navy officers. At a distance it is not easy to distinguish the naval uniforms of nations—almost universally dark blue, with gold bands and buttons. More especially is it difficult, when these are of the two cognate branches of the great Anglo-Saxon race—English and American. While still upon the street, the officers in question might have been taken for either; but once within the saloon, and under the light of its numerous lamps, the special insignia on their caps proclaim them as belonging to a British man-of-war. And so do they, since they are Edward Crozier and Willie Cadwallader.

They have entered without any definite design, further than, as Crozier said, to 'have a shot at the tiger.' Besides, as they have been told, a night in San Francisco would not be complete without a look in at El Dorado.

Soon as inside the saloon, they step towards its

drinking-bar, Crozier saying: 'Come, Cad! let's do some sparkling.'

'All right,' responds the descendant of the Cymri, his face already a little flushed with what they have had at the *Parker*.

'Pint bottle of champagne!' calls Crozier.

'We've no pints here,' saucily responds the bar-keeper—a gentleman in shirt sleeves, with gold buckles on his embroidered braces—too grand to append the courtesy of 'sir.' 'Nothing less than quarts,' he deigns to add.

'A quart bottle, then,' cries Crozier, tossing down a doubloon to pay for it. 'A gallon, if you'll only have the goodness to give it us.'

The sight of the gold coin, with a closer inspection of his customers, and perhaps some dread of a second sharp rejoinder, secures the attention of the dignified Californian Ganymede, who, relaxing his hauteur, condescends to serve them.

While drinking the champagne, the young officers direct their eyes towards that part of the saloon occupied by the gamblers. They see several clusters of men collected around tables, some sitting, others standing. They know what it means, and that there is Monté in their midst. Though Cadwallader has often heard of the game, he has never played it, or been a spectator to its play. Crozier, who has both seen and played it, promises to initiate him. Tossing off their glasses, and receiving the change—not much out of a doubloon—they approach one of the Monté tables—that in the centre of the saloon, around which there are players, standing and sitting three deep. It is some time before they can squeeze through the two outside concentric rings, and get within betting distance of the table. Those already around it are not men to be pushed rudely apart, or make way for a couple of youngsters, however fine their appearance, or impatient their manner. In the circle are officers of far higher rank than they, though belonging to a different service: naval captains and commanders, and of army men, majors, colonels—even generals. What care these for a pair of boisterous subalterns? Or what reck the rough gold-diggers, and stalwart trappers, seen around the table, for any or all of them? It is a chain, however ill-assorted in its links, not to be severed *sans cérémonie*; and the young English officers must bide their time. A little patience, and their turn will come too.

Practising this, they wait for it with the best grace they can. And not very long. One after another, the infatuated gamblers get played out; each, as he sees his last dollar swept away from him by the ruthless rake of the croupier, heaving a sigh, and retiring from the table; most of them with seeming reluctance, and looking back, as a stripped traveller at the footpad who has turned his pockets inside out. Soon the outer ring is broken, leaving spaces between; into one of which slips Crozier, Cadwallader pressing in alongside of him. Gradually they squeeze nearer and nearer, till they are close to the table's edge. Having at length attained a position where they can conveniently place bets, they are about plunging their hands into their pockets for the necessary stakes, when all at once the act is interrupted. The two turn towards one another, with eyes, attitude, everything expressing not only surprise, but stark, speech-depriving astonishment. For on the opposite side of the table, seated in a

grand chair, presiding over the game, and dealing out the cards, Crozier sees the man who has been making love to Carinen Montijo—his rival of the morning; while at the same instant Cadwallader has caught sight of his rival—the suitor of Inez Alvarez!

### STORY OF BASSET.

THE story of Basset illustrates convict life, and is otherwise curious. The father of this wayward youth had been the blacksmith of the village, and died when he was a child. His mother was a woman of a kind heart, an easy disposition, and a weak will. She exercised little control over her son, who, as he grew up, was allowed to do much as he pleased. He was a bold, active, restless, and wilful boy, the first among his companions in every legitimate village pastime, and generally the first also in every mischievous prank and unlawful escapade. Quite undisciplined, and following in all things his own will and pleasure, he had not a bad or callous heart, and after his own wild, boyish fashion, loved his mother. After a long widowhood, Mrs Basset married again, and young Basset found in his new father one of as strong a will as himself. It was soon evident that the two could never live together on terms of agreement, and the stepfather determined that the boy must leave the house. He therefore apprenticed him on board a man-of-war, and young Basset took his departure. For a little time, while the novelty of the thing lasted, he liked his new life, but before very long he began to weary of it. His previous life had been the worst of schooling for the enforced discipline of the navy. He chafed at the restraint and control, longed once more to be his own master, and resolved to escape from what he had grown to regard as a bondage, on the first occasion that offered. Such an opening as he sought was longer in arriving than he had anticipated, but at last he thought it had come. A part of the crew of the vessel in which he served mutinied, and Basset engaged himself in the conspiracy, with the hope that it would prove successful, and afford him an opportunity for obtaining the freedom he yearned for. But the plot miscarried, and the mutineers were one and all sentenced to transportation.

It might have been thought that Basset would have made an unruly and difficult prisoner, but it was not so. He was naturally of quick perceptions, and his period of man-of-war service had had the effect of teaching him a certain amount of foresight and self-control. He soon took in the conditions of his position. He saw and heard of many instances of men who, by quiet conduct, had gained their freedom long before the term of their transportation was completed, and he knew of some of these same men who had attained in a short space to independence and comfort. He saw that a mitigation of sentence followed upon good conduct, not in exceptional cases, but as the rule, and he resolved to act accordingly. He would not chafe

or rebel against his present fate, but bear patiently, keeping always steadily in view the end at which he was aiming. Freedom was a passion in this man's nature, and the very longing for it now helped him in his determination to preserve a quiet and orderly demeanour, as the surest and speediest means of winning his liberty. For a long while this resolve held good. Basset's conduct was uniformly satisfactory. He was reserved and silent in his manner, and those in authority over him thought him sullen and moody, but otherwise they had no fault to find. So things went on with Basset until a circumstance occurred which was again to change the current of his life. He was at this time one of a gang of prisoners employed in building a bridge across a river. One day some failure in his duty on the part of Basset brought upon him the censure of the overseer. The thing had happened through no wilfulness of the man's, not even through carelessness, but was due wholly to inadvertence. But the overseer was in an irritable mood, his temper had been otherwise tried that morning, and his rebuke was sharp and peremptory. Basset received it in silence; but the suddenly darkening visage, which he could not wholly hide, did not escape the overseer. It magnified the prisoner's fault in his eyes, and it now appeared clear to him that this was a case that demanded some sharper treatment than mere words. He wrote the following note, addressed to the magistrate of the neighbouring township, and gave it to Basset to deliver:

'DEAR SIR—Please order the bearer (No. 73), twenty lashes; and oblige, yours very truly.'

This was a form of epistle very common in those days. The power of administration in regard to the flogging of the convicts was vested in the magistrates. Basset delivered the note, received his lashes as per order, and returned to his work. Next night, No. 73 was missing from the camp. He had made his escape to the woods. The man's naturally hot and hasty spirit had been again roused by the injustice which he had received, and his former resolves had given way. He had never been flogged before; during his sea-life, his quick temper and impatience of authority had never led him into any indiscretion punishable by the lash; his final transgression had brought its own prescribed penalty.

Search was made for Basset with all the vigour and vigilance which at that time attended the pursuit of escaped convicts; but in this instance it proved fruitless. The surrounding country had but recently been opened up, and was as yet little known. Basset got clear away to the woods, and penetrating daily deeper into the fastnesses of the forest, fell in with a small tribe of black fellows, with whom he at once cast in his lot. He knew that this would be the surest of all means which he could adopt to make good his escape. His new acquaintances extended to him all the hospitality within their knowledge, and their unsuspicious demeanour won his confidence. Mingling with the uncouth savagery of their life, he found gentler traits of character, which made existence among them tolerable. His life now approximated, as nearly as possible, to that of those around him. He soon spoke their language, learned to hunt and

trap the wild animals which supplied them with food—the kangaroo, the wallaby, and the native bear; learned to lure the bird to the snare by the simulated call and whistle, taught himself to shoot with the bow, to hurl the boomerang and the javelin, to spear the fish in the river, to fashion cunningly with his own hand the rude but deadly implements of the chase; and in all these, and the various other arts of savage life, he became as skilful as the most expert of those about him. Ere long, too, the ascendancy of his higher race exerted and manifested its influence. Tacitly, his dark-skinned companions confessed his supremacy, obeyed his will, and established him as their leader and king.

Basset was now tasting freedom in its most unrestricted forms, and for a time he enjoyed it keenly, yielding himself with heart and mind to its wild delights, its unfettered *abandon*, and freedom from all care beyond the day. The nomadic instinct, which is inherent, though often dormant, in most men, and which was especially strong in him, now had full scope and liberty. The authority, too, which he exercised over his swarthy comrades in the camp and the chase sweetened his wild existence. But the time came when these pleasures palled upon him. The companionship of his uncouth though faithful followers grew irksome to him, and the power he wielded over them lost its zest. He cast about how he might best escape from the tribe, and was at last successful in eluding them. He buried himself in the recesses of a remote mountain gully, which he had one day by chance wandered into during a solitary hunting expedition, and of the existence of which he felt certain that his companions were ignorant. The black men sought their missing chief in vain, and then mourned for him as dead. It was a wild, lonely, yet beautiful spot which Basset had made his retreat; a deep and narrow rift in the heart of the hills. The mountains, steep, high, and rugged, walled it in on every side, and at its bottom flowed a bright and rapid torrent. The vegetation was of supreme luxuriance and beauty; a matted network of trailing greenery bound the forest together in one impenetrable mass. It was a spot where the virgin forest had never yet been touched by the white man's axe, or the black man's hunting-knife; where probably no human foot had trod before Basset's; where, perhaps, the echoes had slumbered unawakened, save by the cry of wild-birds, since the creation. Basset cleared a space on a small grassy plateau at the head of the gully, and here, with the stems of fallen gum-trees, withes of the willow, and clay from the bed of the stream, built himself a hut. About him and above, the pines and the she-oaks waved and sang, the torrent sang beneath. Soon he began to feel the want of sufficient occupation. To one of his restless activity of mind and body, inaction was a burden. The capture of such animals and birds as he required for food employed but a small part of the day. He did not usually stray far outside the confines of his mountain valley, lest he should again meet with any of his late companions; but one day he had wandered a long way beyond the boundaries of the gorge. He had left the mountains behind, and had descended upon the plain. Wandering on, with no fixed purpose in his mind, he came upon a solitary homestead standing in

the midst of a level, well-grassed country, sparsely sprinkled with woodland. It was the dwelling of Hugh Kavanagh, a spirited and adventurous squatter, who, seeking new and wider pastures for his increasing flocks, had pushed farther and farther into the interior of the country, until his last, and what he thought would be his final resting-place was one of the remotest stations in the colony. As Basset contemplated the home of Mr Kavanagh and its surroundings—the garden in front, and the small farmyard and out-houses in the rear, an air of thriving and civilised comfort pervading the whole—an idea took possession of him. Concealing himself in the neighbourhood, he waited till nightfall. When all lights had been extinguished in the house, and everything seemed quiet and at rest, Basset stole from his hiding-place. First he entered one of the out-houses, and stealthily explored its interior. It was a bright moonlight night—a circumstance which assisted him greatly in his enterprise. At one end of the place he found a goat and two kids, and at the other several lambs with their mothers. He took the goat and its kids. Then he entered the garden in front of the house, and gathered several plants of flowers and vegetables, carefully taking them up by the roots. He was guided by no choice in the matter, selecting the plants as they came, but he made no wanton destruction among them, taking as many only as he wanted. Withdrawing with his stolen booty, he placed the plants in his game-bag, slung the goat and the kids on his shoulder, and made his way back to his mountain home. A few nights after, he returned to the scene of his depredations, and repeated his former exploit. He now took a sheep and two lambs; and besides these, a spade and a hoe, and a quantity of different kinds of grain from the stalls.

Basset had now the means of creating occupation for himself. He tilled the little plateau on which his hut was raised, and planting his flowers and sowing his grains, he cultivated, tended, and nursed the patch of ground morning and night with assiduous care. The copious dews of evening watered it, the soil was rich in its virgin strength, and in no long time a garden blossomed and smiled, and a little corn-field waved like a golden billow around the log-hut. For his kids and lambs, Basset built a small fold; the creatures multiplied until a little flock demanded his further care. The pleasure and pride of ownership which he now experienced in the possession of his garden, his field, and his live-stock, was a new and very agreeable feeling to him. He enjoyed perfect freedom, together with a certain sense of civilisation. He was dependent upon no man; he was entirely self-sufficing and self-supporting. Now and then, indeed, at long intervals, he paid a visit to Mr Kavanagh's station, and—well, stole several articles which it was beyond his resources to produce himself. On one occasion, finding the family all from home during the day, he entered the house itself, and took thence a number of books. To the reading of these he gave himself in the hot summer noons and the long winter evenings. They were an odd and miscellaneous assortment, for he had picked them up promiscuously from Mr Kavanagh's tables and shelves as they came to his hand. But Basset read and re-read them, whether fact or fancy, without much thought of

discrimination, until he knew a great part of their contents by heart.

Thus the hermit lived, solitary, but sufficing for all things in himself, and for five years he was contented and happy. He thought he could live thus for ever; but he was mistaken. The life he had been leading for the past five years had, unconsciously to himself, been working a gradual but decided change in the man's nature. His life with the blacks had rather tended to develop all that was wild, reckless, bold, and headstrong in his nature. He had given full rein to the nomadic bias within him; his heart had pulsed in accord with the untamed hearts of those around him; exulting in the same fierce joys, ruling over his companions chiefly by the exercise of a more dominant will. The influences that now operated upon him were almost all of a diverse kind. His occupations were of a tranquil and peaceful sort; for he now hunted very little, his garden, his sheep, and his goats supplying him with the greater part of his daily food. In the pursuit of these tranquillising employments, his blood cooled, his pulse grew calmer, his spirit less hasty and restless. A change was coming over him.

Basset sat in his cabin in the long nights, and, in the pauses of his reading, listened to the wild commotion outside—to the wind, now tearing and shrieking amid the rocks and the shuddering trees; now sobbing and moaning in a weird, half-human voice; now creeping close up to his door, and whispering hoarsely under the lintel, as though half-begging, half-commanding admittance. These wind-voices, together with the voice of the torrent, took various and many shapes in his mind, and laid hold of his imagination. Among the books which he had taken from Mr Kavanagh's house was one of German legends, grim, fantastic stories of the mysterious and the supernatural. On stormy nights, sitting by his lonely wood-fire, his fancy peopled the tumultuous elements outside with the strange beings of these old legends; he could imagine a legion of storm-spirits abroad on the wind, to whose turbulent dominion the valley had for the time been surrendered. On calm nights he would walk along the gorge, but it was a lonely sort of pastime. The wan wintry moonlight filled the place with a weird eerie sheen, and the gut-trees glimmered on every side, white and haggard looking, like melancholy ghosts. Gradually these influences had an awing effect upon Basset's mind. The intense solitude of the mountains, which in stormy seasons became desolation, was beginning to overpower, and almost to cow him. Whatever of wilfulness and stubborn-resistance was innate in him, was becoming tamed and subdued. He now acknowledged no human master, and the stern impassive forces of nature were overmastering him. His lonely liberty was making him a grave, thoughtful, and joyless man. He went about his daily occupation in his garden, his field, and among his animals, but they were ceasing to yield him the satisfaction and the pleasure which they had once done. He betook himself more and more to his books, among which were a *Pilgrim's Progress* and an odd volume of Shakespeare. These he pondered and brooded over, and though blundering sometimes in their interpretation, came, nevertheless, to a pretty clear general understanding of what he read.

Seven years in all he passed in his valley, seven

golden summers, seven stormful and dreary winters, and then the solitude had fairly overmastered him. Absolute freedom had worn him out.

It was again summer, a calm and beautiful evening in November. Mrs Kavanagh sat at the door of her house, working at some piece of sewing, watching the sunset, and awaiting the return of her husband from his day's occupation. Her two children, a boy and girl, played together near at hand. As she looked up ever and anon, to view the fading sunset, and to gaze in the direction whence her husband should appear, a figure came suddenly into her field of vision, emerging from the scattered clumps of woodland that fringed the horizon line. It could not be her husband, for it was the figure of a pedestrian. It advanced steadily, and the clearer its outlines became, the more unfamiliar it looked to Mrs Kavanagh's eyes. When at length she made out distinctly the appearance of the stranger, some slight discomposure mingled with her wonder. The man advanced till within half-a-dozen yards of where she sat, and then paused. For a woman, Mrs Kavanagh was not easily frightened. The wife of an Australian backwoodsman in those days sometimes felt the advantage of a steady heart and nerve, and frequently acquired both. But Mrs Kavanagh's pulse quickened and her heart beat faster as she regarded the strange figure before her, clad in rough goat-skins, with long thick hair falling over his shoulders, a face worn and haggard with solitude, half-hidden in a dark flowing growth of beard. The children were crouching about their mother's knees—the girl hidden completely amid the folds of her dress, the boy peeping timidly forth with eyes of startled wonder. Yet Basset had not a repulsive face, and his form was straight and shapely. He was still in the prime of life, and the influences that had furrowed and aged his face had not bent his body. A painter might have taken him as he stood as a model for the prophet John, worn out with the wilderness and long preaching, and not have needed to idealise much. His eyes had a hollow, wearied look, but were not wild. He paused a few moments before he spoke, and then said: 'Is the master at home, missis?'

'No; but I expect him every minute,' Mrs Kavanagh replied.

'Then, with your leave, missis, I'll wait for him;' and without speaking more, Basset seated himself on the ground.

At that moment Mrs Kavanagh caught sight of her husband advancing rapidly on horseback. She went forward with the two children to meet him; and Kavanagh checked his horse, and alighted, as they approached.

'Hugh,' said Mrs Kavanagh quickly, 'here is a man wishing to see you—a strange, wild-looking creature, I never saw before.' In another moment the two men stood face to face.

'Mister,' began Basset, with a slight motion of his hand, indicative of a desire to be allowed to speak first, 'my name is Basset. I am a convict, a lag. I escaped twelve years ago. Some'll say that was wrong; maybe it was, and maybe they'd have done the same, if they'd been me. But let that go. I've been living in the woods ever since—a long time with the blacks, a long time by myself, as you see me. Maybe you will wonder when I tell you I have got a good many things

together up there in the mountains. Well, I stole 'em—I stole 'em from you; came down here, and took 'em away at night, but, as Heaven is my witness, I never took more'n I needed; and now you can have 'em, most all, back again. Some of the things, the sheep and the goats, has more'n troubled. I'm tired out living alone. I've given in. You can do with me as you like, master: keep me about the place, if you can; give me up to the beaks, if you must.'

Basset spoke in a quiet composed voice, but as he uttered his last words there was a slightly eager, questioning look in his eyes. Kavanagh was surprised, perplexed. True, the man had confessed that he had more than once robbed him, but Kavanagh felt thankful that he had done no more. He might have visited the house in his absence and murdered his wife and children. Kavanagh every now and then heard of such things, deeds of ruthless cruelty done by escaped convicts, men who, turning bush-rangers, held the parts of the country which they frequented in terror by the audacity of their crimes, until recaptured or reduced to surrender by starvation. But this man had lived, seemingly, a very different kind of life, and had done no worse than steal a few things from him, the want of which had never been felt. Moreover, he seemed thoroughly tamed and subdued by the life he had led. Kavanagh had a warm and generous Irish heart, and Basset's story awoke in him sympathy and interest. But he was in doubt how to act.

'What do you want me to do for you, my man?' he asked at length.

'Could ye keep me about the station, master—shepherding or such?' queried Basset hesitatingly.

'That would hardly do: against law, you know,' replied Kavanagh doubtfully.

'Yes, so I suppose. Well, do what you please, master.'

'I'll try and do my best for you,' pursued Kavanagh. 'You can stay here to-night, and I'll think the matter over before the morning.'

That night, Kavanagh and his wife deliberated the matter gravely, and agreed finally as to what was best to be done. Early next day, Kavanagh started for Hobart Town. He was a well-known man in the colony, an old settler, a rich man now, whose wealth gave him position and influence, while his personal qualities made him respected and liked. He had Basset's case before the authorities, and pleaded the cause of the escaped convict with earnestness and wisdom; and he was successful. The law was merciful, and Kavanagh returned home with a free pardon for his client.

For several years Basset remained on Mr Kavanagh's run as one of the regular station hands. During that time he remained always the same—docile, trustworthy, and hard-working, genuinely grateful for his changed lot. When, in 1853, the transportation of criminals to Tasmania ceased, Mr Kavanagh offered him a piece of land in the vicinity of Hobart Town, and proposed to him that he should turn market-gardener. The idea was to Basset a congenial one, and he immediately accepted Mr Kavanagh's offer. Years went by, and he prospered, until he had made for himself a moderate competence, and his name came to be spoken of with honour and respect.

If there be any among our readers who have ever visited the beautiful little Tasmanian capital,

they will remember how the town is girdled with pleasant gardens and smiling orchards, lying along the slopes of the adjacent hills. Any one of these may have been the property and contained the home of Basset the ex-convict.

## THE TWO BACHELORS.

IN TWO PARTS.—PART II.

THE warm August days ripened into mellow September. Since the night of Jack's reverie, a change had certainly come over him, but as yet he left me uninformed as to the cause. Sometimes his old gaiety would return, but it was sure to be followed by a fit of more sombre silence than before. I chaffed him about it often, but his testy replies invariably shut me up. We never met Miss Hallam, and the only time we saw her was in the morning among her flowers, or in the evening, when, after having ravished us with her music, she stepped out on the balcony, leaning on her father's arm, to enjoy the moonlight. On such occasions Jack seemed strangely affected, and would either break forth into voluminous praises of her grace and beauty, or sit gazing mutely at the apparition. Such a state of affairs led me naturally enough to the conclusion that whatever might be the matter with Ferrars, the fair cantatrice had something to do with it.

One afternoon we resolved to have a row down the loch, and as I crossed the lawn with an oar over each shoulder, I chanced to glance at Colonel Hallam's window, where the two ladies were seated sewing. The younger one was scanning me with a half-amused expression in her brown eyes; and as Jack came sauntering down the gravel-path with a hand in each pocket, I quietly said: 'Miss Hallam's at the window.'

He looked in the direction I indicated, and, to my surprise, he immediately blushed up like a girl.

'Why, Jack, old fellow, what's the matter?' I asked, with a smile I could not repress. Miss Hallam was viewing us with the aid of an opera-glass.

'Pshaw! Harding, get on board quick, and row as well as you can,' he answered, throwing himself into the stern of the boat, in a position where the sunshine struck forcibly on his handsome face and auburn locks.

I bent as gracefully as I could to my oars—I had been a fair oarsman at Cambridge—and soon the little craft was skimming far over the sunlit ripples.

As it was still early when we returned, we strolled down the road until it would be time to go in for dinner, when, turning a corner, we came suddenly upon Miss Hallam and her father, mounted on a couple of splendid grays. As she cantered past us with a smile, her beautiful face flushed with the exercise, I certainly thought I had never seen any one half so lovely. Her perfect form; the grace of every fold of her dark-green riding-habit; the indescribable coils and twists of her brown hair, with the sunshine shading it to gold; the coquettish little felt hat turned up on one side, with its dancing plume and streaming gossamer—combined to make up a charming *tout ensemble*, which was altogether irresistible. Jack had stared after her in open-mouthed admiration for such an indecent length of time, that I was constrained to accuse him.

'Ferrars, you admire Miss Hallam,' I said.

He had his head bent, and was kicking the dead leaves with his feet as he walked. When he raised his blue eyes, they were filled with the expression of a passion I had never noticed in them before, and which fully corroborated the four words he uttered, as his eyes met mine: 'I do love her!'

Strange as it may seem, I was thunderstruck at the announcement. Much as I had noted the change in Ferrars, I had hesitated to ascribe it to the circumstance of his being in love. I protested and raged against such folly—falling in love with a lady with whom he had never exchanged a single word. For answer, a passionate confession was poured into my astonished ears, in which he vowed he must, and would win her. Matters were made considerably worse when we received our letters that evening informing us of business engagements requiring our immediate return to town. It would be impossible for us to remain more than three days longer.

'Humph! your time is rather limited, Ferrars,' I said, with more sarcasm than sympathy. 'You'll be a pretty sharp fellow if you woo and win a handsome girl in three days.'

The next morning he came down to breakfast looking pale and haggard. I don't believe he had slept all night, but I made no inquiries, as I felt annoyed at this alarming impulse of my old friend, and was altogether out of temper with this adventure of his. He ate little or no breakfast, and looked so dejected, that at last my sympathies were aroused, and I shouted cheerfully: 'Cheer up, old fellow; we'll manage it all beautifully, and you'll go up to London the accepted suitor of Miss Hallam.'

Gradually he became more animated, and began to talk, and finally quite shocked me by declaring that he was going to write and propose to Miss Hallam that very day. I considered him to be simply mad, but he had apparently thought it well over, and was determined what course to adopt.

'But, Jack, the thing is preposterous,' I argued; 'she knows nothing about you. Can you expect anything but a distinct refusal?'

'And what would you recommend?' he asked, curling his upper lip as he waited for my advice.

'Why, get introduced to her first, and wait at least until you know her a little before you make such a proposal,' I said.

'Have I not been waiting for the last two months?' he answered. 'And do you forget that in two days I must leave this place? There is no time for waiting now; it must be action, immediate and peremptory!'

'And are you quite determined to do—this—this thing?'

'Quite.'

'And will nothing persuade you that it is an extremely foolish action, and one which will be certain to defeat all your wishes?'

'Under the circumstances, I consider it the only thing to be done.'

I succumbed. In difficulties of a different nature he had generally proved a better diplomatist than I, and perchance his skill might extend to this department also.

'Well, if it must be action, as you say it must, action let it be; you must write your proposal,' I said, pulling out the writing-materials with alacrity, and placing a chair for Jack at the desk; and

after a full hour's scribbling down and scratching out, a clean copy was penned, which ran as follows :

DAIL D'ARROCH LODGE, Sept. 22, 1861.

DEAR MISS HALLAM—I regret that circumstances have prevented me making your acquaintance ere I address to you words, which, I pray, you will not think lightly of, from the mere fact that I have never spoken to you. Since I came here, two months ago, you have excited my intense admiration, which feeling has lately ripened into a deep and passionate love.

My business engagements now demand my immediate return to London, but I feel that I cannot go without first learning from you my fate. I make you now an honourable offer of my hand in marriage, and beseech you not to think lightly of it, as on your decision must depend my life's happiness or misery. If possible, an answer per to-day's post will very much oblige.—Yours respectfully,

JOHN FERRARS.

'That will do,' I said, holding the sheet, covered with Jack's neat handwriting, at arm's-length. 'Concise; to the point; not too spoony; slightly formal; but under the circumstances it is better so.'

Jack folded the letter and addressed it; and with serious misgivings at my heart, which I dared not express, I walked with him to the post-office, and saw him drop the missive into the box. We did nothing all day but lounge about the house and garden, waiting anxiously until the postman would bring the letters in the evening. At length, the weary day passed, and the letter-carrier arrived; and sure enough there it was, a little pink note, addressed to John Ferrars, Esquire. My heart beat as quickly as if it were my own happiness that was at stake as Jack broke the seal. I looked over his shoulder, and what we both saw was :

Wednesday Afternoon.

DEAR MR FERRARS—I accept the great honour you have done me. Before, however, meeting you, I would like you to see papa, and obtain his consent to our engagement.—Yours, sincerely,

EUNICE HALLAM.

There is an old adage that says 'truth is stranger than fiction,' and if ever I felt the force of it, it was as I read that note. Contrary to all my expectations, Jack had actually been accepted! He bore his good-fortune with much more equanimity than I did, his only remark being: 'Eunice—what a pretty name!' While I, with strangely mixed feelings, actually got up a 'hurrah!'

The next difficulty was, how or where to meet Colonel Hallam and obtain his consent. An idea seized me; I had seen the old colonel walk down the road a short time before. 'Stay you here,' I said to Jack; and putting on my hat, off I bolted. I had not gone far when I espied the colonel leaning on a wire-fence, watching some workmen digging a drain. Pretending to be interested in the same pursuit, I walked up to him, and made some remark regarding the work. Thereafter we got upon the most friendly terms, which ended, as I intended it should, by his walking home with me, and coming into the house to join us in a rubber at whist. I conducted him into the dining-room, and went for Jack. He began to get slightly nervous when he heard what I had done, but I told him not to say anything to the colonel about his daughter to-night, only to make

himself as agreeable as he could. I then instructed Mrs Mason to set down the very best she had in the house for supper, and went to entertain our interesting guest. We found him a charming old gentleman. At whist, he and dummy beat Jack and me; and possessing an inexhaustible fund of humorous stories, the time passed so pleasantly that it was twelve o'clock before he rose to go.

A cordial invitation to visit him was extended to us, as we bade him good-night in the hall, which was exactly what I wanted, and meant we should have. Pulling a grave face, I said: 'Nothing would have given us greater pleasure had we been staying longer, but we were to leave for London the day after to-morrow.'

'Then you must spend to-morrow evening with me,' was his hearty rejoinder. 'I will take no refusal.'

And to this arrangement we agreed.

'A thousand thanks to you, Bob; you're a capital fellow,' said Jack, gratefully grasping my hand as we separated for the night.

'Ferrars!'

'Hollo!'

'Are you ready?' I was donning my dress-suit preparatory to presenting myself in Colonel Hallam's drawing-room.

'Yes.'

'Come here, then.'

He came in, dressed for conquest evidently, and looking faultlessly handsome. I surveyed him critically. There was not an item amiss, from the *négligé* arrangement of his auburn curls, to the polish of his patent leathers.

'How do I look?' he asked, with a gay laugh, and a satisfactory glance at his magnificent proportions in the mirror.

'Like a Polish prince,' I answered. 'Miss Hallam may have many lovers, but I'll bet a new hat she never had a better-looking fellow than you. Now, look here; you'll do exactly as I tell you, and not diverge one iota from the rule I lay down. Ask for Colonel Hallam, and say you wish to see him alone. When the first greetings are over, you'll explain to him that Mr Harding is detained for a short time with a little packing he had to finish, and that you did not wait for him, as you had something to communicate to him—the colonel. Then pitch into the subject nearest your heart; tell him of your business and social connections, and don't neglect to impress him with the fact that you're your mother's only son, and heir to her fortune and estates. These sort of things go a long way with the old boys.'

Having thus delivered my advice to Jack, I sent him off to push his sentimental fortunes with Colonel Hallam, and sat down pensively to smoke a cigar, before following him. About half an hour afterwards I sallied forth, and a minute or two found me ringing at the colonel's front-door. My heart beat audibly, as, following the servant upstairs, I heard the sound of a piano, and Miss Hallam's voice merrily humming a bar or two of some lively air, and felt much relieved when the door of the library was thrown open, and I found myself ushered into the presence of only Colonel Hallam and Jack. One glance at Jack's flushed and radiant face, as he stood leaning against the marble mantel-piece, sufficed to assure me that all had gone 'merry as a marriage-bell' with him,

and with a feeling of thankfulness I returned the colonel's cordial greeting.

'Come away, now, and see the ladies; I know this boy is getting impatient,' he said, with a twinkle in his eye, as he laid his hand familiarly on Ferrars' shoulder.

'It's all right, old boy, and I'm the happiest fellow alive,' whispered Jack, as we followed the colonel down-stairs; but I had only time to grasp his hand and give it a squeeze of congratulation, when the drawing-room door was opened, and we entered.

The elder lady was seated on a couch beside the fireplace, where a fire had been lighted, for the evenings were getting chill; the younger was leaning on the grand piano, engaged in looking over some music. Both stood erect when we entered. The colonel, going over to the elder lady, took her hand, and led her forward, saying as he did so: 'Ennise, I have much pleasure in introducing Mr Ferrars to you.—My daughter, Mr Ferrars.'

Ferrars turned deadly pale. 'And—the other—lady?' he gasped, looking round at the beautiful young girl standing at the piano.

'My wife.'

I don't suppose our consternation could have been greater had a bomb-shell entered the apartment. Jack would have fallen had I not supported him. Every one seemed to take in the situation at a glance. Miss Hallam did not faint or scream, or do anything which a younger or more sentimental lady in similar circumstances might have done, but she blushed as deeply as her faded complexion would allow of, and, covering her face with her hands, said: 'Oh, how dreadful! he has thought Nelly was my father's daughter.' Mrs Hallam glided to her side and led her from the room, while the colonel and I applied restoratives to poor Jack's colourless lips.

'Poor fellow,' muttered the colonel; 'I see his unlucky mistake. I wish, for the sake of everybody concerned, this had not happened.'

'This explains the ready acceptance of Ferrars' proposal, and the colonel's willing agreement to let his daughter marry a comparative stranger,' I inwardly growled, in disdain of the whole business, as I loosened the tie which Jack had so carefully arranged an hour before.

When he had somewhat recovered, we took him home, and laid him on the sofa in the dining-room. I sat by him all the evening, and although he did not seem in the least excited or feverish, he kept asking me such strange questions, and seemed so unconscious of all that had transpired, that I was afraid his brain was affected. I, however, was determined that we should not on any consideration remain a day longer in Dail d'Arroch; and summoning Mrs Mason, I instructed her to get our traps ready, as we required to be off by the first steamer in the morning. 'Mr Ferrars does not feel very well,' I added, in reply to a glance of inquiry she cast at Jack as he lay motionless on the sofa. 'He has had unpleasant news from home.'

My conscience smote me for the deliberate falsehood I uttered, but I felt that some excuse was necessary for the prostrate condition of Ferrars. But Mrs Mason was so profuse in her expressions of sympathy, that somehow or other I could not help conjecturing that she guessed somewhat of the truth.

At seven o'clock the next morning, a close carriage was drawn up to the door, and Jack and I were driven for the last time down the trim avenue, and arrived at the pier in good time to catch the steamer. Ferrars' manner was unnatural and excited, and I felt as if I dared not leave him for an instant. What need to relate our miserable journey south; enough to say that when we reached London, Ferrars was in the delirium of fever.

The attack proved a virulent one, and for six weeks he lay partly unconscious, even after the delirium had left him. When at last he began to recover, I took a run down to the Isle of Wight with him, leaving him in charge of his mother, who was staying there. In the course of six weeks he came back, looking almost as well as ever. He shewed me a letter which he had received from Colonel Hallam, in which that worthy gentleman expressed his deepest sympathy. The letter went on to say that the writer had adjusted matters at home as delicately as he could; and that, had he for a moment supposed that Mr Ferrars had mistaken his wife for his daughter, his friend should have been spared the unfortunate dénouement in the drawing-room.

The occurrence which so nearly cost him his life was never again reverted to by us. And up to this date at least, he seems quite contented with his bachelor chambers and the society of his old friend Bob Harding.

#### ANECDOTES OF DAN O'CONNELL.

BY THE AUTHOR OF 'LIVES OF THE LORD CHANCELLOES OF IRELAND.'

Now that the centenary of O'Connell's birth has been celebrated, so many recollections of

That wonderful man,

Called *par excellence* 'Counsellor'.—playfully Dan,

have been stirred, I desire to add a very few of mine to the number. I was acquainted with him personally; we were members of the same profession—the Bar; and our creed and politics were identical. It is not my intention, in these Circuit Recollections, to dwell upon his career as a politician—that is more the province of the party newspaper or the political treatise, and has already been a theme for many pens. I prefer to dwell more upon his fame as a barrister. I often wished the sayings and doings of our distinguished advocates were better preserved. There has always appeared to my mind much in common between actors and advocates; both come upon the stage, and play their parts, representing, with all the ability in their power, the character for whom they appear. The sorrows of the injured plaintiff, the innocence of the accused prisoner, are powerfully proclaimed; and, after a trial of considerable length, in which wit and wisdom, drollery and profound learning, are alike displayed, the auditor leaves the court impressed with much the same notion of the powers of the advocate as he feels when leaving the theatre after witnessing the representation of a first-rate actor. But while the theatrical critic records the actor's fame, the personal characteristics of the barrister are too

often lost. Few in court have time or inclination to note his points, his humorous sallies, his ready and often felicitous jokes, his dramatic by-play. Let me endeavour to rescue the names of some of my brethren on circuit from oblivion. They were men of high personal and intellectual worth, and when I mention that mine was the Munster Circuit, I have said enough to recall the name and fame of the greatest advocates in Ireland.

Here, in former days, flashed the wit of Curran, the intrepid oratory of FitzGibbon (afterwards Earl of Clare), the drollery of Harry Deane Grady, the quaint pleadings of Recorder Wagget, the wonderful versatility of O'Connell. Here, in later years, were heard the dulcet voice of Pigot (afterwards Lord Chief Baron of the Exchequer); the astute arguments of Stephen Collins, the Chitty of the Irish Bar; the rapid utterance of Harry Cooper; the stately and powerful eloquence of Jonathan Henn; the close and pointed statements of T. D. FitzGerald; the clear and logical reasoning of Deasy; the masterly speeches of Sullivan (now Master of the Rolls of Ireland); and here to-day the fame and renown of the great Munster Bar are worthily sustained by Heron, Gerald FitzGibbon, Murphy, Exham, and several other barristers of transcendent ability. O'Connell had a wonderful knack of what was termed *insinuating a speech to the jury*, prior to the Act which gave prisoners the benefit of counsel. Indeed, he acquired the knack of insinuating not one but half-a-dozen speeches to the jury in any case. His mode was this: when cross-examining, he asked some question which he knew would be objected to. When the witness was told: 'Don't answer that question,' O'Connell gained his opportunity. He would say: 'You see, my lord, I have every right to ask that question, for if the witness answers in the affirmative, it is plain my client's innocence is proved, because, &c. He possessed an extraordinary knowledge of his fellow-countrymen—the real cunning concealed by a stolid demeanour, the tact and cleverness covered by apparent simplicity. He often hazarded a guess at their thoughts, and seldom failed to hit off his point. Thus, when defending a man for a homicide, the principal witness for the prosecution was said to have been drinking with the prisoner before the affray. O'Connell sought to shew he had drunk too much whisky to be able to give a satisfactory account of the affair. Yet the man swore he only took his share of a pint of whisky. 'You only took your share,' repeated O'Connell with emphasis. 'Now, on your oath, was it not all *but the pewter*?' The witness admitted the fact, and the astute counsel obtained the acquittal of the prisoner.

O'Connell defended a man tried at the Cork assizes for murder. The case for the prosecution was exceedingly strong. The principal witness had picked up the hat of the man on trial, near the body of the murdered man. The prisoner's name was Pat Hogan. The hat was produced in court. O'Connell asked to see it, and it was handed to him. 'Now,' said O'Connell to the witness, 'you are quite sure this is the hat you found?'

'Yes, your honour counsellor.'

'And the hat is in the same state now it was then?'

'O yes; just the same.'

O'Connell looked inside, and spelled P A T.

H O G A N. 'Do you mean to say the name was in the hat when you found it?'

'I do—on my oath,' said the witness confidently.

'You are certain of that?'

'Quite sartin.'

'Now you may go down,' cried O'Connell. 'My lord,' he said, 'there must be an acquittal: *there is no name at all in the hat.*' The jury at once, under the judge's direction, found the prisoner 'Not Guilty.'

O'Connell was counsel for an heir-at-law whose rights were threatened by a will found, it was alleged, in a desk of the late owner. The genuineness of the will was disputed; but the witnesses swore point blank to the signature of the testator as having been affixed when 'life was in him.' The recurrence of this phrase, 'when life was in him,' struck O'Connell. When cross-examining, he said: 'Now, witness, answer my question as you shall have to answer before the judgment-seat of God! Was not there a fly in the dead man's mouth when his hand was held to this paper?' Confused and trembling, the witness replied: 'There was.'

O'Connell's drollery was often displayed during the assizes. When stating the injury done to a client who brought an action against the Earl of Bandon for diverting a water-course, the defendant's attorney's face was a good index to his devotion to Baccus. His name was O'Flaherty, and O'Connell said: 'So completely was the stream diverted from the plaintiff's mill, there was not sufficient water left as would make *grog* for O'Flaherty.'

When applying to change the venue of a case from Dublin to Tralee, the motion was resisted by a very unprepossessing-looking barrister, whose politics were averse to Kerry-men in general, and O'Connell's in particular. This gentleman contended 'there was no necessity to send the case to Kerry—a county very remote—where he had never been, and was very inconvenient.'

'I can promise my learned friend,' replied O'Connell, 'a hearty welcome; and we'll shew him the lovely Lakes of Killarney.'

'Ay,' growled Mr H—; 'the bottom of them.'

'O no,' replied O'Connell. 'I would not frighten the fish.'

His practice on circuit was so great, he was usually retained in all important records; and when required to defend prisoners in the criminal court, while the records were trying in the next court, not having the ubiquity of Sir Boyle Roche's bird, could not be in both places at once. When engaged in defending a notorious Whiteboy named Lucey, he was often sent for to attend in the Record Court, where a very important case in which he held a brief was at hearing. He refused to leave the Crown Court while his client's life was in jeopardy; but when the jury returned their verdict, 'Not guilty,' O'Connell appeared in the civil case.

'Where were you all day?' asked Sergeant Jackson. 'You were badly wanted here.'

'I could not leave the Crown Court; I was defending Lucey,' replied O'Connell.

'What was the verdict?'

'Not guilty.'

'Then you have acquitted a wretch,' said Sergeant Jackson—'a wretch unfit to live.'

'I am sure, my dear Jackson,' responded

O'Connell, 'you will allow, if Lucey be unfit to live, he is still more unfit to die.'

When judges in Ireland are unable from illness, or other cause, to go circuit, a sergeant is usually sent instead. The sergeants in Ireland are only three in number, and take rank after the Attorney and Solicitor General; but as these law officers direct the prosecutions, and on great occasions personally appear for the crown, they are therefore disqualified, while holding office, from presiding on the bench. Mr Sergeant Lefroy was known to take great interest in religious matters, and the recent biography, written by his son, shews what a truly pious man he was. Fresh from taking part in a meeting for the conversion of the Jews, Sergeant Lefroy went as judge on the Munster Circuit. A man was tried before him at Cork, indicted for stealing a number of valuable coins. Several were from the Holy Land, others of the time of Caesar. O'Connell, who was defending the prisoner, heard the judge ask for the coins; when he instantly came out with a joke, saying: 'Give his lordship the *Jewish* ones, but hand me the *Roman*.'

Having acquitted a man indicted for cow-stealing, O'Connell was visited that night by his client, who was considerably the worse for his potatoes. They were alone in O'Connell's lodgings, in Cork, and O'Connell had no desire for such companionship. He said he had so much to do, that he could dispense with the man's company.

'Well, counsellor, jewel, don't be angry with me; but before I give you my blessing, I want to give you an *advice*.'

'What is that?' asked O'Connell.

'When you go for to steal a cow, don't take any that are by the ditch—they're lean, hungry craturs; but take the outside one—she's shure to have the most mate.' So saying, the grateful client took his departure.

#### LINES ON GLENORMISTON.

[FRAGMENT OF A TWEEDSIDE PASTORAL.]

FRONTING the bold Cardrona Law,\*  
A fairer scene ne'er mortal saw;  
Along the haughs rolls silvery Tweed,  
And lambs are wandering o'er the mead;  
The yellow crops adorn the fields,  
Yon heath'ry brae rich honey yields;  
From high Lee Pen† the brattling burns  
Hurry in fancied sportive turns:  
The mossy banks where 'wild thyme grows,'  
With violets blue and blushing rose;  
Well shielded from the northern blast,  
While sunshine on the land is cast,  
A favouring clime for hill and plain  
Is glowing o'er this fair domain:  
Nature more prodigal than art,  
Performs, 'tis seen, a wondrous part;  
On trees the honeysuckle towers,  
And drapes in splendour laurel bowers;‡

\* Cardrona Law, a rounded massive hill, on the south side of the Tweed.

† The Lee Pen, though not the loftiest hill in Tweeddale, rises to a height of 1647 feet above the sea-level, and from its peaked summit there is an extensive view.

‡ Favoured by climate, the Portugal laurel (*Prunus Lusitanica*) grows here to a large size, and blossoms and fruits copiously at a height of 600 feet above sea-level, and is draped with the honeysuckle, which twines through its branches.

The blooming vetch\* festoons the pines,  
And on the yew the dog-rose shines:†  
The bosky glen, with fairy falls,  
O'er which the 'birds sing madrigals.'  
Here, robin long has held his court,  
Ne'er troubled in his old resort;  
And through the air at evening gloom,  
The tasselled limes shed sweet perfume;  
There we may note the roving bee,  
As squirrel darts from tree to tree;  
Disturbed by pet-dog's merry bounds,  
Shy cushat swiftly makes his rounds:  
More free from fear of deadly harm,  
The pheasant stalks without alarm—  
A golden gleam amidst the shade,  
Or in the path that art has made,  
And to the grove is beauty lent  
By bird, a moving ornament:  
The bridges span the sparkling rill,  
Yet stop not there, but climb the hill;  
Here, mountain ash with berries bright  
Gleams overhead, and crowns the height;  
When summit of the glen is found,  
We pause to glance on all around:  
The rustic hut, a cool retreat,  
When sun glares down with burning heat,  
While birch, and broom, and graceful fern,  
Are mirrored in the mimic tarn:  
The House embowered in elms and oaks,  
With lawn white speckled o'er with flocks;  
Those ancient elms a tale could tell,  
Of that famed flight o'er Minchmoor fell,  
When gallant GRAHAM, escaped from foes,  
Alighted here for brief repose.‡  
And where is now that feudal Tower,  
That sheltered GRAHAM in evil hour?  
Alas! 'tis gone, by boor effaced,§  
And near its site a mansion placed—  
A dwelling changed since these old days,  
But rife with song and Border lays;  
Away from crowds and maddening din,  
With peace without, and calm within,  
And solace drawn from lettered page,  
A joy so well befitting age—  
There woods spread out in varied green,  
And flowers arrayed in summer sheen,  
Make up a picture, beautiful, I ween.

\* The *Vicia cracca*, or tufted vetch, a beautiful climbing plant, with bluish purple flowers.

† When the wild-rose happens to be growing close to the hollow or yew, it ascends, insinuates itself among the branches, and projects its flowers to the surface; the effect being particularly beautiful, and worthy of attention in ornamental shrubbery.

‡ When the royal forces were routed at Philiphaugh, 13th September 1645, their unfortunate commander, JAMES GRAHAM, Marquis of Montrose, fled with a few followers across Minchmoor. Refused admittance at Traquair House, he, according to local tradition, alighted for a brief space at Ormiston Tower on his way westwards. The approach to the Tower was by a broad avenue of aged elms, a few of which still remain in front of Glenormiston House.

§ Ormiston Tower, one of the Border keeps along the Tweed, indicated in old maps, was ruthlessly destroyed early in the present century.

## AMERICAN ENGLISH.

It is said that, just after the Crimean War, when everything English was in particularly bad favour at St Petersburg, the Emperor Alexander, wishing to have some document presented to the American minister at his court, ordered it to be translated, not into English, but into the American language. Had his orders been literally obeyed, the document would have been of a rather more diverting character than usually belongs to diplomatic notes and memoranda. American English is assuredly one of the most singular of dialects. It is becoming yearly more and more the spoken, and, to a great extent, the written language of the country. It is English, with a strong infusion of new words, new idioms, and new forms of speech—some original, some borrowed from other languages, some mere slang, but dignified at times by a certain rough wit which is thoroughly racy of the soil.

American English flourishes in the ruder forms of Transatlantic life, though no class or order is quite exempt from it. It springs up in luxuriant growth in American journalism, to which, indeed, it owes some of its most striking expressions. It has been the subject of the learned researches of American *savants*, like Bartlett and Professor de Vere. It has a literature, too, of its own, the work of authors like Bret Harte, Mark Twain, and the immortal old showman, Artemus Ward; Major Bigelow and Colonel Hay, U. Donough Outis (that is, 'You don' know who 'tis') and Orpheus C. Kerr. But this literature has a good deal of the artificial about it, and we often find more satisfactory specimens of the 'American language' in the vigorous editorials, or, as we should call them, leaders, of the free press of the Great Republic.

The foreign elements of the dialect are derived from all the four quarters of the globe. In the western states, the Chinese immigrants are introducing stray words of their celestial language; in California and Texas, Spanish words abound; in the southern states, the negro has a corrupt English of his own, which has some influence in

changing the language even of the whites. From Louisiana come Anglicised French terms; in New England there is a Dutch element of variation; everywhere the Germans are at work, elaborating that singular German-American English with which Hans Breitmann has made us familiar; and, finally, the fast-disappearing Indians are leaving relics of their various languages imbedded, like fossils, in the daily speech of their conquerors. Besides such Indian names for animals as wapiti and caribou, moose and musquash, and well-known words like wigwam, wampum, and sachem, we meet now and then with Indian derivatives—such as *pocasun* and *pokeloken*, for marshy ground; *suckatah*, a dainty dish of green corn, beans, and venison, from the Indian *messicwatash*; and *hominy*, a kind of grain, from the Indian *ahuminea*, parched corn. It is said that even the familiar word 'Yankee' is of Indian origin, being nothing more than a corruption of *Yengees*, an early Indian attempt to pronounce the word 'English.'

Every reader of Bret Harte's Californian sketches must have noticed the great number of Spanish words which he uses as familiarly as if they were English; but, besides these, there are American words which are nothing but Spanish terms roughly cut down into an English form—such are *mustang*, a wild horse, which is the Spanish *mesteno*; and *stampede*, from *estampida*. Stampede means a rush, and the American tendency to make one or two verbs out of every substantive has produced such forms as 'they stampeded,' which means they ran off suddenly; or even 'they stampeded him'—that is to say, frightened him off. The Spanish imperative, *vamos*, let us go, has produced another word for rapid flight—to *vamos*.

The French word *levée*, accented on the last syllable, means, in America, as with us, a reception; but pronounced like *levy*, it means a raised embankment or wharf. Other French words have received worse treatment. The early French settlers in Missouri called one of their clearings *Bois Brulé*, the Burnt Wood; it now appears on the local maps as Bob Ruly. Similarly, we have Bodewash from *Bois de Vache*; and Smack Cover

from *Chemin Couvert*. Family names have been similarly treated; Peabody was once Pibaudière, and Bunker's Hill is named after the family of Bon Cœur. When a man receives promotion out of his turn, those who are passed over are said to be 'overslaughed,' from the Dutch *overslaan*, to skip. A Dutch word, too, is 'boss,' from *baas*, an overseer; and many others might be added. In the same way, too, the Germans have supplied a few words, but not very many, for they have not been so long in the country as the Spaniards, French, and Dutch.

The new meanings given to words produce a very singular effect on the English ear. A 'smile' is a drink; 'ugly' means not only repulsive, but wicked; a man who has been induced to buy an unsound horse is not cheated, but 'stuck with a bad horse.' 'To love' is to like, as in Bartlett's example: 'Do you love pumpkin-pie?' There are dozens of words used in the sense of 'very'; a very mean man is 'a monstrous mean fellow.' 'O doctor,' says an invalid, 'I'm powerful weak, but cruel easy.' In this way, powerful, cruel, monstrous, dreadful, awful, and mighty are synonymous, and this paradoxical phrase means only: 'I'm very weak, but feel no pain.'

American political life has given rise to an abundance of quaint phrases. Some are derived from the habits of animals: a party is said to *snake*, when it follows an underhand policy; if a politician proves false to his pledges, the papers announce that he has 'crawfished awfully,' an allusion to the retrograde motions of the crayfish. When a group of members supports a bill in which they have no direct interest, in order to secure the help of its promoters for a bill of their own, they are said to be 'log-rolling,' a term taken from the backwoods, where a man who has cut down a big tree gets his neighbours to help him in rolling it away, and in return helps them with their logs. To 'gas,' is to talk only for the purpose of prolonging a debate. A man who can be depended upon by his party is said to be 'sound on the goose.' On the other hand, a doubtful supporter is spoken of as 'weak in the knees.' Determination is backbone. 'Backbone,' says a leader in *The Republic of New York*, 'is the material that makes an upright man.' A party that always votes together is said to 'vote solid.' A party conference is a 'caucus,' its programme is a 'platform,' and these two words we may remark *en passant* are being too freely used in some quarters even among ourselves. A member of congress does not make a speech, he 'orates'; if he can embarrass his adversary, he rejoices at having 'cornered' him; if his speech is a good one, it is a 'rouser'; if it fails, it is a 'fizzle,' so called from the hiss of the priming in a gun that misses fire. Institution, originally a political word, has been given a very wide meaning; besides speaking of the 'institutions of the country,' American writers mention the buzzards of Charleston as one of the institutions of that city, and inform us that a taste for driving is one of the institutions of New York. Writing from China to the *New York Times*, Mr Seward described a typhoon as 'an eastern institution,' which, though doubtless entertaining as a topic for future narrative, is seldom amusing as an experience. Before we take leave of politics, we must notice one 'institution' of political life. Some men stand neutral at first in a debate or

an election, in order to join the winning side as soon as they see the first signs of victory. In America, these prudent individuals are said to be 'sitting on a fence,' or are called 'fencemen.'

Trade has even more cant words than politics. Money has forty or fifty different names; such singular terms as dye-stuffs, spondulics, shadescals, and charms, figuring in the list. Insolvent banks are called wild-cat banks, and their notes are wild-cats. The smallest cobbler's shop is a 'boot-store'; a draper's, is a 'dry-goods store'; and 'to run a store,' is to keep a shop. A figure of speech derived from the last expression is 'to run your face,' which means, to go upon credit. 'To make a pile,' is to make money; to be 'dead broke,' is to become bankrupt. These commercial phrases penetrate into every-day life. 'What's to pay?' means simply what's the matter? 'A drive in these hills *pays*,' says a writer in an American magazine; 'it is pure enjoyment.' Another Americanism, 'to be well posted up' in a subject, originally derived from the posting up of a ledger, has been adopted by some English writers. Similarly there are nautical words which are used on all possible occasions. Where an English railway guard calls out before starting his train, 'Take your places,' the American 'train-conductor' shouts, 'Get aboard, get aboard'; and then signals the driver to 'go ahead.' A pushing active man is said to be 'goaheaditive,' and from this adjective a barbarous substantive has in due course been developed; and on the declaration of war between France and Prussia in 1870, the *New York Times* strove to impress its readers with the fact that 'in this complication of European difficulties, a favourable opportunity was afforded to American goaheaditiveness.'

The American railways, or rather 'railroads,' have a complete terminology of their own. One starts not from a station, but from the 'depot' (pronounced dee-po); the carriage is a 'car'; the largest and best fitted of these are called 'palace cars'; and by a tremendous stretch of absurdity, some of the companies have built improved cattle wagons, and dubbed them 'Stock palace cars.' The carriages fitted with beds are called 'sleeping cars' or 'sleepers'; an express is a 'lightning train.' 'In front,' says the *New York Tribune*, describing a collision in 1871, 'was the Buffalo sleeper of the Chicago lightning train; it had twenty-seven passengers, and not a soul was saved.' The buffers are called 'bumpers'; the stoker and the driver are respectively the 'fireman and the engineer.' The line is the *track*; where it runs on a curve, it is a *bay*; where it runs straight, it is an air line, a bee line, or a straight shoot. 'To flag' means to signal; when two trains 'collide,' the newspapers report not a railway accident, but a 'railroad disaster'; and these disasters have given rise to a terrible word, to 'telescope'; and we hear how one 'train broke down, and the next coming up after it telescoped into the rear cars'; that is, ran into them as one tube of a telescope slides into the other.

There are various expressions derived from the habits and appearance of beasts, birds, fishes, and plants. It seems strange to attribute any particular happiness to a shell-fish, yet a man will say that he is as 'happy as a clam,' or 'as happy as a clam-fish at high-water.' To 'play possum' is to dissimulate, a reference to the cunning habits of

the opossum. The favourite haunt of the 'possum is among the thick leaves of the gum-tree, where he lies safely hidden from the sportsman; so 'to gum-tree' is to elude, to cheat, and this again is shortened into 'to gum,' as in the phrase, 'Now don't you try to gum me.'

All wild animals are spoken of as 'varmin' or 'varmint'; and an English traveller relates how, having inadvertently spoken of the opossum as a 'singular creature,' his hunter-guide remonstrated with him: 'A possum, sir, isn't a critter—it's a varmint; only cattle and tame animals being dignified with the name of 'critters.' For some animals there is a strange and vague nomenclature. In some of the states, a kind of pheasant is known as the partridge, in others the name is given to quails and grouse; the so-called 'turkey buzzard' is neither a turkey nor a buzzard, but a kind of vulture which acts as a scavenger in the cities of the southern states and of parts of South America, and enjoys in return various privileges and immunities. We have seen them stalking about the streets of Lima among the people, as tame as hens in a village street, or quietly sunning themselves on the house-tops.

Of a part with this love for exaggeration so characteristic of American humour, is the tendency for violent expressions which appears in American daily speech. A man is attacked and completely defeated in the legislature, and this is reported by saying that he has been 'catawampiously chewed up.' 'I don't want to swear,' says a conscientious man, 'cos it's wicked; but if I didn't see him do it, may I be teetotolaciously clawed up!' There are many expressions like the last, for the American seldom swears outright, but generally has recourse to those half-disguised phrases which a famous New York preacher once denounced as 'one-horse oaths.' New words are formed every day; when the American has seized upon an expressive word, he works it into half-a-dozen forms, and secures it a currency in two or three parts of speech. From the verbs to walk, to sing, &c., we get walkist, singist, shootist, and half-a-dozen others formed like pianist and linguist. Not satisfied with this last word, American sailors have lengthened it into 'linguister,' an interpreter. Then we have such words as 'to overture,' which means to propose; 'to donate' for to give a donation; and 'to eventuate' for to happen. To 'disremember' is to forget, and 'to out a candle' is to extinguish it. The love for abbreviation has produced such forms as 'to rail' for to travel by rail, and to 'cable' news, meaning to send a 'cable-gram,' or as we should say, a message by Atlantic cable. Many words have nothing to recommend them but a strange sound, as, for instance, 'splurge,' a noisy demonstration, whence the verb 'to splurge,' meaning to boast and swagger, and then the adjective 'splurging,' and the adverb 'splurgingly.' 'Merit always makes its way,' says a Transatlantic editor; 'sometimes quickly, often slowly, but *never splurgingly*—a remark in which we most heartily concur.

Then there is a host of idioms, such as, 'I kinder thought,' or 'I kind of thought,' meaning, 'I rather thought; 'nary tile,' or 'nary cent,' for 'no hat,' or 'not a cent.' 'To' is constantly used for 'at; 'company to supper to our house' means a 'teaparty at our house.' 'Done' is used instead of 'did,' and in the South, 'Do don't that' means

'Don't do it.' Some of these, such as 'nary,' 'kinder,' &c. are really the offspring of the universal tendency to abbreviate. Those words are of course spoken, and not written; but other equally objectionable abbreviations appear first in press telegrams and reports, and then gradually get into general circulation. Such are 'incendiariied,' for set on fire by an incendiary; 'burgled,' meaning robbed by burglars; 'interviewed,' and the like. Press writers are accountable, too, for 'Bayres' as a substitute for Buenos Ayres, and 'Frisco' for San Francisco. On the other hand, the tendency for 'tall-talk' in speeches and leaders, produces a series of grandiloquent names for states and cities, which, we presume, are taken as some compensation for clipped names, like Frisco and Bayres. The state of New York is the Empire State, or the Excelsior State. New York itself is the Empire City; Pennsylvania is the Keystone State; Missouri, the Bullion State; Virginia is the Old Dominion; and New Hampshire, the Granite State. Baltimore is popularly known as the Monumental City; Cincinnati is the Queen City; and Buffalo, the Queen City of the Lakes. New Orleans is the Crescent City; Boston, the Classic City; San Francisco, the Golden City; while Duluth, on Lake Superior, rejoices in the rather 'tall' title of the Zenith City of the Unsalted Seas, a name which savours strongly of pantomime play-bills. In other names there is an air of good-humoured fun and banter. Mississippi is known as the Mudcat State, and its people are Mudcats, a name derived from the great number of cat-fish which live in their swamps and rivers; Rhode Island, the smallest of all the states, is known as Little Rhody; and Washington itself is spoken of as the City of Magnificent Distances, for, the city having been planned on a splendid scale, and never completed, its churches, public buildings, and mansions stand far apart, and often in the midst of waste grounds or miserable shanties.

It must, however, be remembered that all American English is not mere slang, or an accumulation of newly coined words. There are many words current in America which seem strange and uncouth to our ears, but still are real old English words, preserved in the United States, but obsolete in the Old Country, and found only in writers of the sixteenth and seventeenth centuries, or in our provincial dialects. 'I guess' looks very like a genuine Americanism, yet Chaucer and Spenser use it with only a very slight difference of meaning:

Her yellow hair was braided in a tress  
Behind her back, a yard long, I guess,

says Chaucer; and

Amylia will be loved as I mote ghesse,

is a line from the *Fuery Queen*. 'He whose design it is to excel in poetry,' says Locke, 'would not, I guess, think that the way if it was to make his first essay in Latin verse.' The word 'guess' gives this sentence quite an American sound, yet it is from a standard English author.

Altogether, the subject of American English is one which would probably repay serious study on the part of European, and, above all, English philologists. It would give us an insight into the variations of language; the modifications of sense,

and sound, and meaning; the blending of the old and new; of words formed from various sources, and borrowed from many lands, by which, at length, a new dialect, and even a new language, is slowly built up. We see, indeed, in America, processes at work in modifying speech not unlike some of those which helped to change Anglo-Saxon into English centuries ago. But we should be sorry to see the study of American English leading to the further introduction and adoption of Americanisms amongst ourselves. Popular American literature has given us too many of these already; we enjoy quite enough freedom on this side of the Atlantic without chopping and changing our fine old language in the 'free-and-easy' style that is so popular with our friends upon the other.

## THE FLAG OF DISTRESS.

### CHAPTER XXI.—FIGHTING THE TIGER.

At sight of De Lara and Calderon, the young officers stand speechless, as if suddenly struck dumb; for a pang has shot through their hearts, bitter as a poisoned shaft. Crozier feels it the keenest, since it is an affair that most concerns him. The suitor of Carmen Montijo a 'sport'—a common gambler! Favoured, or not, still an aspirant to her hand; though it were chagrin enough to think of such a man being even on terms of acquaintance with her. Cadwallader is less affected, though he too feels it. For although Calderon is in the circle of outside players—apparently a simple wagerer, like the rest—the companionship of the morning, with the relations existing between the two men, tell of their being socially the same. He already knows his rival to be a blackguard; in all likelihood, he is also a blackleg.

Quick as thought itself, these reflections pass through the minds of the English officers; though for some time neither says a word—their looks alone communicating to each other what both bitterly feel. Fortunately, their surprise is not noticed by the players around the table. Each is engrossed in his own play, and gives but a glance at the newcomers, whose naval uniforms are not the only ones there. But there are two who take note of them in a more particular manner: these, Faustino Calderon, and Francisco de Lara. Calderon, looking along the table—for he is on that same side—regards them with glances, furtive, almost timid. Very different is the manner of De Lara. At sight of Crozier he suspends the deal, his face suddenly turning pale, while a spark of angry light flashes forth from his eyes. The passionate display is to all appearance unobserved; or, if so, it is attributed to some trifling cause, as annoyance at the game going against him. It is almost instantly over; and the disturbed features of the Monté dealer resume their habitual expression of stern placidity.

The young officers having recovered from their first shock of astonishment, also have restored to them the faculty of speech; and now exchange thoughts, though not about that which so disturbs them. By a sort of tacit understanding it is left to another time, Crozier only saying: 'We'll talk of it, when we get aboard ship. That's the place for sailors to take counsel together, with a clear head, such as we want. At this precious minute, I feel like a fish out of water.'

'By Jove! so do I.'

'The thing we're both thinking of has raised the devil in me. But let us not bother about it now. I've got something else in my mind. I'm half-mad, and intend *fighting the tiger*.'

'Fighting the tiger! What do you mean by that, Ned?'

'You'll soon see. But if you insist upon it, I'll give you a little preliminary explanation.'

'Yes, do. Perhaps I can help you.'

'No, you can't. There's only one who can.'

'Who is he?'

'It's not a he, but a she: the Goddess of Fortune. I intend soliciting her favours; if she but grant them, I'll smash Mr De Lara's Monté bank.'

'Impossible! There's no probability of your being able to do that.'

'Not much probability, I admit. Still there's a possibility. I've seen such a thing done before now. Bold play, and big luck, combined will do it. I'm in for the first; whether I have the last, remains to be seen. In any case, I'll either break the bank, or lose all I've got on me—which by chance is a pretty big stake to begin with. So here goes!'

Up to this time their conversation has been carried on in a low tone; no one hearing, or caring to listen to it, all being too much absorbed in their own calculations, to take heed of the bets, or combinations of others. If any one gives a glance at them, and sees them engaged in their *sotto-voce* dialogue, it is but to suppose they are discussing which card they had best bet upon—whether the *Soto* or *Caballo*; and whether it would be prudent to risk a whole dollar, or limit their lay to the more modest sum of fifty cents. They who may have been thus conjecturing, with everybody else, are taken by surprise, in fact, somewhat startled, when the older of the two officers, bending across the table, tosses a hundred pound Bank of England note upon the baize, with as much nonchalance as if it were but a five-dollar bill!

'Shall I give you cheques for it?' asks the croupier, after examining the crisp note—current over all the earth—and knowing it good as gold.

'No,' answers Crozier; 'not yet. You can give that after the bet's decided—if I win it. If not, you can take the note. I place it on the Queen, against the Knave.'

The croupier, simply nodding assent, places the note on the Queen.

During the interregnum in which this little incident occurs, the English officers, hitherto scarce noticed, are broadly stared at, and closely scrutinised—Crozier becoming the cynosure of every eye. He stands it with a placid tranquillity, which shews him as careless about what they may think him, as he is of his cash. Meanwhile, the cards have had a fresh shuffle, and the deal begins anew; all eyes again turning upon the game, in earnest expectancy; those who, like Crozier, have placed upon the Queen, wishing her to shew her face first. And she does.

'*Cubullo en la puerta mozo!*' (The Queen in the door wins) cries the dealer, the words drawled out with evident reluctance, while a flash of fierce anger is seen scintillating in his eyes.

'Will you take it in cheques?' asks the croupier, addressing himself to Crozier, after settling the smaller bets. 'Or shall I pay you in specie?'

'You needn't pay yet. Let the note lie. Only

cover it with a like amount. I go it double, and again upon the Queen.'

Stakes are relaid—some changed—others left standing or doubled, as Crozier's, which is now a bet for two hundred pounds. On goes the game, the pieces of smooth pasteboard slipping silently from the jewelled fingers of the dealer, whose eye is bent upon the cards, as if he saw through them—or would, if he could. Whatever his wish, he has no power to change the chances. If he have any professional tricks, there is no opportunity for him to practise them. There are too many eyes looking on; too many pistols and bowie-knives around; too many men ready to stop any attempt at cheating, and punish it, if attempted.

Again he is compelled to call out: '*Caballo en la puerta mozo!*'

'Now, sir,' says the croupier to Crozier, after settling other scores; 'you want your money, I suppose?'

'Not yet. I'm not pressed, and I can afford to wait a little longer. I again go double, and am still contented with my Queen.'

The dealing proceeds; with four hundred pounds lying on the *Caballo* to Crozier's account—and ten times as much belonging to other betters. For now that the luck seems to be running with the English officer, most lay their stakes beside his.

Once again: '*Caballo en la puerta mozo!*' And again Crozier declines to take up his bet.

He has now sixteen hundred pounds sterling upon the card; while the others, thoroughly assured that his luck is on the run, double theirs, till the bets against the bank run up to many thousands.

De Lara begins to look anxious, and not a little down-hearted. Still more anxious, and lower in heart, appears one seated on the opposite side—Calderon; for it is his money that is moving away from him. On the contrary, Crozier is as cool as ever, his features set in a rigid determination to do what he promised—break the bank, or lose all he has got about him. The last, not likely yet, for soon again comes the cry: '*The Queen winner!*'

There is a pause longer than usual, for the settling of such a large score; and after it an interval of inaction. The dealer seems inclined to discontinue; for still lying upon the Queen is Crozier's stake, once more doubled, and now counting three thousand two hundred pounds! Asked if he intends to let it remain, he replies sneeringly: 'Of course I do; I insist upon it. And once more I go for the Queen. Let those who like the Knave better, back him!'

'Go on! Go on!' is the cry around the table, from many voices speaking in tone of demand.

De Lara glances at Calderon furtively, but, to those observing it, with a look of interrogation. Whatever the sign, or answer, it decides him to go on dealing. The bets are again made; to his dismay, almost everybody laying upon the Queen, and, as before, increasing their stakes. And in like proportion is heightened the interest in the game. It is too intense for any display of noisy excitement now. And there is less throughout the saloon: for many from the other tables, as all the saunterers, have collected around, and standing several deep, gaze over one another's shoulders with as much eager earnestness as if a man were expiring in their midst.

The ominous call at length comes—not in clear voice, or tone exultant, but feeble, and as if rung reluctantly from the lips of the Monté dealer; for it is again a verdict adverse to the bank: '*Caballo en la puerta mozo!*'

As De Lara utters the words, he dashes the cards down, scattering them all over the table. Then rising excitedly from his chair, adds in faltering tone: 'Gentlemen, I'm sorry to tell you—the bank's broke!'

#### CHAPTER XXII.—A PLUCKY 'SPORT.'

'*The bank's broke!*'

Three words that have oft—too oft—startled the ear, and made woe in many a heart.

At hearing them, the gamblers of the El Dorado seated around the Monté table spring to their feet, as if their chairs had suddenly become converted into iron at a white-heat. They rise simultaneously, as though all were united in a chain, elbow and elbow together. But while thus gesturing alike, very different is the expression upon their faces. Some simply shew surprise; others look incredulous; while not a few give evidence of anger. For an instant there is silence—the surprise, the incredulity, the anger, having suspended speech. This throughout the saloon, for all, bar-drinkers as well as gamblers, have caught the last three words spoken by De Lara, and thoroughly understand their import. No longer is heard the clink of ivory cheques, or the metallic ring of doubloons and dollars. No longer the thudding down of decanters, nor the jingle of glasses. Instead, a stillness so profound, that one entering at this moment might fancy it a Quakers' meeting, but for the symbols seen around—these, anything but Quakerish. Easier to conceive it a grand gambling-hell represented in wax-work.

The silence is of the shortest—as also the immobility of the figures composing the different groups; only for a half-score seconds. Then there is noise enough, with no end of gesticulation. A roar arises that resounds through the room; while men rush about wildly, madly, as if in the courtyard of a lunatic asylum. Some shew anger—those who are losers by the breaking of the bank. Many have won large bets; the stakes still lying on the table, which they know will not be paid. The croupier has told them so; confessing his cash-box cleared out at the last settlement; even this having been effected with the now useless ivory cheques.

Some gather up their gold or silver, and stow it in safety; growling, but satisfied that things are no worse. Others are not so lenient. They do not believe there is good cause for the suspension, and insist upon being paid in full. They rail at the proprietor of the bank, adding menace. De Lara is the man thus marked. They see him before them, grandly dressed, glittering with diamonds. They talk of stripping him of his *bijouterie*.

'No, gentlemen!' he protests, with a sardonic sneer. 'Not that, if you please—not yet. First hear me; and then 't will be time for you to strike.'

'What have you to say?' demands one, with his fists full of ivory counters—the protested cheques.

'Only that I'm not the owner of this bank—and never have been.'

'Who is, then?' ask several at the same time.

'Well; that I can't tell you just now. And what's more, I won't. No; that I won't!'

The gambler says this with emphasis, and an air of sullen determination, that has its effect upon his questioners—even the most importunate. For a time, it stays their talk, as well as action. Seeing this, he follows it up with further speech, but more conciliatory. 'As I've said, gentlemen, I'm not the owner of this concern; only the dealer of the cards. You ask, who's proprietor of the smashed table. It's natural enough you should want to know. But it's just as natural, that it ain't my business to tell you. If I did, it would be a shabby trick; and, I take it, you're all men enough to see it in that light. If there's any who isn't, he can have my card, and call upon me at his convenience. My name's Francisco de Lara—or Frank Lara, if you like, for short. I can be found here, or anywhere else in San Francisco, at such time as may suit anxious inquirers. And if any wants me now, and can't wait, I'm good this minute for pistols across the table. Yes, gentlemen! Any of you who'd like a little amusement of that kind, let him come on! It'll be a change from the Monté. For my part, I'm tired of shuffling cards; and would like to rest my fingers on a trigger. Which of you feels disposed to give me the chance? Don't all speak at once!'

No one feels disposed, and no one speaks. At least in hostile tone, or to take up the challenge. Instead, half a score surround the 'sport,' and not only express their admiration of his pluck, but challenge him to an encounter of drinks, not pistols. Turning towards the bar, they vociferate: 'Champagne!'

Contented with the turn things have taken, and proud at the volley of invitations, De Lara accepts; and soon the vintage of France is seen effervescing from a dozen tall glasses, and the Monté dealer stands drinking in the midst of his admirers. Other groups draw up to the bar-counter; while twos and solitary tipplers fill the spaces between. The Temple of Fortuna is for a time deserted; her worshippers transferring their devotion to the shrine of Bacchus. The losers drink to drown disappointment, while the winners quaff cups in the exhilaration of success. If a bad night for the bank, it is a good one for the bar. Decanters are quickly emptied, and bottles of many kinds go 'down among the dead men.'

The excitement in the saloon is soon over. Occurrences of like kind—often of more tragical termination—are too common in California to cause any long-sustained interest. Within the hour will arise some new event, equally stirring—leaving the old to live only in the recollection of those who have been active participants in it. So with the breaking of Frank Lara's bank. A stranger, entering the saloon an hour after, from what he there sees, cannot tell that an incident of so serious nature has occurred; for in less than this time the same Monté table is again surrounded by gamblers, as if its play had never been suspended. The only difference observable is, that quite another individual presides over it, dealing out the cards; while a new croupier has replaced him whose cash receipts so suddenly ran short of his needed disbursements. The explanation is

simply, that there has been a change of owners; another celebrated 'sport' taking up the abandoned bank, and opening it anew. With a few exceptions, the customers are the same; their number not sensibly diminished. Most of the old players have returned to it; while the places of those who have defected, and gone off to other gambling resorts, are filled by fresh arrivals. A small number, who think they have had play enough for that night, have left the El Dorado for good. Among these are the English officers, whose visit proved so prejudicial to the interests of the place. De Lara, too, and Calderon, with other confederates, have forsaken the saloon. But whither gone, no one knows, or seems to care; for the fortunes of a fallen man soon cease to interest men, who are themselves madly struggling to mount up.

#### CHAPTER XXIII.—A SUPPER CARTE-BLANCHE.

On parting from the El Dorado, Crozier and Cadwallader do not go directly aboard the *Crusader*. They know that their boat will be awaiting them at the place appointed. But the appointment is for a later hour, and as the breaking of the Monté bank, with the incidents attendant, occupied but a short half-hour, there will be time for them to see a little more of San Franciscan life—perhaps the last chance they may have during their stay in the port. They have fallen in with several other young officers, naval like themselves, though not of their own ship, nor yet their own navy, or nation; but belonging to one, cognate and kindred—Americans. Through the freemasonry of their common profession, with these they have fraternised; and it is agreed they shall all sup together. Crozier has invited the Americans to a repast the most *recherché*, as it is the costliest, that can be obtained at the grandest hotel in San Francisco, the *Parker House*. He adds humorously, that he is able to stand the treat. And well he may; since, besides the English money with which he entered the El Dorado, he has brought thousands of dollars out of it, which would have been more had all the ivory cheques been honoured. As it is, his pockets are filled with notes and gold; as also those of Cadwallader, who helps him to carry the coin. Part of the heavy metal he has been able to change into the more portable form of bank-notes. Yet the two are still heavily weighted—'laden like hucksters' donkeys!' jokingly remarks Cadwallader, as they proceed towards the *Parker*.

A private room is engaged; and, according to promise, Crozier bespeaks a repast of the most sumptuous kind, with *carte-blanche* for the best wines—champagne at three guineas a bottle, hock the same, and South-side Madeira still more. What difference to him? The supper ordered in the double-quick, soon makes its appearance. Sooner in San Francisco than in any other city of the world; in better style, too, and better worth the money; for the Golden City excels in the science of gastronomy. Even then, amidst her canvas sheds, and weather-boarded houses, could be obtained dishes of every kind known to Christendom, or Pagandom: the *cuisine* of France, Spain, and Italy; the roast beef of Old England, as the pork and beans of the New; the *gumbo* of Guinea, and *sauerkraut* of Germany, side by side with the swallow's-nest soup and sea-slugs of China. Had

Lucullus but lived in these days, he would have forsaken the banks of the Tiber, and made California his home.

The repast furnished by the *Parker House*, however splendid, has to be speedily despatched; for unfortunately time forbids the leisurely enjoyment of the viands, to a certain extent marring the pleasure of the occasion. All the officers, American, as English, have to be on their respective ships at the stroke of twelve. Reluctantly breaking up their hilarious company, they prepare to depart. They have forsaken the supper-room, and passed on to the outer saloon of the hotel; like all such, furnished with a drinking-bar. Before separating, and while buttoning up against the chill night-air, Crozier calls out: 'Come, gentlemen; one more glass! The stirrup-cup!'

In San Francisco this is always the wind-up to a night of revelry. No matter how much wine has been quaffed, the carousal is not deemed complete without a last 'statutory' drink taken standing at the bar. Giving way to the Californian custom, the officers range themselves along the marble slab; bending over which, the polite bar-keeper asks: 'What is it to be, gentlemen?'

There is a moment of hesitation, the gentlemen—already well wined—scarcely know what to call for. Crozier cuts the Gordian-knot by proposing: 'A round of punches à la Romaine!'

Universal assent to this delectable drink; as all know, just the thing for a night-cap. Soon the cooling beverage, compounded with snow from the Sierra Nevada, appears upon the counter, in huge glasses, piled high with the sparkling crystals—a spoon surmounting each; for punch à la Romaine is not to be drunk, but eaten. Shovelling it down in haste, adieus are exchanged by a hearty shaking of hands, when the American officers go off, leaving Crozier and Cadwallader in the saloon. These only stay to settle the account.

While standing by the bar, waiting for it to be brought, they cast a glance around the room. At first careless, it soon becomes concentrated on a group seen at some distance off, near one of the doors leading out, of which there are several. There are also several other groups; for the saloon is of large dimensions, besides being the most popular place of resort in San Francisco. And for San Francisco the hour is not yet late. Along the line of the drinking-bar, and over the white-sanded floor, are some scores of people of all qualities and kinds, in almost every variety of costume. They who compose the party that has attracted the attention of the English officers shew nothing particular—that is, to the eye of one unacquainted with them. There are four of them, two wearing broadcloth cloaks, the other two having their shoulders shrouded under serapes. Nothing in all that. The night is cold, indeed wet, and they are close to the door, to all appearance intending soon to step out. They have only paused to exchange a parting word, as if they designed to separate before issuing into the street.

Though the spot where they stand is in shadow—a folding screen separating it from the rest of the saloon—and it is not easy to get sight of their faces—the difficulty increased by broad-brimmed hats set slouchingly on their heads, with their cloaks and serapes drawn up around their throats—Crozier and Cadwallader have not only seen, but recognised them. A glance at their countenances,

caught before the muffling was made, enabled the young officers to identify three of them as De Lara, Calderon, and the *ci-devant* croupier of the Monté bank. The fourth, whose face they have also seen, is a personage not known to them; but, judging by his features, a suitable associate for the other three. Soon as catching sight of them, which he is the first to do, Crozier whispers to his companion: 'See, Will! Look yonder! Our friends from the El Dorado!'

'By Jove! them, sure enough. Do you think they're following us?'

'I shouldn't wonder. I was only surprised they didn't do something when they had us in their gambling den. After the heavy draw I made on Mr Lara's bank, I expected no less than that he'd try to renew his acquaintance with me; all the more from his having been so free of it in the morning. Instead, he and his friend seem to have studiously avoided coming near us—not even casting a look in our direction. That rather puzzles me.'

'It needn't. After what you gave him, I should think he'll feel shy of another encounter.'

'No; that's not it. Blackleg though the fellow be, he's got game in him. He gave proof of it in the El Dorado, defying and backing everybody out. It was an exhibition of real courage, Will; and, to tell the truth, I couldn't help admiring it—can't now. When I saw him presiding over a gambling-table, and dealing out the cards, I at once made up my mind that it would never do to meet him—even if he challenged me. Now, I've decided differently; and if he call me out, I'll give him a chance to recover a little of his lost reputation. I will, upon my honour.'

'But why should you! A "sport," a professional gambler! The thing would be simply ridiculous.'

'Nothing of the kind—not here in California. On the contrary, I should cut a more ridiculous figure by refusing him satisfaction. It remains to be seen whether he'll seek it according to the correct code.'

'That he won't; at least, I don't think he will. From the way the four have got their heads together, it looks as if they meant mischief now. They may have been watching their opportunity—to get us two alone. What a pity we didn't see them before our friends went off. They're good fellows, those Yankee officers, and would have stood by us.'

'No doubt they would. But it's too late now. They're beyond hailing distance, and we must take care of ourselves. Get your dirk ready, Will, and have your hand close to the butt of one of Mr De Lara's shooting-irons.'

'I have it that way. Never fear. Wouldn't it be a good joke if I have to give the fellow a pill out of one of his own pistols?'

'No joking matter to us, if they're meditating an attack. Though we disarmed him in the morning, he'll be freshly provided, and with weapons in plenty. I'll warrant each of the four has a battery concealed under his cloak. They appear as if they're concocting some scheme, which we'll soon know all about—likely before leaving the room. Certainly, they're up to something.'

'Four hundred and ninety dollars, gentlemen!'

The financial statement is made by the bar-keeper presenting the bill.

'There!' cries Crozier, flinging down a five hundred dollar bill. 'Let that settle it. You can keep the change for yourself.'

'Thank ye,' drily responds the Californian dispenser of drinks, taking the ten dollar tip with less show of gratitude than a London waiter would give for a fourpenny piece—little as that may be.

Turning to take departure, the young officers again look across the saloon, to learn how the hostile party has disposed itself. To their surprise, the gamblers are gone; having disappeared while the account was being receipted.

'I don't like the look of it,' says Crozier, in a whisper. 'Less now than ever. No doubt we'll find them outside. Well; we can't stay here all night. If they attack us, we must do our best. Take a firm grip of your pistol, with your finger close to the trigger; and if any of them shews sign of shooting, see that you fire first. Follow me; and keep close!'

On the instant of delivering these injunctions, Crozier starts towards the door, his companion following, as directed. Both sally out, and for a while stand gazing around them. People they see in numbers, some lounging by the hotel porch, others passing along the street. But none in cloaks, or *serapes*. The gamblers must have gone clear away.

'After all, we may have been wronging them,' remarks Crozier, as in his nature, giving way to a generous impulse. 'I can hardly think that a fellow who's shewn such courage would play the assassin. Maybe they were but putting their heads together about challenging us? If that's it, we may expect to hear from them in the morning. It looks all right. Anyhow, we can't stay dallying here. If we're not aboard by eight bells, old Bracebridge'll masthead us. Let's heave along, my hearty!'

So saying, the senior officer leads off, Cadwalader close on his quarter—both a little unsteady in their steps, partly from being loaded with the spoils of El Dorado, and partly from the effects of the *Parker House* wines, and punches à la *Romaine*.

#### A SIXTEENTH-CENTURY 'CLAIMANT.'

THE quiet little town of Agen, in the south of France, is known to fame as having been the residence for many years of one of the most renowned scholars of the sixteenth century. In the spring of 1525 A.D., Antoine de la Rovère, who had been appointed by the pope Bishop of Agen, was accompanied to his new diocese by an Italian physician of Verona, one Julius Cæsar de l'Esclle de Bordonis by name. He had consented to attend his patron on the journey, on the understanding that, if he should be required to remain at Agen at all, his stay should be limited to eight days. The physician was a man of mature age, grave and dignified of mien, much given to study, of an almost stoical reserve and composure, and apparently far removed above the reach of earthly passion and caprice of fancy; yet, before that eight days' term was ended, the middle-aged physician had fallen hopelessly in love with a mere child, younger even than that celebrated lady of his native Verona whose passionate tenderness at an early age Shakspeare has commemorated. At the end of three years, for which interval the prudent parents had stipulated, the scholar of seven-and-

forty became the husband of this girl of sixteen. We may be sure 'all the neighbours' violently disapproved of the match, and prophesied domestic pokers, and an appeal to the Sir Crosswell Crosswell of the period, as the natural and inevitable sequel. They were wrong, we are charmed to say (all well constituted minds rejoice, as Confucius remarks, when the gossips of a neighbourhood are discomfited). The beautiful Andiette made a faithful and loving wife to her elderly spouse, who came afterwards to be known in the history of letters as *Prince Julius Cæsar Scaliger*.

Now, this little bit of romance in the life of one whose pursuits are to common thinking associated with what is dry and dreary in human life and character, with the absence of those more moving incidents and profounder passions which give to existence its colour, flavour, and variety, makes the biography of Scaliger a trifle more piquant than that of most who content themselves with the even tenor of a scholar's way, and such renown as attends it. Perhaps, however, both the romance and the renown would be insufficient to engage the reader's attention, if Scaliger had had any real right to the title which he assumed, and which we have emphasised by italics. Interested as we ourselves are in both the man and the scholar, we are forced to confess that for the general public the main point of interest in his career is, that he had no such right. Made famous for all time by his genius and learning, he is equally infamous by reason of an imposture which was not detected till after his death, when it made noise enough in the world of letters. In a word he was a *claimant* (to use a word which will be well understood in its new and special signification). The story will bear telling anew, partly because it has a fresh interest just now, and partly because the versions best known to English readers are inadequate and confused.

It is not usual to begin a biographical sketch with the middle age of its subject, but there are reasons in this case for taking that eccentric course. Up to the date of his marriage, Scaliger had published nothing; but he then betook himself to literature, which was in those days the arena of fighting as fierce as any that had been going on in Venetia between the imperial troops and that 'thunderbolt of Italy,' Gaston de Foix. Then, if you did not charge an adversary who differed from you in opinion about the signification of a particle, or the order of the Attic months, with parricide and blasphemy at least, you were held guilty of mean-spirited tenderness and an unworthy scrupulosity—of the same sort of crime, in fact, as a naval officer would be accused of under the articles of war, if he had failed to 'sink, burn, or destroy' the enemy's ships. For warfare of this rough kind Scaliger was just suited. Nature had given him a vigorous understanding, great courage and self-reliance, unequalled arrogance, and an insolence which has never been surpassed. Moreover, he was thoroughly well armed and equipped for the fray: his mind was stored with all the learning of his time; he was a highly trained and skilful logician; he wrote Latin like a Roman; and was master of all the arts of controversy and all the resources of abuse. Erasmus, the great master of argumentative satire, who, as the monks were wont to say, 'laid the egg which Luther hatched'—Erasmus, and the less known Jerome

Cardan, a real scholar and great physician, though he was more than half quack, astrologer, and juggler with the prophetic cards, were then the acknowledged heads of the republic of letters. Scorning meaner antagonists, Scaliger entered the lists against them both, and claimed credit for unseating the latter at the first splintering of lances. When a rumour of Cardan's death reached him, he modestly avowed his belief that the catastrophe had been brought about by mortification under defeat, and expressed his regret for having been the means of depriving the world of a life so valuable. Whether victorious or not in his controversy with Cardan, Scaliger had exhibited enough of learning and ability to win for himself at once a great and formidable reputation. Henceforward he divided the attention and shared the supremacy of the world of letters with his two great rivals.

He now turned his attention to poetical composition, Latin of course—though by this time Petrarch had 'unlocked his soul' in the vernacular—and was held by his contemporaries to have achieved an amount of success curiously out of proportion to that which modern criticism would assign to him. Originality and poetic feeling were not at all the characteristics of his muse; and in his criticisms he shews a singular want of appreciation of such qualities in others. In his *Poetics*—by his contemporaries considered his masterpiece—he avows a preference for the tragedies of Seneca over those of Æschylus and Sophocles; he ranks the Satires of Juvenal above those of Horace; he attributes more of creative imagination to Virgil than to Homer; and, to cap all, can 'see nothing to admire in the poetry of Catullus!' We see Scaliger to infinitely more advantage in his Commentaries on the botanical writings of Aristotle and Theophrastus. Scaliger had the merit of being the first to perceive and point out the value of Theophrastus's discoveries. He made, too, one happy guess on his own account, which might with better luck have ranked him among scientific botanists. He was the first to recommend the classification of plants according to their forms and distinguishing peculiarities of structure, instead of their official properties, which had been fastened upon for the purpose by previous systematists. The idea long slumbered, till in our own days it was revived and applied by Jussieu and De Candolle, whom Scaliger may thus be said to have in some degree anticipated. It is, however, as a scholar pure and simple that Scaliger is best known and most usually described. The esteem in which he was held by his contemporaries, in this respect, verged on the superstitious. One of them, Justus Lipsius, who possessed almost as much learning, and far more original talent, ranks him with Homer, Hippocrates, and Aristotle, giving a slight preference to Scaliger over any one of the others. Even in our own days he has found in Sir William Hamilton of Edinburgh—a somewhat kindred spirit, and more than rival—a eulogist quite as enthusiastic. 'The writings of no philosopher,' he says, 'since the days of Aristotle are better worthy of intelligent study.' Scaliger died in 1558, at the age of seventy-five or thereabouts; and his epitaph, written by himself, was, *Julii Cesaris Scaligeri quod fuit*.

During his lifetime no one seems to have called in question his claims to princely rank, though

they rested solely on his own assertion. In one of his letters, a portion of which we shall subsequently quote, he alludes to the matter as one about which there could possibly be neither doubt nor dispute. But Julius Cesar had a son, Joseph Justus, a scholar of even greater eminence than the father, styled by his contemporaries 'the Ocean of Knowledge,' sometimes the '*chef-d'œuvre* of Creation.' Moved by one of those impulses of vanity from which even great scholars are not wholly free, Joseph had the extreme ill-luck to publish a letter, *De Vetustate et Splendore Gentis Scaligerance*. It was addressed to Jan Douza, the scholar-soldier and soldier-scholar, who was Dutch ambassador to the court of Queen Elizabeth in 1572; and it was his father's high birth and splendid achievements, not his real and undoubted merits as a scholar and philosopher, that he chose to magnify.

The account which he gives, derived presumably from his sire, we will briefly summarise. Julius Cesar Scaliger was descended from the Della Scala family, whose sepulchral monuments in the form of pyramids surmounted by equestrian statues, are still shewn to the traveller at Verona, of which city they were anciently princes. His father was Benedetto della Scala, a general in the employment of Matthias Corvinus, king of Hungary; and his first preceptor was the well-known Fra Giacombo.

At twelve, like other young nobles, he became a page at the court of the Emperor Maximilian, in whose army he afterwards took service. Having lost his father and brother at the battle of Ravenna, in a fit of religious despondency he turned monk. But disgusted by the tediously minute observances of the Franciscans, in which very rigid order he had enrolled himself, his thoughts turned once more to a military career. This time he joined the banners of Maximilian's enemy, the king of France, and served with distinction till disqualified for active pursuits by gout. He now studied medicine, which we found him practising at Agen in 1525; his history subsequently to this date has been given, and is authentic.

Such was the story recounted by Joseph Justus in all good faith, but in an evil hour; for Joseph had enemies who did not lose much time in challenging his statements. He was a Protestant, detested of the Jesuits, partly because he was a renegade, and yet more because his scholarly renown reflected credit upon the Protestant university of Leyden, in which he was a professor. Now, one of the most noted scholars of that day was Scioppius (Latin for Schoppe), who in the next generation made the third, Lipsius and Casaubon being the other members, in that second literary triumvirate which succeeded to the one which the elder Scaliger had shared with Erasmus and Cardan. Scioppius had exactly reversed the process through which Joseph Scaliger had passed; from having been a Protestant he had become a Catholic. Upon this transformation, J. J. S. had made some clumsy jests, characterised by the ferocious taste of the period. The Jesuits instantly saw their opportunity; they formed the hope of finding in Scioppius—a controversialist as able as he was unscrupulous—a most valuable ally; and took care that the latter should be informed of J. J.'s elephantine attempts at humorous sarcasm. Straightway he turned upon his adversary with

all the fury of personal and religious hatred. Not satisfied with accusing him of atheism and debauchery, he charged him with having stolen the very name he bore!

It was the name *de Bordon*, borne by Scaliger when he first settled at Agen, that formed the peg on which Scioppius hung this extraordinary accusation. This name had recently been revived by Giraldi, in a history of the poets of the time, in which the elder Scaliger is mentioned as *J. C. de Burdon*, or *Burdonius*. Joseph Justus had explained that his father had assumed this name in order to distinguish himself from his brother Titus, slain at Ravenna, and that it was derived from an estate in the Venetian territory which had belonged to an uncle. But Scioppius and his Jesuit allies had got hold of a very different explanation. Either by accident, or by some marvellous piece of divination which the Protestants of that period were not slow to refer to the author of all mischief, they had found out that there had been residing at Verona, within the recollection of most of the inhabitants, a family of the name of *de Burdon*, whose original founders had been schoolmasters, barbers, *bric-a-brac* sellers, and what not. Now, what if these Scaliger de Burdons, father and son, these boasted descendants of the ancient princes of Verona, could be shewn to be members of the family of the *bric-a-brac* de Burdons? There was ecstacy in the thought. What a triumph for the church! What an overthrow for Scioppius' heretical enemy and rival! So, setting to work with malignant ingenuity, they gathered in a whole harvest of information from Verona, Padua, Venice, and elsewhere. They brought evidence to shew that Benedick Burdon, having been obliged to close his school at Verona, had retired to Padua; from Padua, he had migrated to Venice, and had there opened a *bric-a-brac* shop near the stairs (*la scala*) of St Mark. These stairs he subsequently had painted upon his sign-board, and finally assumed the name of *Benedetto della Scala*. His son, Julius Cæsar, having shewn some talent as a barber-surgeon, had been sent to Padua at the expense of an uncle, Boniface de Burdon, to study medicine there. Finding it difficult to get his living by bleeding and physicking people, he had turned monk, then soldier; then, after various vicissitudes, had come to France, as narrated, where he had taken cure to be known by the appellation of Della Scala only (as though he were connected with the illustrious Veronese family of that name), and afterwards, when he began to publish, of Julius Cæsar Scaliger.

Such is the sum and substance of the account set forth by Scioppius in the *Scaliger-hypobolimus* (the Counterfeit Scaliger). It looked coherent and probable, and was well attested. There was not a tittle of evidence to support Scaliger's own story, as given by his son; and Scioppius' account soon got to be generally received as coming very near the truth. Joseph Justus attempted a reply in his *Confutatio Fabulæ Burdonum* (Refutation of the De Burdon Story), but was forced to confine himself to reckless assertion and vehement abuse; he utterly failed to get over the body of proof which Scioppius' allies had accumulated. Still, the matter might have remained *sub judice* till now; but at last, one hundred and fifty years after Scaliger's death, the indefatigable encyclopædist Bayle had

the luck to discover the originals of two letters of naturalisation granted by the government of Francis I. to *Doctor Julius Cæsar de l'Escalle de Bordonis* of Verona, conceding him permission to reside, hold property, and exercise other civil rights in Francis' dominions. These letters are given by Bayle *in extenso* in a note to the article *Verona* in the celebrated *Dictionnaire*. They are issued in favour of Doctor J. C. della Scala *de Bordonis*, and they contain no reference to any other style or dignity claimed by Scaliger than that of simple physician! From that time the whole question was by the learned deemed a settled one; his princely pretensions were set down as partly a dream, a delusion which the resemblance of his father's assumed name to that of the ancient lords of Verona had contributed to foster; partly, a wilful imposture carried on by an arrogant and ambitious man, whom literary renown had failed to satisfy, and upon whose haughty spirit the recollection of the mean little shop by the stairs of St Mark sat heavily. That this is likely enough, may be gathered from the following extract from the last letter Scaliger ever wrote:

'I have fought on horseback and on foot, as a boy and as a young man, as a simple soldier and as a commander of troops. Duels, sieges, skirmishes, pitched battles, tournaments.—I have been known to expose my life in them all. Conqueror most times, sometimes I have been conquered—not, though, by valour, but by fortune. The body subdued, the spirit remained indomitable. By the noble manner in which I bore it, defeat conferred upon me more honour than victory did upon my enemies. I will not go into all the particulars. The services of my race to the realm of France, from the times of Taxilus down to my own, are known to all the world. As to my person, let him who would aspire to paint me, combine together the figures of Masinissa and Xenophon, in order to make up mine; but the portrait will never give more than a weak idea of what I am. . . . I do not speak of my extraordinary powers of endurance under heat, cold, hunger, fatigue, during whole nights and days. This is without doubt an excellent quality, but many persons possess it. What, however, is not so common, is this: at night, after despatching the business of the day, I used to compose nearly sixty verses before I supped. After supper, I dictated my prescriptions for the sick whom I had to see next day; then I retired to rest. Awakened at dawn by the importunity of messengers sent to demand my medical assistance, I questioned some, gave replies to others; then I dictated till dinner-time. When the table-cloth was withdrawn, I recited to an amanuensis the lines which I had composed the night before, without altering a single word. Who is there that will not be astounded at such a prodigy! Who is there that will not be astounded yet more if I mention that I am able, after reading sixteen or seventeen lines of *Æschylus* once over, to repeat them verbatim without tripping in a single syllable!'

Such passages might be multiplied indefinitely. They exhibit the very midsummer madness of vain-glory, and do away with all feelings of surprise that one so truly great should have stooped to an imposture so little; for, whether prince or impostor, Scaliger was a true prince among men and scholars. He had the port of a demi-god, of

such size, strength, and majestic grace was his figure. The Agennois used to gaze after him as he passed down their streets with the same feelings of interest and awe as Thackeray says he felt when, for the first time, he saw 'the grand old Goethe' wending his way through Weimar. 'When the eye of the poor fell upon him, it blessed him.' He was known among them as the good physician who never took a fee. His manner accorded well with his imposing form—'overflowing,' we are told, 'with that sort of dignity which influences a man's gait and every slightest movement.' In writing his history anew, we had no intention of moralising. Rather could we find it in our hearts to wish that he had never been found out. He asked no princely titles for his tomb; and had the *De Vetustate* never been written, the illustrious name of Julius Cæsar Scaliger would never have been enrolled in the ignoble list of unsuccessful and detected claimants.

## A DAY'S BETROTHAL.

'WELL, Jenny, it will be hard to part on the morrow.'

Jenny answered not a word, but turned away her head, looking out to sea with a wistful, sorrowful glance. The next moment, my arm was about her waist. She did not repulse me. 'Jenny,' I cried, 'why should we part at all? If you will take me for a skipper, we'll sail through life together.'

We are on board the barque *Petrel* of Greenock, bound eventually for London, with a miscellaneous cargo from the Mediterranean; and we are now anchored in the roadstead of Havre, a little to the north and west of the pier-head. Jenny is the skipper's daughter, and I am only a passenger.

How it was that I came to be a passenger on board the *Petrel*, and making love to our Jenny, I may here briefly explain. An official reorganisation had set me at liberty with a moderate pension; in the prime of life, with all the world before me, and ere making a fresh start, I had determined to have my 'wander-year.' So, after having wandered over half of Europe, I found myself standing on the quay at Naples one tranquil evening, watching the movements of the shipping, jingling the few sovereigns I had left in my pocket, and wondering if they would hold out till quarter-day, when I was suddenly accosted by name with friendly accents in my native tongue. It was some time before I recognised my interlocutor, or could bring to mind under what circumstances I had previously met with Captain Macfarlane of the *Petrel*, for such he gave himself out to be. All of a sudden, I got the clue.

Up to the last eighteen months, I had been employed in the Transport and Victualling Office in Whitehall. The *Petrel* had been chartered as a transport; and to Macfarlane, much bothered with official forms and circumlocutions, I had been of some little service, putting him in the way of getting his accounts passed, and so on. He had said at the time, that if he ever had it in his

power to do me a good turn, he would. And now, here he had an opportunity.

'And why not take passage with me to Old England?' urged the hospitable Scot, as we sat smoking and discussing a bottle of wine at a neighbouring *café*. 'Come! it shan't cost you a bawbee. Come! the blue-peter's flying. We weigh anchor to-night. Go and fetch your traps, and ye'll come on board with me.'

The offer was too tempting to be refused. Time was no object with me, whilst money was. Before I well knew what I was about, I found myself and my portmanteau stowed away in the captain's gig, which was cleaving the tranquil waters of the bay. Next, I was swinging myself up the side of the *Petrel*, and then I saw a pair of great soft brown eyes looking down upon me, and almost lost my footing by the start they gave me.

'Hoot! it's just our Jenny,' cried Macfarlane, in answer to my look of inquiry directed towards our fair fellow-passenger.—'Jenny, this is Master Willie Thorpely, to whom I'm under great obligations, and I hope we'll mak' him comfortable among us.'

Well, it was too late to recede, and, after all, it would not be for long.

And if it hadn't been for those baffling winds, we should have been safe enough. We did not get to be real right-down friends, Jenny and I, for a whole fortnight, by which time we ought to have been in sight of the white cliffs of old England, and the sobering influences connected with them. But we had three weeks more of it—a happy halcyon time—that culminated in the scene with which I began this narrative.

We had called at Havre, to dispose of part of our cargo, and the captain and mate having gone ashore to settle some dispute with some of his crew who had unwarrantably deserted the ship, left Jenny and me on board, in charge.

We were practically alone on board. The steward was busy in his caboose, the black was asleep somewhere forward—in the sun—the ship was riding easily at her anchor with almost imperceptible motion. The town was shimmering pleasantly in the sunshine, and the white villas on the wooded heights above shone like so many caskets of ivory. It was low tide, and a strip of wet glistening sand was visible along the shores of the bay; bathers were splashing about; amateur shrimpers were pushing their nets before them in the shallows. Beyond, the bold headland of the Cape la Heve, crowned by its two white light-houses, assumed the appearance of some lazy pacific beast couchant on the sands. Time and place were alike propitious. I turned to Jenny, and spoke to her of our approaching separation; then I made the final plunge. O those baffling winds! how much they had to answer for.

What Jenny's feelings might have been after that decisive moment, I cannot tell. Mine approached stupefaction. All the difficulties and disadvantages attached to the step I had taken, now shewed themselves to my mind's eye in the

strongest colours ; and a life of straitened means and perpetual petty self-denial, tinctured with the idea of a life of miserable respectability, presented themselves in ghastly array.

There is an advantage, however, in seeing the worst at once. Having suffered my moment of agony, I began to recover. Jenny, poor child, had not noticed the sudden chill that came over me ; she was too much agitated and occupied with her own feelings ; and as her head rested upon my shoulder, and her eyes looked into mine with trusting confidence, I began to realise the truth, that I had succeeded in winning for myself a charming, affectionate companion ; that my life would no longer be lonely and self-contained.

The tide had turned ; the flood had begun to make. The ship was swinging slowly round, presenting to us the opposite half of the horizon. A loud warning crash from the awning above made us both look up. Never shall I forget the shock of the altered scene that met our eyes. The sun was still shining bright overhead, but to seaward a vast livid wall of vapour shut out everything from view. A shrill blast of wind trumpeted loudly in the rigging, which began to flap, and creak, and strain. The sea was rising rapidly, and waves came rushing in, crested with driving foam. Then the sun was obscured, visible only as a faint and watery blotch ; the hills crowned with sunshine, the busy, happy town, all were blotted out ; we were alone amid a sudden storm and fierce rising sea.

Jenny sprang to her feet, and, with admirable calmness, began to lower the awning ; but in a moment the wind was upon us in full force ; the canvas flapped wildly, and then, torn away from its fastenings, flew away to leeward, visible for a minute in the sky, like a white sea-bird, and then lost in the gloom.

'Won't father be angry !' cried Jenny, clasping her hands ; 'so many yards of good canvas.'

'Are we not in frightful danger here ?' I said. 'Why, I wonder, has your father not returned ?'

Jenny shook her head. 'One can't foresee everything. Perhaps he is now on his way.' She took up the binocular, and peered anxiously through the mist. But no boat was to be seen. The sea seemed of a sudden deserted, except for one or two fishing-smacks to the southward, that, with great brown sails half lowered, were scudding rapidly for the harbour. But for us, in the teeth of this south-westerly gale, the harbour-mouth was as inaccessible as the moon.

Jenny left the poop, and ran forward to the forepart of the vessel. I followed her as well as I could, holding on by this and that, for our ship was now pitching heavily upon the swell. I found her by the bowsprit, watching the rise and fall of the ship with anxious eyes. The great black chain that, as the vessel fell, would be invisible in the waves, as she rose, stretched itself tight as a bowstring, with a clank and groan that made one shudder. Our lives hung upon that chain, that the waves seemed to sport with as a toy. As we stood there, a wave larger than the others rose upon us without warning, and swept the deck with irresistible force, bearing everything movable with it. I clung desperately to a belaying-pin, and Jenny clung to me ; and after a while the *Petrel* rose gallantly to the shock, the water streaming

from her sides. Drenched and cowed by the violence of the shock, we made our way back to the poop.

As we reached the cabin door, the steward was reeling across the sloppy deck, carrying a steaming dish of potatoes. It was three o'clock, the hour for dinner. Sink or swim, he would have the dinner on the table by three ; then his cares were over for the day, and he devoted himself to rum and tobacco.

'You surely can't eat, Jenny,' I cried, as, after she had changed her dripping garments for dry ones, she sat down at the table with what seemed to me almost fiendish indifference.

'Eat ! You must eat !' she cried. 'Who knows what an hour may bring forth ! If you have to swim for your life, will you have any chance if you start exhausted ?'

I saw that she was right, and we snatched a hasty meal together as best we could. Just as we had finished, a quiver ran through the ship ; the motion changed ; she began to roll heavily. The sofa on which we were sitting broke away from its fastenings, and we were thrown violently from one side of the cabin to the other, in the midst of an avalanche of all the movables that were unfastened, or had broken away.

As soon as we regained our feet, we made for the deck. I thought that the last moment had come, and desired only to see daylight once more. We had parted from our anchor, and were drifting rapidly away towards the dark bristling cliffs to leeward.

The sight seemed to restore confidence and courage to Jenny. 'Go forward !' she screamed in my ear ; 'go forward, you and the steward, and get the lower sail on the foremast ; black Jem and I will steer the ship.'

Jenny's voice inspired me ; the prospect of doing something to avert our fate gave me new strength. I stumbled forward, holding on to anything that came to hand. The steward stood at the door of his caboose, having jammed himself into a secure position ; a pipe was in his mouth, and a black bottle in his hand. He looked at me with lack-lustre eyes. 'Come along, man,' I shouted in his ear ; 'come and help me to get up sail.'

'What's the odds ?' he replied in a sullen voice ; 'what's the odds ? Let's be happy while we may !'

The man was drunk. I cast a despairing glance behind me when the poop, raised high in the air by some towering wave, seemed almost to touch the sky. Jenny was at the wheel, shading her eyes with her hand, looking anxiously forward. Ah ! what could I do among all this bewildering maze of cordage and rigging, all shaking and rattling in the wind—I who hardly knew one rope from another ? But the sight of Jenny at the wheel, looking out for me, nerved me to do something. I made my way to the foremast, and clambered up the rigging. Sometimes I hung over the boiling abyss ; sometimes I found myself pressed against the rigging, looking down at a precipice of water beneath me. Loose ropes and flying blocks threatened me every moment with destruction ; but I held on to the ropes like grim death, and, inspired by the courage of despair, I essayed that which at another time I should have never dreamed of : I crawled out on the yard, with my knife in my teeth, and cut, one by one, the lashings that bound the sail to it.

The sail flew out with a tremendous report, and threatened every moment to tear itself to tatters; but, seizing a rope, I slid down to the deck with a rapidity that took every morsel of skin off my ankles; and getting hold of the rope that I saw controlled the movements of the sail, I hauled it in bit by bit, and succeeded in making fast one side of the sail. The other offered less difficulty. Jenny waved her hand triumphantly from the poop. The ship began to move through the water, no longer to drift helpless and forlorn. We should clear the headland, that now loomed so ominously upon us, crouching there like some hungry animal awaiting his prey.

I crawled back to the poop, and Jenny rewarded me with an encouraging grasp of the hand. 'You did that beautifully,' she cried. 'Now, if the gale moderates, as I think it will, and doesn't veer round more to the westward'—

As she spoke, we shot past the headland, and gained a clear view of the coast beyond. The sun was sinking low, and shewed for a moment a blood-red streak between two angry clouds. The lurid light it cast upon the red frowning cliffs was something appalling. They ran along for miles, as far as the eye could reach—steep, inaccessible heights, with the surf beating angrily against them, and flying up in clouds of spray half-way to their summit.

As the sun went down, it came on to blow harder and more from the westward. The line of cliffs to leeward loomed nearer and nearer. The sail ceased to draw, beginning to shake and flap with a loud noise.

'She will go no nearer the wind, Willie,' cried Jenny, knitting her brows; 'and we drift continuously to leeward. You must haul that sheet tighter, Willie; it's our only chance.'

I was running forward to my work, when a block, detached from the rigging by the force of the wind, struck me violently on the head, and I fell to the ground insensible. When I came to myself, my head was aching violently, although it seemed to be supported by a soft pillow. It was quite dark, and the air was full of hideous noises; the scream of the wind, the loud roar of the surf, filled the air with a tumult indescribable. 'Where am I?' I said, feebly stretching out my arms into the darkness. I felt arms about mine, a soft kiss imprinted on my forehead.

'We shall be ashore, dear, in five minutes,' said a voice in my ear, 'and all our troubles over.'

I raised myself up, with a groan, and tried to gain my feet, but fell back exhausted. The scene about me struck me with terror; the thought of drowning helpless in this raging gulf of waters had an ineffable bitterness for me.

'Willie,' said Jenny once more in my ear, 'if you get safe ashore, will you give my love to father?'

Then I found that I was lying beneath the shelter of the poop-deck, protected a little by that from the seas that were breaking over us, and that a life-belt was fastened under my arms. Jenny was crouched beside me, holding my head in her lap, chafing my temples and hands.

The few minutes that elapsed before we struck seemed as an age. The wind beneath the cliffs was not so violent, and the back-current of the waves kept us for a moment away from the rocks which we almost touched. But the respite was

not for long; we grounded upon an outrunning spit of rock, and instantly the sea made a clean sweep over us, carrying away masts, spars, rigging—everything went by the board. I had seized Jenny at the moment of striking, and we were hurried away together in a hideous trough of cordage and timber. Dashed violently against a mass of slippery chalk, which afforded no purchase for hand or foot, I lay there, fairly exhausted, expecting every moment the return of the wave that would sweep us back into the gulf, when I thought I saw a light close beside me shining into my eyes, and a face peering anxiously over the waters. It was a delusion, one of the hallucinations of approaching death. Next moment we were covered with blinding surge, and a great green wave swept over us, driving us pell-mell before it with inconceivable fury. I lost my senses for a while to find myself jammed in between two fragments of rock. Jenny was gone. I had lost my hold of her, and she had been carried away into the boiling gulf.

I had nothing to expect myself but instant death. The next wave would wash me out of my hole, a mere crevice in the precipice. I had hardly strength enough to breathe, and could fight no longer against my fate.

But though I was constantly covered with surf, and nearly suffocated, yet the waves did not reach me with full force. The tide was retiring.

Time passed on, I hardly knew how, till the moon rose red and menacing. The tide was down now, but the surf reached to the very base of the cliffs. The flood would come presently, like a lion to his half-devoured victim, and I should perish. Then I heard voices below me, and saw by the moonlight some men draped in short smocks or blouses groping about among the rocks beneath me. They were countrymen, evidently, who had been attracted by the wreck, and who had found their way down the cliffs by some concealed footpath. I shouted—they heard me, and clambered to my retreat. They were full of compassion and kindness. They carried me along the base of the cliffs by a foot-path among the debris, till they reached a smooth gap in the wall of chalk, by which they ascended. I was presently carried to a house, stripped, and placed in a warm bed. I recollect just this much, and then memory fails me. I had a long illness, I am told, and was near death's door, but recovered at last, and found myself the guest of a worthy Norman farmer, who occupied a charming little homestead on the heights above the sea.

As soon as I could get about, I went down to Havre to inquire about the *Petrel*, at our consulate. She was lost, I was told, on such and such a night, with all hands on board at the time. The captain had returned home two months ago. I determined to go home at once, and leave a place so fraught to me with sad memories. Now that Jenny was lost for ever, I realised how much she had been to me. Her kindness, her courage, her devotion, her charming gaiety and animation, recalled themselves to me, and I told myself that I should never see her like again. I inquired as to her last resting-place. Only two of the bodies had been found, it seemed—those of the cook and the black cabin-boy.

Well, it remained only for me to return to England, a saddened, melancholy man. I left my watch with the good farmer who had taken care of

me, as some recompense for the trouble and expense to which he had been put. The captain of the *John Bull* gave me credit for my passage-money, and I landed at St Katharine's Wharf without clothes but those I wore, sadly stained with seawater, and with only a few shillings in my pocket. But there was money due to me for my pension, a couple of quarters now, and I took a cab to the Paymaster-general's Office to get it.

'William Thornley,' said the clerk, looking at his list. 'Why, he's dead—struck off the list two months ago.—You're the man, you say. Well, I'm sorry to say that only a Treasury order will bring you to life again.'

The *personnel* of the office was almost entirely changed since I was last in England. The old clerk who used to pay me had been pensioned off, and there was no one who recognised me. The information came, I was informed, from my old office, and there I went in much chagrin. There could be no difficulty in eventually getting the matter put right, but in the meantime I wanted money—money, and didn't know where to get it.

I went to the old office. The place once so familiar to me, now knew me no more. One of my old chums was still there, and him I found out. He looked at me, stared, burst into laughter.

'What! you're not drowned, then?' he cried.

'Drowned? No! but precious near it. Who stopped my pension, pray?'

'Oh, some friends of yours came here: a sea-faring party, and a pretty girl in deep mourning—a deuced pretty girl,' said my friend, pausing, and beginning to bite the stump of his pen. 'Well, they gave me a long account of your loss on board the *Petrel*. Why he came to me was, that he remembered my name as a fellow who knew you, don't you see? Of course, I was very sorry to hear it, and all that; and then the old captain asked me who your relations were, and I couldn't tell him; but I said I'd make inquiries; and as they were going to Scotland, they promised to call and see me again on their return. And, by Jove, here they are!' said my friend, rising as the room door was thrown open, and the messenger announced a gentleman and lady to see Mr —, by appointment.

I was sitting with my back to the door, and turned my head towards it. A young woman in black ran forward with a scream. I sprang to my feet, and clasped Jenny in my arms—Jenny, safe and sound, but pale and worn—suffering for me!

Her father, it turned out, had been on the cliff, and had followed the *Petrel* along the shore all that eventful night; he had offered five hundred pounds in vain for a tug to put out to the rescue; and the life-boat, although she had tried to get out, had been beaten back. He had seen the ship coming ashore, had lighted a blue-light, which I now faintly remembered to have seen, that revealed our position. Just above, on the cliff, it happily chanced that there was a crane, used for raising blocks of chalk from a quarry half-way down, which was provided with a chain and bucket; and aided by some douaniers, he had descended by this means the face of the precipice, and had caught hold of his daughter as she was swept away from me in the last mad rush of waters. He was an eye-witness, as he thought, of my loss in the abyss, and had never dreamt that I could possibly have escaped.

'I wish you'd have stopped drowned,' said my

friend between his teeth; but for all that, he stood best-man at my wedding, and my rough day's betrothal has been followed, thank God, by a union of constantly increasing happiness.

## THE MONTH: SCIENCE AND ARTS.

DR KLEIN, F.R.S., whose name ranks high among physiologists, states, in a recent work on the Lymphatic System, that the diaphragm in the human body acts as a pump upon the lymphatic vessels. Hence it is important that the activity of the diaphragm should be maintained. If the pumping action be disturbed or prevented, dropsy may be the consequence. 'The senior physician of the Hospital for Diseases of the Chest mentions Klein's discovery with admiration, and says: "Henceforth, we must add to the hitherto recognised causes of dropsy in chest disease the paralysed condition of the diaphragm; and we shall at once see that the removal of this by all practical means ought to form one of our anxious considerations in the treatment of winter-cough, bronchitis, asthma, and other forms of chest disease."'

In the present day, medical science owes much to physical science, especially to acoustics, optics, chemistry, and electricity. As the President of the Royal Irish Academy said in his last anniversary address: 'The discovery and differential diagnosis by auscultation of the normal and abnormal state of the heart, arteries, air-tubes, pulmonary cells and in many instances of the abdominal viscera has been carried to a great point of advance. The ophthalmoscope has revealed not alone changes of the eye, but of organs distant from the eye—cerebral, cardiac, and embolic disease. . . . The endoscope enables us to discover, to study and measure a vesical calculus, an almost capillary stricture and to direct a local treatment to an ulcerated state of the intestinal surface. In surgery, too, we can make use of anaesthetics to prevent all pain in operation, whether they be used by inhalation or direct contact with the part. The loss of blood too, under the knife is prevented in most cases by the method of Esmarch. In a recent case of amputation of the hip-joint, the Regius Professor of Surgery in the University of Dublin remarked that it was the first time he had witnessed a great operation performed, not only without pain, but without the loss of a single drop of blood.'

It has been held as a fact in physiology, that in drowsiness and sleep the eyes are turned upward and inward, control of the ocular muscles being lost. But Professor Le Conte, of the University of California, has made experiments which prove the contrary; and as the experiments are not difficult of repetition, we summarise his account of them. 'There are few persons,' says the professor, 'who have not experienced an unconquerable drowsiness while listening to a dull speaker on a warm summer afternoon. Every one at such times must have observed that, as the control over the ocular muscles is lost, the head of the speaker becomes double; the two heads separate more and more until they may seem ten or fifteen feet apart. It

my own case, the control over the eyes is lost even while the consciousness is perfect, and the mind is in a condition to make a scientific experiment. . . . As soon as the head of the speaker doubles, and the two images are well separated, I wink the right eye. Invariably the left image disappears. The images are therefore heteronymous, and heteronymous images in this case prove optic divergence.' Professor Le Conte remarks, that in the course of twenty years he has made this experiment hundreds of times, and always with the same result, and has corroborated his experience by that of others. Moreover, it may be confirmed by gazing on vacancy during drowsiness, when it will be seen that the double images of the nearer objects separate more and more. The professor believes that binocular vision is a consequence of the perfection of the human eye, and that it does not exist in the lower animals. His views as regards the stages of development of visual power in the vertebrata are thus set forth: '1. A gradual change of the position of the eyes from the *sides* to the *front* of the head, and a consequent change of the angle of inclination of the optic axes from one hundred and eighty degrees to parallelism. 2. A gradually increasing graduation of the fineness of organisation, and therefore the sensitiveness of the retina, from the anterior margins toward the central parts, so as finally to form in monkeys and in man a central spot. 3. A gradually increasing power of converging the optic axes upon a single near point, so that the images of that point may fall upon the central spots of both eyes. 4. The gradual evolution of the properties of corresponding points, and therefore of all the phenomena of binocular vision. These changes,' concludes the professor, 'seem all intimately connected with each other and with the development of the higher faculties of the mind.'

In the discussions about 'evolution' and origin of life, we have heard a good deal concerning those minute creatures, *bacteria*; but there is another subject—namely, disease, in connection with which their name frequently occurs. The Presence of Bacteria in Disease, is the title of a communication made to the Medical Microscopical Society by Dr Payne. He says that they are found not only 'externally, as in parasitic diseases of the skin, but internally, as in malignant pustule, where bacteria in large quantities are seen in the blood, and in the discharges, forming the *materies morbi* of that affection.' The same occurs in the class of specific fevers, and in pyæmia from wounds; and, according to the doctor, it is in this last-named disease that the existence of bacteria can best be studied. Recent researches have shewn that the clots or lumps which occasionally choke the veins are sometimes composed in great part of bacteria, and the same minute creatures appear to be the occasion of affections of the kidneys. The investigation of this subject further by the microscope is therefore recommended to students of anatomy and physiology.

The diamond drill continues to prove its superiority over all other tools for boring into rocks and stones, however hard. Quartz, glass, and granite can be easily pierced. The drill, driven by steam, makes from two hundred to three hundred revolutions per minute; and the diamonds do their work, not by cutting, but by actually wearing away, under pressure, the substance which is being

bored. Hence it is not necessary to give a cutting edge to the diamonds.

In the diamond mines of Brazil there are found lumps of carbonate, which are called black diamonds, and it is with these that the diamond drills are made. The gem—the real diamond—is crystallised; the carbonate is not, and therefore does not split under the enormous pressure to which it is subject in drilling. When first brought to Europe, the black diamonds were offered at fourpence per carat; they are now worth from fifteen to twenty-five shillings per carat.

For mining purposes, for quarrying, tunnelling, and blasting, the diamond drill is invaluable. In 'prospecting,' too, its rapidity of operation is greatly in its favour, as in a few hours it will bring up more specimens from underground than could be obtained in a week by other means. In July 1874, a boring, three inches diameter, was commenced in Bohemia, and in one hundred and thirty days was sunk to the depth of 2300 feet. At Widdrington, Northumberland, 1565 feet were pierced in two hundred and sixty-five days; and at Middlesborough, 1355 feet in two hundred and ten days, and in each case the cores brought up made known the strata through which the tool passed.

Further, the diamond drill can be used under water, and a great work is now going on in the blasting and removal of a reef at the mouth of the Tees. A barge, containing the drilling-machinery, is moored over the place to be blasted; the drills are set to work; holes are bored, and are plugged with cartridges of dynamite. These are fired; and in this way two hundred thousand tons of rock are to be broken up and removed. This success has led to the propounding of a scheme for the removal of that formidable danger, Daunt's Rock, off the harbour of Cork.

As an instance of the mighty applications of mechanical power which this age brings forth, we may mention that at the Crewe Steel Works a circular saw cuts slabs from hot steel ingots as easily as an ordinary saw cuts boards off a log of oak. The slabs vary in width from twelve to twenty inches. Ingots or cranks can thus be accurately and cleanly shaped, with great economy of time and labour. This tremendous saw is five-sixteenths of an inch thick, seven feet diameter, makes one hundred revolutions per minute, and has a speed of one hundred and fifty miles per hour at its circumference.

A description of a novel mode of putting in a concrete foundation was given at a meeting of the Institute of British Architects. Gas-works were to be built in a marsh, and an excavation was required for the gasometer. Instead of excavating to a great depth, with piling, strutting, and shoring of surrounding earth, cylinders of concrete, about six feet in diameter and six feet in height, were let in. The lowermost section was pointed, the soft soil was lifted by machinery, the cylinder sank by its own weight; another section was put on, and another and another, until the heavy mass had penetrated to the required depth. On a series of cylinders, or columns, thus sunk through the marsh, the gasometer, two hundred feet in diameter, was erected.

In engineering shops, much of the work is shaped or polished in a lathe. In finishing or polishing very thin disks, it is found difficult to

fix them accurately to the chuck without much loss of time, and this has led to the invention of an electro-magnetic chuck, which, when connected with a battery, can be magnetised or de-magnetised at pleasure. The chuck is placed in the lathe, contact with the battery is made, the disk is presented, and clings tightly to the chuck by the magnetic attraction; and when the polishing is complete, contact is broken, the chuck ceases to be a magnet, and the disk falls off. This, as will be understood, offers, for light articles, an advantage over the usual method of fixing by cement.

Experiments have been made at Mulhausen to ascertain what kind of coating best prevents the escape of heat from steam-pipes. After numerous trials, it was found that chopped straw was the best, and that it reduced the loss of heat by radiation from the bare pipes 66 per cent. The next best was a pottery pipe large enough to cover the steam-pipe and leave an air-space: the pottery pipe was coated on the outside with loamy earth and chopped straw, kept in place by straw bands twisted round the pipe. This reduced the loss 61 per cent. The next was cotton-waste, which, wrapped round the steam-pipe to an inch thick, reduced the loss 51 per cent. The next was waste felt from printing-machines, under which the reduction was 48 per cent.; and the last was 45 per cent. with a plaster made of cows' hair and clay. Experiments made with a view to test the effect of colour, shewed that the coatings, when painted white, reduced the loss a further 7 per cent. Particulars of these experiments are published in the Reports of La Société Industrielle de Mulhouse.

Many are the persons who cultivate flowers for love; that is, love of flowers. At times they meet with strange freaks of growth or changes of colour, which are talked about for a little while and are then forgotten. These 'sports,' as gardeners call them, would have great interest and value for the physiological botanist if a record were kept of all the circumstances of planting, growth, and decay. It is highly desirable that science and art should aid one another in the cultivation of flowers, as in other objects: one discovers the fact, the other explains it. As Dr Masters remarks in the *Journal* of the Royal Horticultural Society, the florist should 'carefully note the phenomena as they present themselves to him,' and the physiologist, by co-relating the florist's facts, should make known their interpretation, and deduce from them rules or laws for the guidance of the cultivator. 'It requires,' continues Dr Masters, 'no great stretch of faith to foresee the time when the physiologist will be able to supply the florist with a clue whereby he may, within limits, be able to produce at will a pink *Gloire de Dijon* rose, or whatever else the needs or caprice of the time may dictate.'

Mr Prestoe, government botanist at Trinidad, made, in April last, an exploratory journey into the mountains, to see a large boiling lake. The country thereabouts is volcanic, pierced by numerous soufrières, or sulphur-vents, among which the boiling lake is probably the biggest. The dimensions of the lake are not given in Mr Prestoe's Report; but we are told that the water is gray in colour, with a temperature of one hundred and ninety-five degrees Fahrenheit, and is more than one hundred and thirty-five feet in depth. The outlet of the lake is by a deep ravine, which grows

every year deeper; and the supposition is that, by the consequent loss of water, the lake will in time become a geyser. Meanwhile, a large formation of gypsum is going on.

The low temperature of the adjacent valleys is remarkable, ranging from sixty-five to sixty-eight degrees only. The district, in Mr Prestoe's opinion, offers great advantages to agriculturists. He describes the soil as 'surpassingly fertile,' and as rich on the hills as that of West Indian valleys generally, and that large areas are well suited for cultivation of the cinchona. We may imagine that, after reading such a Report as this, Trinidad will remember that there is such a word as enterprise.

Governor Rawson, of Barbados, has published a Report on the rainfall of that island, and its influence on the sugar-crops. The conclusions arrived at are based on observations extending over a period of twenty-five years, and so many interesting and suggestive facts are brought into the argument, that the Report may be studied with advantage by agriculturists in all countries. The changes of seasons and differences of elevation are taken into account, comparisons are made, and data are laid down from which the amount of crop in the current year may be predicted or calculated from the rainfall of the preceding year. The average yearly rainfall of Barbados is nearly fifty-eight inches; but we remark that in some years the quantity rises to seventy-eight inches, and falls in others as low as forty-one inches.

Lieutenant-colonel Ross King, in a communication to the Geographical Society on the Names of Places in Geography, raises a question in which many readers will agree with him. It is, the practice which prevails of ignoring the native names, and of giving British names to places in newly explored countries. He suggests, that if a place has a native name it should be retained; if not, a name should be invented, so as to avoid the repetitions that now exist. He points out that there are in different parts of the world twenty Yorks, seventeen Lincolns, nine Gloucesters, and eight Cambridges. In North America there are nine Smithfields and seven Londonderrys, and New South Wales and Tierra del Fuego have each a Londonderry. A London on the Thames, in the county of Middlesex, is to be found in Canada; a Stratford-on-Avon in Australia, an Aberdeen in British Columbia, and a Dundee in Patagonia. Colonel Ross King is right in condemning this mistaken practice, and we hope that henceforth the native names of places will be recognised. Toronto was named York by the early settlers; but Sir John Colborne changed it back to Toronto, which, in the Indian tongue, means Place of Assembly; and is there any one out of Africa who would like to see Lualaba, the musical name of the stream discovered by Livingstone, superseded by 'Webb's River?' There is already a Newcastle in those parts, and we are told that a Cheetham Hill has been nominated within sight of Kilimandjaro. It would be easy to multiply examples, but these may suffice to indicate the evil complained of, and we heartily wish success to Colonel Ross King in his praiseworthy endeavour.

## A LIFE'S REGRET.

I AM the youngest of three sisters—Margaret, Louisa, and Helen, the last-named being of course myself. We reside in a small villa on the outskirts of the town of Norton-Folgate, and, from all appearances, are likely to remain for the rest of our lives pursuing what strangers would suppose was the calm and even tenor of a colourless existence.

Our income, though small, admits of our keeping two domestics; and when we pay visits, which at rare intervals we do to some of the county families, we jointly subscribe and charter a close carriage, which enables us to make our calls with something like dignity. Not that my two elder sisters are lacking in that respect, for they never, either sleeping or waking, I believe, forget that our late father was descended from an ancient and honourable family, and that the name of Howard, which we bear, is derived from a source which, even though it does not acknowledge us, is ours justly; and on the tree which testifies to our pedigree our relationship is clearly set forth. Our late mother could also boast of gentle blood, so that on both sides of the house our connections were undeniable.

In addition to those advantages, nature had not been unkind to us—indeed, in our younger days we had had our own share of admiration, and the three Misses Howard had on many occasions been pronounced the best-looking girls at the numerous balls which, chaperoned by our mother, we used regularly to attend. Our admirers were not few, and we were always engaged for every dance whenever we went; but there to all appearance it ended, for after more seasons than I care to record, none of us was married. Plainier girls by far, even penniless ones, in due time made their appearance, had an interval of gaiety, and then announced their engagements, which duly ended in marriage; and they would return in all the dignity of matronhood to patronise and remind us in more ways than one of the wide gulf that separated our unappropriated selves from them and their 'position' as married women. At first, it was not

so galling, but by-and-by I began to feel it keenly, and to long—as every woman does sooner or later—for ties of my own; but my longings were not to be gratified, for the one hateful reason, that no ordinary man was supposed to be good enough to mate with 'a Howard,' though one degenerate descendant dared to wish it could be otherwise.

By degrees it became known that we were hard to please, and though it was true enough of Margaret and Louisa, still I felt so differently from them on the subject, that it was rather hard to be included; but I was 'a Howard,' and so had to pay for my privilege.

Margaret was seven years my senior, and Louisa five, consequently, I was accustomed to being considered quite a child until I had attained the ripe age of twenty-five, when an event happened, which, but for my precious pedigree, might have changed the colour of my whole existence.

We had received invitations to a ball given by a certain Lady Aylmer, who always made a point of asking us to her entertainments; and though I was beginning to be very weary of gaieties, to decline was out of the question; so, after some deliberation as to our attire, &c., an acceptance was sent; and when the evening arrived, we, accompanied by our mother, crushed ourselves into a hired carriage, and set out for Aylmers Court.

We were received as usual, most cordially; and after a few dances were over, I became conscious of the presence of a gentleman, who seemed to regard me with some interest. He was a very nice-looking man of about thirty, rather fair, and with a small moustache slightly inclining to red. He was not tall, neither was he very short; his figure was good, and he had a soldier-like look about him which I rather admired.

As usual, I was well supplied with partners; but when Lady Aylmer approached with the individual I have just described, and introduced him to me, I was very glad I had a spare dance still left, for which he at once engaged me.

I did not catch his name when Lady Aylmer brought him up, and when my eldest sister

inquired who my new acquaintance was, I could only say he was a Captain Somebody: I fancied Bruce was the name.

'A good name,' remarked Margaret; 'I daresay he is a relative of Lord Bruce.'

But I was doomed to undeceive her shortly, for on addressing him as Captain Bruce, he smiled, and told me that was not his name—his name being Bebb.

Bebb, I thought—what a funny name! However, it did not prevent my thinking him very pleasant, and being secretly glad when he told me he was to be quartered at Norton-Folgate for some months to come.

To be brief—after several meetings, Captain Bebb, whose name had now transpired in my family, began to pay me marked attention; but although in my inmost heart I liked him, still I was well aware that for 'a Howard' to ally herself with a Bebb would be regarded as an impossibility by my family.

He came to call—endeavoured to ingratiate himself with my mother and sisters—sent me bouquets, books, music, and, in fact, did all he could to shew his preference, which in my heart of hearts I would fain have shewn was mutual. But how could I? My sisters, alarmed by my evident leaning towards him, instituted a system of ridiculing him, which, had he only faintly guessed, would, I felt sure, have prevented him from ever again entering our house.

His personal appearance was stigmatised as the most vulgar that had ever been seen; his hair, which was really brown, was always alluded to as carrots; and a shuddering fit frequently overtook Louisa as she described the horror she had experienced when, on one fatal occasion, he had shaken hands with her, and his hot clammy clasp had almost given her a fit.

Perhaps owing to this, his name degenerated from Bebb into Blubber, and several times my mother herself narrowly escaped addressing him as such, so persistently was he called it behind his back.

A dead pig having been found one morning in the sty, I was strongly advised to go down to see the likeness, which, from my partiality for Blubber, my sister felt sure would be interesting to me. I am ashamed to confess that I had not the moral courage to refute those uncalled-for calumnies; these incessant cruel taunts were enough for me; and when I did receive a proposal of marriage from Captain Bebb, my answer may be imagined. I refused him, and cried myself to sleep for many nights afterwards.

But the deed was done, and Captain Bebb was not one to ask again, and I heard soon afterwards that he had left Norton-Folgate.

Very little was thought of the affair in my own family, and of the general opinion I am of course unable to speak. The idea that I, 'a Howard,' had been asked to become Nelly Bebb, or Nelly Blubber, sometimes elicited would-be witty re-

marks from my sisters; but by degrees the existence of Captain Bebb came to be totally forgotten by every one except myself.

Meanwhile, we did not grow younger as the years rolled quickly on, and as they went I became more and more conscious of the error I had made in rejecting a man, whom I felt I could have loved and respected, simply because he was ridiculed by my sisters, and bore the unaristocratic name of Bebb.

Seven years had passed away—still we were 'going out to parties'; I, unwillingly, but my sisters more persistently than ever. But, alas! times had changed for us; partners were no longer plentiful, and we were obliged to be thankful to the few who asked us to dance, or offered to escort us to supper, and who were, generally speaking, mere boys, whose nursery days seemed like yesterday. However, rather than return home without having danced at all, I was indeed glad to take a turn with them. But on one particular occasion at a ball in the Assembly Rooms, even the boys failed us, and the three Misses Howard were standing together in a most palpably family group, when the entrance of a large party gave us some momentary diversion.

It was the Aylmers Court party—Lord and Lady Aylmer, two or three dowagers, a bevy of bright-eyed pretty girls, and several gentlemen. Amongst the latter, who should I recognise but my old friend and rejected admirer, Captain Bebb!

He was looking remarkably well—happy and handsome; no resemblance to a pig was possible now, surely, and for an instant a wild hope shot through my poor heart that he might see and speak to me again. He did see, but instinctively I felt he hardly recognised me.

Seven years had not improved me—with a bitter pang I felt that. He bowed, and passed on with a young and pretty girl leaning on his arm. Oh! the mortification of that evening—the weary desperate longing I had to hide myself somewhere; but there I stood, a faded 'wall-flower,' youthfully attired in white tarlatane and blue satin ribbons, unnoticed, neglected, and, what I felt far more, uncared for.

Whether he meant it or not, I could not tell, but he seemed to be perpetually passing where I stood. At last, my sisters consented to go home, and Margaret having secured the arm of a weak-minded little curate, who offered his other arm to my mother, the three walked slowly across the ballroom, followed by Louisa—proud, erect, and indignant, at the want of appreciation she had met with—and myself, with downcast eyes and a burning face. The cloak-room seemed a haven to me, and the drive home was comparative bliss, although it was embittered by remarks from my sisters on the re-appearance of Captain, or as he was now, Colonel Bebb, and the announcement that 'after all, Nelly might have done worse.'

Yes; Nelly knew that now, many another foolish girl, or elderly young lady, knows when it is too late; and in my quiet corner, a few heavy tears dropped silently upon my crimson

shawl, when I remembered how I had allowed myself to be influenced by ridicule to reject what I felt sure would have secured the happiness of my life.

But our ball-days ended at last, for our mother died, and after that Margaret and Louisa gave up the gay world, and devoted themselves to mothers' meetings, Bible readings, and various other laudable occupations, to the great satisfaction of the curate I have before mentioned. We settled down in our little villa, and are now three confirmed maiden ladies, without much to make us care for life, beyond the daily colourless routine which makes 'each day twin image of the last.'

Once a year we go for a month to the seaside, and during our last visit there I became much interested in some children, who, accompanied by their nurse, used to make their appearance at an early hour every morning on the sands. I was so fond of children that I soon made their acquaintance. Little Amy was four, and the elder girl about a year older, whilst there was a boy of about two—Master Charley, as his nurse called him. It never occurred to me to ask what their surname was, though they became quite confidential as to their small affairs generally. Papa and mamma were in London, but they were coming down soon; and at home they had all sorts of possessions, from ponies and a tiny little basket-carriage, downwards. Would I like to see them? But what was my name if I did come?

'Helen,' I answered; 'but they call me Nelly at home.'

'That's my name,' exclaimed the elder child. 'But what is your other name?'

'Nelly Howard,' I replied, much amused at her pertinacity.

'Mine's Nelly Bebb. My papa is Colonel Bebb, and he's got a Victoria Cross, and lots of medals.'

'Your papa!' I answered, staggered at her announcement, which I found was indeed what I instantly supposed. They were the children of my rejected admirer, Captain Bebb.

The little group on the sands had a strange fascination for me, after I knew it, and furtively I conveyed many little gifts to the children. But our prescribed month was now over, and though the weather was enchanting, our rules were those of the Medes and Persians—go home we must. So we went; and my last glimpse, as we drove to the station, was of my three little friends—a joyous trio, with Colonel Bebb, a shade stouter than of old, but looking bronzed and jovial; whilst beside him stood a bright-faced, pretty little woman, who had accepted the happy fate which I, in my senseless girlhood, had declined. But it is over—regrets are vain, and though my heart feels young still, I am fast fading into old age now.

My experiences, recorded here, may make another wise, for out of the depths of my bitter disappointment I have written the short story of my mistaken existence. For, though doubtless there are many happy old maids, woman was not made to live a single life. Home ties, family cares, troubles and anxieties, may be her lot; but if she is loved, and if she feels herself the centre of a little kingdom—poor, perhaps, but precious—she has joys to balance the cares, love to smooth over the troubles, and a strong arm to shield her from danger. With that around her, she is a tower of

strength; she possesses that which makes life's bitters sweets; nor can she ever have to record what I, the poor neglected old maid, do here, the history of a Life's Regret.

## OUR SUMMER MIGRATORY BIRDS.

Few books are more eagerly welcomed by a lover of country life than a new book on Birds. The seasons as they come and go are identified with their special birds. He delights in the knowledge that spring is here in earnest, when he notices the first sand-martin over the river buffeting the lusty gales of March; blue-eyed April comes attended by her swallows; May brings the swift; the cuckoo calls in June. If a lull comes over the powers of the singing birds during summer, in September the corn-crake's characteristic notes fall upon the ear. An ornithological timepiece for each month could easily be constructed, as some botanist has arranged the flowers of every week in the year. When the delightful tribes of summer visitors leave us in late autumn, a wholly different set of birds, most of them associated with nights and days of sport, takes their place; ducks, geese, curlews, plover, and their congeners amongst the swimmers and waders, appear on the lakes and sea-coasts, and stream overhead with wild melancholy cries during the long dark nights, changing their locality as food becomes scarce, or security hard to obtain. To be ignorant of these birds and of the fact and the causes of their migrations, is to cut one's self off from much of the pleasure of rural life.

If for no other reason, the *Summer Migrants*\* of Mr Harting would be gladly welcomed, as giving an account of the birds which lend a special charm to spring and summer, from the point of view of one thoroughly competent to treat the subject. But the book has further claims for favour, as being tastefully bound, printed at the Chiswick Press in type of grateful aspect, and illustrated by Bewick's celebrated wood-engravings. How delicately that engraver could appreciate the characteristics of birds, compelling his art to imitate the marking of their feathers, so as to vie closely with the resources of colour, may be well discerned by studying the attractive examples arrayed in the book before us.

Two great waves of migratory birds sweep over our land annually. Many ducks, waders, &c., visit us late in autumn, and stay through much of the winter; while the singing birds cross over in spring, and remain during the other half of the year. When the Royston crow, fieldfare, sheldrake, and many others, depart for other shores, nature sends over from the south the second division, the soft-billed birds, which are for the most part insectivorous, though many of them do not disdain fruit. Whether their northward movement be due to instinct, bidding them build nests and rear young ones, or to a physical impulse independent

\* *Our Summer Migrants*. By J. E. Harting, F.L.S. Bickers and Son. 1875.

of the will, is yet a moot point. At all events, their arrival is extremely beneficial to man, as they destroy numberless insect pests, and render home more pleasant in the hot months. This spring immigration begins with the arrival of the willow-wrens in the middle of March, and extends to about May 12, when the fly-catcher, the last of our summer visitors, makes its appearance.

Who has not felt a thrill of pleasure as the welcome notes of some returned wanderer fall upon the ear, or its familiar flight again charms the eye? Chaucer does but express the universal delight of all country lovers at their coming:

On every bough the birdis herd I syng  
With voice of angell in their harmonie,  
That busied them ther birdis forthe to bryng.

Owing to weather, food, or lingering attractions in the south, our feathered friends vary the times of their reappearance. The variation, however, is very slight, and the discrepancy, one year with another, is but a few days.

The object of Mr Harting being to bring together the latest observations on the extent and mode of performing the summer migration, together with notices of the winter-homes of the different species of migrants, a pleasant paragraph concisely sums up what these birds are, with their haunts: 'Upon the wild open wastes and commons, we find the chats, to which family belong the whin-chat, the stone-chat, and the well-known wheat-ear. In the hedgerows and copses are to be seen the three species of willow-warblers: the wood-wren, willow-wren, and chiff-chaff. Wooded gardens and fruit-trees attract the garden-warbler, black-cap, and white-throats; and the thick sedges and waving flags by the waterside shelter the various species of river-warblers. In the open meadows and moist places by the river-bank or sea-coast, we need not search long to find the pipits and wagtails; and while the fly-catchers perch familiarly on our garden-walls, or pick the aphids off the fruit-trees, the swallows build under our very eaves, and claim our protection for their young. High above all, the noisy swift holds his rapid, wondrous flight, wheeling and screaming to his heart's content.'

Forty-nine species are treated; but many of these acquire the doubtful claim of being British, because they have on very few occasions been captured or seen in the United Kingdom. No one, save a professed ornithologist, has much chance of meeting such rarities as Savi's warbler, or the Pennsylvanian pipit, or the Alpine swift; and it may be added, none but a skilful naturalist would be able to identify many of these rarities, were he to see them. Such birds, too, as the hoopoe and golden oriole, are not merely scarce, but circumscribed as to locality. Of birds unfamiliar to ordinary observers, or that are met with only in certain districts, sixteen may be subtracted from the forty-nine species, leaving thirty-three to be considered. On examining these, however, it seems that Mr Harting has incorporated the gray wagtail (*Motacilla boarula*) with his list, for the purpose of convenient comparison with its congeners; the bird being really a winter migrant, though stationary all the year in Dartmoor and the west of England generally. So that

thirty-two species remain as the number of British summer migrants likely to fall under the notice of ordinary bird-lovers.

These we will group together in three classes, which may be distinguished as the warblers, the wagtails, and the swallows, and then taking the few that remain, the single representatives of their own families, a tolerable conspectus will be obtained of the subject.

First in honour as in extent come the *Sylviidae* (warblers), to which great family the larger portion of English summer migratory birds belong. Amongst these, the wheat-ear and the chiff-chaff are generally the earliest to arrive. The wheat-ear has a geographical range extending from the Faroe Isles to Armenia, and must be well known to every one wont in early spring to walk on open commons or by the sea, from its practice of incessantly flitting on in front of the pedestrian. Of the stone-chat many individuals remain with us all the year, while its kinsman the whin-chat is wholly migratory. The latter sprightly bird is far more common than the stone-chat, and may often be seen on the furze bushes which give it a name, uttering its curious cry '*U-leek!*' Under the next species come the wood-wren, the willow-wren, and the chiff-chaff, for the most part insect-eating birds. The first two are identified with our woods and thick hedges, the last more with gardens and orchards. Small as these three birds are, and utterly unequal, as it might be thought, at first sight, to long aerial voyages, it must not be forgotten that the golden-crested wren, the smallest of British birds, comes over to the eastern coast in great flights during the stormy weather of autumn. The most remarkable fact about the nightingale is its partial distribution, not merely through our islands, but also through England. Though found in Sweden, it is unknown in Wales, Ireland, and Scotland; and even in England, a line drawn from Dorset, with a curve to the Wye, and so round to Norfolk, includes its province. It is occasionally found in Derbyshire and near York; but being a short-winged bird, disinclined, apparently, to long flight, it crosses the Channel at its narrowest part, and merely spreads over a wedge-shaped extent of country on this side, at once devoting itself to nesting cares. Next come other tribes of warblers, the black-cap, garden-warbler, and greater and lesser white-throats. The former two of these birds are admirable singers, much persecuted by bird-catchers; the black-cap is at once distinguishable by its black-crested head; while the garden warbler is not unlike the female black-cap. They are shy, restless birds, locally distributed. It is interesting to remember that Gilbert White was wont to identify the black-cap's notes with the song of Amiens in the Forest of Arden:

Under the greenwood tree,  
Who loves to lie with me,  
And tune his merry note  
Unto the wild bird's throat.

Most country boys have taken white-throats' nests, with their green-blotched eggs, in the nettles and low brushwood of some retired lane. These birds are fond, however, of resorting with their young to our gardens and orchards, and do not disdain raspberries, currants, and the like. Nowhere very largely represented, yet a sufficiently familiar bird,

from its habits and colour, is the redstart, another summer migrant. It helps to free the lawns and fruit-trees from the numberless beetles, flies, and caterpillars that infest them. The last species of the migratory *Sylviidae* must be sought by the reeds and sedges of water-courses, away from man's dwellings. These are (omitting the rarer varieties) three in number—the reed-warbler, the sedge-warbler, and the grasshopper-warbler. Shy, timid songsters, the first two may be heard near their favourite localities, though their activity is such that it is almost impossible to obtain a favourable view of them. The nest of the reed-warbler is a beautiful object, suspended between the stems of three or four tall reeds overhanging the water. The grasshopper-warbler is remarkable for the late hours to which it will sing; often have we heard its curious 'chirring' from the neighbouring thicket just before midnight, while the cuckoo (itself a nocturnal singer) was telling her name afar off to the silent woods.

The *Motacillidae*, which include the wagtails and, in deference to Professor Newton, the pipits, next demand notice. The common (or pied) wagtail is only a partial migrant, many individuals remaining here throughout the year; but they have been seen in large flocks, during the mornings of September, flying parallel to the Sussex coast, towards the east. The Kentish coast gained, the Channel passage is easy even to young birds of the year. They were observed to return about the middle of March. The pretty yellow wagtail similarly collects in small family parties, which coalesce into flocks during the first week in September; and then leave our shores for North Africa, some even penetrating to Natal and Angola. Its beautiful yellow markings and cheerful flight athwart the water-meadows, endear it to the naturalist. Of our three familiar species, the pied wagtail may be called the wagtail of the house; the yellow, that of the fields; and the gray (*M. boarula*), that of the river-side. These are respectively their haunts. As for the pipits, both the meadow-pipit (titlark) and the rock-pipit are residents throughout the year; but they move to a certain extent from one part of the country to another; and, as Professor Newton explains it, 'though resident as species, they are migratory as individuals.' Every one knows the titlark, and associates it with fine summer weather, and meadows waving with hay. The rock-pipit is found, as becomes its name, on all our coasts, save the line which lies between the Humber and the Thames. The tree-pipit passes the winter in North-west India and the Jordan Valley, and even, as is suspected, in China and Japan; coming to England in April. It is remarkable amongst the birds of the woods and fields for its singular mode of flying up from the top of a bush or tree, and descending in full song, with its legs hanging straight down. Once seen, this curious characteristic cannot be forgotten.

The Swallow family (*Hirundinidae*) constitutes the third great group of migratory birds. Its earliest visitor to England is the pretty little sand-martin; the swift comes latest of the family, and departs first, generally about the third week in August. Every one knows that the food of the swallows consists of flies of various kinds. Like birds of prey, they eject the indigestible portions of their insect food in small pellets. Their geograph-

ical range is extensive. The chimney swallow spends its summer in Europe, going as far north as Iceland; and returns to Sierra Leone, Algeria, Cairo, and as far east as the Holy Land. A species which is almost, if not quite identical, is found generally distributed in China, Japan, and North-western India. The sand-martin, however, extends its summer range to North America and California. The swift retreats from winter as far as the Cape of Good Hope.

Among the migrants which do not fall under these three heads, first should be mentioned our two species of fly-catchers. The spotted fly-catcher is a common garden visitor, frequently building in trellis-work, and always welcomed on account of its pretty trustful ways. It is one of the latest of the migrants to arrive, seldom coming before the second week of May, as it is dependent on a good supply of flies. Then it spreads itself over the land from Dover to Caithness, though more sparingly found in Scotland. Spite of its weak flight, its range extends from Lapland to the Cape of Good Hope, and from Portugal to Palestine. As we write, a pair are feeding their young in a nest placed in ivy above the window. A singular display of instinct occurred in connection with this nest. Ordinarily, a brood consists of four or five; but as this nest was built very carelessly, the old birds seemed aware that that number would be too many, and no more than two eggs were laid. When these were hatched, the nest dropped to one side so dangerously that a young bird twice fell on to the lawn below, luckily without being injured. We procured a ladder, and replaced it, much to the old birds' delight; and the little ones are now just about leaving the nest; their curious spotted plumage being, even in these early days, well developed. That handsome bird, the pied fly-catcher, is more locally distributed, though one might add Notts to the counties in which Mr Harting mentions it has occurred.

Most persons who have lived in a sandy fern-covered woodland district have noticed the monotonous 'churning' of the nightjar in the evening. This nocturnal bird spends the winter in North Africa, and devotes itself to ridding us of the large white moths which are so common during the summer months. One of the most curious facts which modern science has discovered respecting the cuckoo is, that it does not pair, but is polygamous—a kind of chartered libertine of the fields and groves. Its egg is not unlike a house-sparrow's in size and colour, and is very small, relative to the size of the bird. It, too, winters in North Africa. The wryneck is a cheerful little bird, eagerly welcomed in the south and west of England in April, but uncommon elsewhere. Mr Harting states that its distribution much resembles that of the nightingale, but we know it in Devon, where the nightingale seldom or never penetrates. The red-backed shrike or butcher-bird is another bird of the southern and midland counties of England, easily recognised, and a visitor to us from Africa. The last two of our migratory summer birds are widely different in habits—the turtle-dove and the corn-crake. Neither can be called common anywhere, and both are capricious in their choice of a locality, frequenting it one summer, and deserting it next year. We have once only seen the turtle-dove, when it alighted on a gravel-walk to procure small pebbles for digestion.

In the midland counties, the corn-crake utters its harsh notes all night from the hay-fields. Mr Blake Knox thinks that it hibernates in Ireland, but this hypothesis requires corroboration. Gilbert White fancied (as many ignorant folks still do) that the swallow hibernated under water, or in a hollow tree.

To complete this list, it should be mentioned that Mr Harting has forgotten to name three well-known migratory birds in summer, it may be from his thinking them too local for a general manual. The hobby, which, spite of its small size, is a true falcon, and has, according to Yarrell, a range in England somewhat like that of the nightingale, appears in April, and leaves our shores again about October. The ring-ousel is much better known, and is common in every mountain district from spring to autumn. For example, on the lonely tors of Dartmoor, amongst the deserted works of the old 'streamers' (as the natives call the early diggers for tin), the ring-ousel constantly flits before the pedestrian, so that the bird must certainly be included in every list of summer immigrants. The third bird, the thick-knee or stone-plover, possesses a peculiar interest, from its having been one of the favourite birds of the historian of Selborne. He dwells upon the propriety of the scientific name (*edicnemus*), 'since their legs seem swollen like those of a gouty man,' and notices their nocturnal calls as they arrived on March 1st in the year 1788. He deems them the first summer birds to come back. From the beginning of April to August or September may be regarded as the length of their stay in the eastern and southern counties of England.

One or two questions respecting our summer visitors remain, and brief answers to them will aptly conclude the subject. We have seen that the Riviera, Italy, Algeria, Egypt, and Africa generally, together with Palestine, and even India, are the winter resorts of these birds; do they breed in these winter quarters? The late Mr Blyth, who had singular opportunities for observation, asserted that the sand-martin was the only British summer visitant which nested in its winter quarters. Mr Harting, however, thinks that the same holds good with the swallow, the wryneck, the turtle-dove, and the butcher-bird. Careful observation and time will alone decide the knotty point.

Many facts have been gathered respecting migratory habits, but a great many more are yet wanting. Indeed, the *modus operandi* of migration is a subject to which all ornithologists ought to direct special attention. As a general rule, the male birds of each species arrive in this country some days before the females. Colonel Irby, who made observations on migration at Gibraltar and Tangiers, found that most of the land-birds passed the Straits by day, usually in the morning. The waders crossed, he deemed, for the most part at night. The return journey of all the birds was generally accomplished during night, and both trips during an east wind. Mr Cordeaux, who has paid attention to the migration of birds in Lincolnshire, in his *Birds of Lincolnshire* agrees with this statement, believing that the greater portion of our summer migrants (with the exception of the cuckoo) come from the sea with an east or south-east wind. If the book before us induces observers to devote themselves to answering these and the like problems, it will have attained a worthy end, and one

which no one would more rejoice in than its scholarly author. Meanwhile, we commend the whole subject to the more careful and exact amongst the lovers of our native birds.

## THE FLAG OF DISTRESS.

### CHAPTER XXIV.—HARRY BLEW HOMELESS.

WHILE the exciting scene described as taking place in the El Dorado was at its height, Harry Blew went past the door. Could the sailor have seen through walls, he would have entered the saloon. The sight of his former officers would have attracted him inside; there to remain, for more reasons than one. Of one he had already thought. Conjecturing that the young gentlemen might be going on a bit of a spree, and knowing the dangers of such in San Francisco, it had occurred to him to accompany, or keep close after them—in order that he might be at hand, should they come into collision with any of the roughs and rowdies thick upon the street. Unfortunately, this idea, like that of asking them for a cash loan, had come too late; and they were out of sight ere he could take any steps towards its execution. A glance into the gambling-saloon would have brought both opportunities back again; and, instead of continuing to wander hungry through the streets, the sailor would have had a splendid supper, and after it a bed, either in some respectable hostelry, or his old bunk aboard the *Crusader*. It was not to be. While passing the El Dorado, he could know nothing of the friends that were so near; and thus unconscious, he leaves the glittering saloon behind, and a half-score others lighted with like brilliancy. For a while longer he saunters slowly about, in the hope of yet encountering the officers. Several times he sees men in uniform, and makes after them, only to find they are not English. At length giving it up, he quickens his pace, and strikes for the office of the ship-agent, which he knows to be in the street fronting the water. As San Francisco is not like an old seaport, where house-room is cheap and abundant, but every foot of roof-shelter utilised by night as by day, there is a chance the office may still be open. In all probability, the agent sleeps by the side of his ledger; or if not, likely enough one of his clerks. In which case he, Harry Blew, may be allowed to lie along the floor, or get a shake-down in some adjoining shed. He would be but too glad to stretch himself on an old sack, a naked bench, or, for that matter, sit upright in a chair; for he is now fairly fagged out perambulating the unpaved streets of that inhospitable port.

Tacking from corner to corner, now and then hitching up his trousers, to give freer play to his feet, he at length comes out upon the street which fronts towards the bay. In his week's cruising about the town he has acquired some knowledge of its topography, and knows well enough where he is; but not the office of the shipping-agent. It takes him a considerable time to find it. Along the water's edge the houses are irregularly placed, and numbered with like irregularity. Besides,

there is scarce any light; the night has become dark, with a sky densely clouded, and the street-lumps burning whale-oil are dim, and at long distances apart. It is with difficulty he can make out the figures upon the doors. However, he is at length successful, and deciphers on one the number he is in search of—as also the name 'Silvestre,' painted on a piece of tin attached to the side-post.

A survey of the house—indeed, a single glance at it—convinces him he has come thither to no purpose. It is a small wooden structure, not much bigger than a sentry-box, evidently only an office, with no capability of conversion to a bedroom. Still it has room enough to admit of a man's lying at full length along its floor; and, as already said, he would be glad of so disposing himself for the night. There may be some one inside, though the one window—in size corresponding to the shanty itself—looks black and forbidding. With no very sanguine hope, he lays hold of the door-handle, and gives it a twist. Locked, as he might have expected! The test does not satisfy him, and he knocks. At first timidly; then a little bolder and louder; finally, giving a good round rap with his knuckles, hard as horn. At the same time he hails sailor-fashion:

'Aboy, there; be there any one within?' This in English; but, remembering that the ship-agent is a Spaniard, he follows his first hail with another in the Spanish tongue, adding the usual formula: '*Ambre la puerta!*' Neither to the question nor the demand is there any response. Only the echo of his own voice reverberated along the line of houses, and dying away in the distance, as it mingles with the sough of the sea. No use speaking, or knocking again. Undoubtedly, Silvestre's office is closed for the night; and his clerks, if there be any, have their sleeping-quarters elsewhere. Forced to this conclusion, though sadly dissatisfied with it, the ex-man-o'-war's man turns away from the door, and once more goes cruising along the streets. But now, with no definite point to steer for, he makes short tacks and turns, like a ship sailing under an unfavourable wind—or as one disregarding the guidance of the compass, without steersman at the wheel.

After beating about for nearly another hour, he discovers himself again contiguous to the water's edge. His instincts have conducted him thither—as the seal, after a short inland excursion, finds its way back to the beach. Ah! if he could only swim like a seal! This thought occurs to him as he stands looking over the sea in the direction of the *Crusader*. Were it possible to reach the frigate, all his troubles would soon be forgotten in the cheerful companionship of his old clams of the fore-castle. It can't be. The man-o'-war is anchored more than two miles off. Strong swimmer though he knows himself to be, it is too far. Besides, a fog has suddenly sprung up, overspreading the bay, so that the ship is hidden from his sight. Even those lying close inshore can be but faintly discerned through its film, and only the larger spars; the smaller ones with the rigging-ropes looking like the threads of a spider's web.

Down-hearted, almost despairing, Harry Blew halts upon the beach. What is he to do? Lie down on the sand, and there go to sleep? There are times when on the shores of San Francisco Bay this would not be much of a hardship. But now, it is the season of winter, when the great Pacific
